Environmental Management Green Reference for Tomorrow

Environmental Management Dashboard

Reliably applying the PDCA cycle to environmental management, from sharing information to making operation decisions concerning environmental activities

[Environmental Management Dashboard](#) | [Case Study](#)

The Environmental Management Dashboard is an information system intended to perform genuine environmental management, by collecting and analyzing information which executives and managers in charge of energy management need to make decisions and judgments and employees require to guide their autonomous activities: the most advanced information from a variety of sources ranging from management information to environmental information, and applying these types of information according to the users and their goals.

Measures to continuously provide information to people who require it according to each person's goal

Corporations must now practice environmental management which ensures both the growth of

business and reduction of environmental loads. The infrastructure needed to implement such management is a system which provides information to people who require it to conserve energy and conduct environmental preservation activities, according to each person's goals.

Several questions must be answered. "How much energy does the entire company, business facilities and divisions, buildings and floors, and individuals, use?" "For what purposes do they use it?" "When do they use it?" "What kinds of initiatives do they take to conserve energy?", and "How effective are these measures?" The types of information which people wish to obtain vary according to their posts and roles; executives, managers in charge of energy management, business division directors, or employees etc. The Environmental Management Dashboard is a portal simplifying the acquisition of information suited to the needs of each such player.

Accelerating the PDCA Cycle in Environmental Management

The Environmental Management Dashboard collects and processes information required by environmental activities from various Group sources and provides it at times appropriate to the needs of each user.

It supports energy management by providing environment managers with monthly alerts of target CO₂ emissions for each business facility, comparing CO₂ emissions with those in the same month of the previous year and in the previous month, and accessing comparisons of CO₂ emissions per unit area of each business premise. Employees can efficiently take actions to save energy, permitting the immediate confirmation of the state of electric power use in each division.

The Environmental Management Dashboard accurately repeats the PDCA cycle "infinity loop", for genuine environmental management, ranging from the company-wide level to the organization and individual levels.

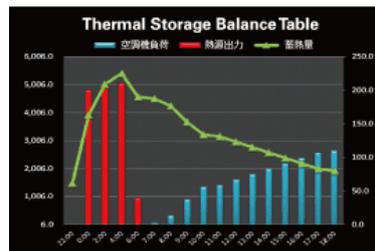

Purposes for which various players use the Environmental Management Dashboard

 Executives	▶ To make decisions and business judgments to practice environmental management
 Business Division Leaders	▶ To Discover unreasonable, wasteful, and fluctuating manufacturing activities
 Factory Managers	▶ To verify and improve equipment operating processes
 Employees	▶ To improve each employee's motivation to save energy
 Environmental Managers	▶ To clarify and improve the state of use of energy and environmental loads

Examples of Information applied to Environmental Management

Visualizing various kinds of information needed to manage energy. This leads to effective actions while observing the state of energy use and degree of achievement of energy conservation measures.

Comparing the quantity of heat stored with the air-conditioning load

Comparison of maximum electric power and of the quantity of electric power
