

Hassle-free transformation for AWS

Modernisation

Fujitsu Cloud Service for AWS **Modernisation** keeps you on-track so you can exploit the benefits of AWS faster.

Making the move to AWS for leading development tools and cutting edge technologies can transform the way you operate. Modernising any element of IT is never simple. Particularly when you choose to transition to, or aim to make best use of AWS Cloud. It is not just applications and databases you have to consider. There is also your IT infrastructure, network, and connectivity. You need to take into account how you will transform the people, services, and governance you already have in place.

Fujitsu Cloud Service for AWS includes **Modernisation**. We know that the transition to AWS is a chain of activity that is only as good as its weakest link. Every aspect of the organisation must evolve in tandem to see true success. So we provide detailed modernisation services that address complexity and keep your project on-track. We look at each layer – applications, databases, infrastructure and the organisation. Then we help you re-purpose what you have for a smooth transition to AWS.

Key benefits

- Tailored delivery of the most cost-effective modernisation options.
- Proven Fujitsu methodologies, aligned to the AWS cloud.
- Transparent pricing for variable or fixed deliverables.
- A focus on business impact, not just IT upgrades.

Why Fujitsu

- We manage thousands of applications and infrastructure environments across the globe.
- We have five global cloud hubs and over 400 dedicated cloud support staff.
- We have the broadest set of technical capabilities in the industry and manage over 5,000 Hybrid IT implementations, and a network of over 30 cloud platforms.

What can I expect?

Fujitsu Cloud Service for AWS **Modernisation** delivers additional agility, lower cost operations and enables your organisation to benefit from the leading hyperscaler. It is delivered in a standardised programmatic manner that cuts complexity from your transformation across the three keys areas that can make or break your migration to AWS.

Infrastructure and Connectivity Modernisation

We can engineer, build, configure, and test your estate for AWS. Our experts can design and build to your bespoke requirements, including integrating your on-premise tooling, compliance, and regulatory requirements.

We can even directly connect your on-premise IT and users to the AWS cloud, to support you to mitigate online threats with a dedicated connection.

Application and Database Modernisation

When you have plenty of applications and databases to move to AWS, we work with you to prioritise the migration. Our teams then take one of three routes. They can:

- Re-host your application in the cloud at a fixed time and cost.
- Re-platform your application – upgrading infrastructure components or moving to cloud services.
- Re-architect and completely re-imagine your application following cloud native principles.

Organisational Modernisation

Fujitsu also recognises that adopting AWS is not just about the technical changes. We know it will have an impact on your operations too. So our transformation consultants help you develop a change program.

This will cover your people, your services and your business processes so they are ready to fully exploit the benefits of AWS.
