

PRIMEPOS 1000

Small, Compact and light Point of Sale Systems is the current trend in the market. However, some people think this type of Point of Sale has to sacrifice its performance and operation for the advantage of saving space. We do not think that way. We are in fact introducing our Terminal Book Size Solution in the form of PrimePOS 1000.

PrimePOS 1000 though light and compact is packed with a powerful Intel socket 370-processor capable of supporting Celeron 733 Mhz or Pentium III 850 MHz. Standard memory is 128 MB but can be expanded up to 512 MB giving you lots of RAM to play with. Its 20 GB ATA100 hard disk drive provides high-speed data transmission and lots of area to store your sales.

6 Serial ports together with 4 USB ports enables you to connect all the peripherals needed for your POS System. This abundance in communication ports gives you the freedom to interconnect your systems and gives you access to endless possibilities.

Worrying what operating system to use? No problem, PrimePOS 1000 is compatible with most operating systems such as Microsoft Windows 95/98/2000/NT, DOS and it even runs on Linux.

The All-In-One Point Of Sale system usually connects peripherals together. When one of the peripherals breakdowns, you end up giving the entire POS unit for repair causing you inconveniences and bigger cost. Not with PrimePOS 1000. You can be assured that when a peripheral breakdowns, its only the peripheral concerned that needs to be repaired. How is it possible? PrimePOS 1000 is designed modularly. This design concept not only eases up the cost of repairs but also gives you flexibility.

Atop all of these, PrimePOS 1000 is backed by 12 months warranty against manufacturing defects and is supported by superb after-sales services.
