

# Microsoft 365 security enhancement

Case study

Fujitsu Cyber Security Services (FCSS) successfully concluded a pivotal Microsoft 365 Assessment Accelerator for a major agricultural corporation, addressing key cybersecurity challenges within their Microsoft 365 environment.

## Challenge

This project, aimed at bolstering the customer's security posture, involved a comprehensive assessment and analysis of their Microsoft 365 configuration against the robust Perimeta for 365 baselines.

## Solution

Through meticulous planning and collaboration, FCSS's subject matter experts worked closely with the customer to discover current configurations, assess them for security gaps, and plan for an enhanced security framework. This collaboration led to identifying critical configuration gaps and major misconfigurations, providing the customer with a detailed analysis and recommended uplift actions.

## Outcomes

The engagement not only delivered a strategic roadmap for improving the customer's security posture but also demonstrated advanced features of Perimeta for 365, emphasising its potential to manage compliance and configuration drift over time effectively. Post-implementation, the customer experienced a significant uplift in their security measures, ensuring a robust defence mechanism against potential cybersecurity threats and aligning with their high-level security objectives within the Microsoft 365 ecosystem.
