Interstage i-Flow V5.2

Interstage i-Flow is a full-featured Business Process Management (BPM) solution that enables businesses to react quickly to changing market requirements, competitive challenges, and customer demand.

With i-Flow, processes become repeatable and measurable, enabling managers to analyze and improve process performance. The results—reduced setup time, reduced costs, improved quality and increased profits through improved work productivity.

BPM is the leading way for managing business process logic in applications. It enables enterprises to extract the business logic into reusable business process components instead of hard-coding the frequently changing logic into applications. The resulting process layer is easy to understand and empowers managers to implement change requests immediately without technical assistance.

Customizable Components

Fujitsu Software’s award-winning i-Flow provides a rich browser-based, process-modeling environment and a Java-based process execution engine. i-Flow’s flexible architecture and advanced feature set enables enterprises to automate any type of business process that involves human collaboration and application integration.

i-Flow includes six fully customizable, out-of-the-box, browser-based JSP (Java Server Page) and Java Applet user interface modules that give your projects a jumpstart. These modules include:

- Development Manager
  An intuitive graphical modeling tool for defining and editing business processes. Used to modify processes at run-time, access tasks, and check process status and history.

What are the customers saying about Interstage i-Flow?

“We are especially impressed with i-Flow’s support for multiple application servers, the simplicity of its application programming interface, and its straightforward definition and management of workflows”

Steve Marra, VP of Marketing, Promeria

“In my experience, making changes as complex as the ones we made would normally take weeks if not months. Using i-Flow, iJET changed its business processes in two hours.”

Greg Meyer, CTO of iJET

“Our partnership with Fujitsu will make the industry’s best business process management technology an integral part of WorkSite MP, and give our customers what they need to operate efficiently, adapt to changing needs and streamline their business processes for maximum performance.”

Dan Carmel, VP of Marketing & Business Development, iManage
Flexible Architecture and Robust Features

i-Flow’s modular architecture provides customizable user interface components and adapters for seamless integration into existing IT infrastructures. i-Flow can be deployed on the leading J2EE application servers or as a standalone Java server, avoiding vendor lock-in. i-Flow supports transactional semantics, load balancing and failover, providing maximum reliability and scalability on the e-business platform of your choice. Fujitsu supplies APIs for the entire product functionality, enabling you to build truly unique, customized solutions. The following list describes a rich feature set that reduces your development time and costs:

- Advanced support for dynamic processes, allowing changes to be made in real-time.
- Process design and monitoring using web browsers, eliminating client software administration cost.
- Extensive support for sub processes, maximizing process reuse.
- Access to work using wireless devices, facilitating access to critical business processes anytime and anywhere.
- Sophisticated deadline and notification mechanisms, transforming operations from reactive problems into proactive solutions.

i-Flow’s Integration Adapters enable the i-Flow server to communicate with IT infrastructure components like document management systems, directory services, databases, wireless devices, and eMail systems. Document management and directory service adapter source code is available for customization and creation of new adapters. i-Flow’s flexible architecture leverages your existing IT infrastructure investments. It is an open architecture that can interoperate with third party integration adapters and future technologies. i-Flow enables you to orchestrate business processes in web services environment today.

System Requirements

Operating System
- Windows 2000
- Windows NT
- Sun Solaris
- HP-UX
- IBM AIX

Document Management System
- Java File System
- NT/Windows 2000 File System

Directory Services
- LDAP
- Windows 2000/NT User Manager
- Active Directory

Database
- Oracle 8.1.7, 9i
- SQL Server 7.0 and 2000
- DB2 7.1

Application Server
- Fujitsu Interstage 5.0
- BEA WebLogic 7.0
- IBM WebSphere 4.01

THE POSSIBILITIES ARE INFINITE
