FUJITSU

Accelerating application integration on enterprise platform

Case study: Large Government Agency

Accelerating cloud-native innovation of modern applications

Challenge

This Government Agency has been a national leader in the establishment of digital hospitals and needed to replace a complex and outdated application integration technology.

Solution

An Enterprise Interoperability Platform (EIP) was identified and implemented as the optimal solution. Fujitsu provided its local Data Centre for cybersecure iaaS to host the EIP.

Outcomes

The EIP is now used by all state public health services in metropolitan and regional areas to share clinical and operational data in real time.

Clinicians can view data from other hospitals and services such as pathology at any time (with appropriate security and access) without having to open multiple applications.

"There is now better-quality patient information and sharing of patient care insights."
