

How to use a mobile router

The wireless connection may not be able to be used when using a mobile router. ScanSnap cannot be connected via the Access Point Connect mode if a privacy separator function of the mobile router is enabled.

Hint

A privacy separator function is the function that disable communications between wireless devices via a mobile router in order to enhance security.

If the connection cannot be made via a mobile router, check the setting of the privacy separator function of the mobile router. Disable the privacy separator function if it is enabled.

Refer to the manual of the mobile router that you are using for the confirmation method of the privacy separator function setting and how to change it.

Some mobile routers cannot disable the privacy separator function. In that case, connect ScanSnap in the Direct Connect mode.

- Examples of mobile routers that the privacy separator function is enabled in the default setting:

- EMOBILE Pocket WiFi series
- SoftBank Pocket WiFi series
- Docomo Mobile Wi-Fi router HW series
- WiMax WMX series

Note: The privacy separator function of some of the models in the above series of routers may not be enabled

- Examples of mobile routers that the privacy separator function cannot be disabled:

- Logitech LAN-W300N/Rsx series

Please contact the mobile router manufacture of your mobile router information on the router or method to change the setting.
