

Transforming the digital landscape of a key Government Agency

Case study

Fujitsu Cyber Security Services (FCSS) successfully completed a transformative project with a key Government Agency, leveraging Microsoft 365 Professional Services. The initiative was aimed at modernising collaboration tools while enhancing cybersecurity measures.

Challenge

The Department faced significant challenges in securing its digital communication and collaboration environment. With the growing threat landscape, there was an urgent need to implement a secure, flexible, and efficient solution to support its operations.

Solution

FCSS delivered a comprehensive Microsoft 365 solution, including the deployment of a Protected Utility blueprint and the Perimeta for 365 service. This approach streamlined service design, de-risked the deployment, and expedited delivery. The project encompassed an engage phase to document business requirements, a build phase for targeted service implementation, and a use case uplift phase to refine Microsoft 365 services aligned with specific business processes.

Outcomes

Post-implementation, the Department experienced enhanced security and compliance across its digital platforms, improved collaboration efficiency, and reduced operational risks.

The solution provided a scalable framework that supported the Department's complex requirements, enabling a more agile and secure working environment.
