### SPARC M10 Systems

XSCF Reference Manual for XCP Version 204x

Manual Code C120-E684-03EN March 2013 Copyright © 2007, 2013, Fujitsu Limited. All rights reserved.

Copying the 2016, rules to hind a function of the sector o Limited, and their applicable licensors, if any. The furnishings of this document to you does not give you any rights or licenses, express or implied, with respect to the product or technology to which it pertains, and this document does not contain or represent any commitment of any kind on the part of Oracle or Fujitsu Limited or any affiliate of either of them

This document and the product and technology described in this document may incorporate third-party intellectual property copyrighted by and/or licensed from the suppliers to Oracle and/or its affiliates and Fujitsu Limited, including software and font technology. Per the terms of the GPL or LCPL, a copy of the source code governed by the GPL or LGPL, as applicable, is available upon request by the End User. Please contact Oracle and/or its affiliates or Fujitsu Limited. This distribution may include materials developed by third parties. Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California.

UNIX is a registered trademark of The Open Group.

Oracle and Java are registered trademarks of Oracle and/or its affiliates.

Fujitsu and the Fujitsu logo are registered trademarks of Fujitsu Limited. SPARC Enterprise, SPARC64, SPARC64 logo and all SPARC trademarks are trademarks or registered trademarks of SPARC International, Inc. in the United States and other countries and used under license.

Other names may be trademarks of their respective owners. If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable: U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and protocourse and a sector specific supplementation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplementation, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government

Disclaimer: The only warranties granted by Oracle and Fujitsu Limited, and/or any affiliate in connection with this document or any product or technology described herein are those expressly set forth in the license agreement pursuant to which the product or technology is provided. EXCEPT AS EXPRESSLY SET FORTH IN SUCH AGREEMENT, ORACLE OR FUJITSU LIMITED, AND/OR THEIR AFFILIATES MAKE NO REPRESENTATIONS OR

WARRANTIES OF ANY KIND (EXPRESS OR IMPLIED) REGARDING SUCH PRODUCT OR TECHNOLOGY OR THIS DOCUMENT, WHICH ARE ALL PROVIDED AS IS, AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NONINFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID. Unless otherwise expressly set forth in such agreement, to the extent allowed by applicable law, in no event shall Oracle or Fujitsu Limited, and / or any of their affiliates have any liability to any third party under any legal theory for any loss of revenues or profits, loss of use or data, or business interruptions, or for any indirect, special, incidental or consequential damages, even if advised of the possibility of such damages.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright © 2007, 2013, Fujitsu Limited. Tous droits réservés. Oracle et/ou ses affiliés ont fourni et vérifié des données techniques de certaines parties de ce composant.

Oracle et / ou ses affiliés et Fujitsu Limited détiennent et contrôlent chacun des droits de propriété intellectuelle relatifs aux produits et technologies décrits dans ce document. De même, ces produits, technologies et ce document sont protégés par des lois sur le droit d'auteur, des brevets, et d'autres lois sur la propriété intellectuelle et des traités internationaux

Ce document, le produit et les technologies afférents sont exclusivement distribués avec des licences qui en restreignent l'utilisation, la copie, la distribution et la décompilation. Aucune partie de ce produit, de ces technologies ou de ce document ne peut être reproduite sous quelque forme que ce soit, par quelque moyen que ce soit, sans l'autorisation écrite préalable d'Oracle et/ou ses affiliés et de Fujitsu Limited, et de leurs éventuels concédants de licence. Ce document, bien qu'il vous ait été fourni, ne

sans lautorisation ecrite prealable d'Oracle et/ou ses affiliées et de l'uitsu Limited, et de leurs eventuels concedants de licence. Ce document, bien qui l'ous ait ete rourni, ne vous confère aucun droit et aucune licence, exprès ou tacites, concernant le produit ou la technologie auxquels il se rapporte. Par ailleurs, il ne contient ni ne représente aucun engagement, de quelque type que ce soit, de la part d'Oracle ou de Fujitsu Limited, ou des sociétés affiliées de l'une ou l'autre entité. Ce document, ainsi que les produits et technologies qu'il décrit, peuvent inclure des droits de propriété intellectuelle de parties tierces protégés par le droit d'auteur et/ou cédés sous licence par des fournisseurs à Oracle et/ou ses sociétés affiliées et Fujitsu Limited, y compris des logiciels et des technologies relatives aux polices de caractères. Conformément aux conditions de la licence GPL ou LGPL, une copie du code source régi par la licence GPL ou LGPL, selon le cas, est disponible sur demande par l'Utilisateur Final. Veullez contacter Oracle et/ou ses affiliés ou Fujitsu Limited. Cette distribution peut comprendre des composants développés par des parties tierces. Des parties de ce produit pourront être dérivées des systèmes Berkeley BSD licenciés par l'Université de Californie.

UNIX est une marque déposée de The OpenGroup. Oracle et Java sont des marques déposées d'Oracle Corporation et/ou de ses affiliés. Fujitsu et le logo Fujitsu sont des marques déposées de Fujitsu Limited. SPARC Enterprise, SPARC64, le logo SPARC64 et toutes les marques SPARC sont utilisées sous licence et sont des marques déposées de SPARC International, Inc., aux Etats-Unis et dans d'autres pays.

Tout autre nom mentionné peut correspondre à des marques appartenant à leurs propriétaires respectifs. Si ce logiciel, ou la documentation qui l'accompagne, est concédé sous licence au Gouvernement des Etats-Unis, ou à toute entité qui délivre la licence de ce logiciel ou l'utilise pour le compte du Gouvernement des Etats-Unis, la notice suivante s'applique :

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and / or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

Avis de non-responsabilité : les seules garanties octroyées par Oracle et Fujitsu Limited et/ou toute société affiliée de l'une ou l'autre entité en rapport avec ce document ou tout produit ou toute technologie décrits dans les présentes correspondent aux garanties expressément stipulées dans le contrat de licence régissant le produit ou la

tout produit out toute technologie decrite dans les presentes correspondent aux galanties expressentent supulees dans le contrai de necice regissant le product ou la technologie fournis. SAUF MENTION CONTRAIRE EXPRESSEMENT STIPULEE AU DIT CONTRAT, ORACLE OU FUJITSU LIMITED ET/OU LES SOCIETES AFFILIEES A L'UNE OU L'AUTRE ENTITE DECLINENT TOUT ENGAGEMENT OU GARANTIE, QUELLE QU'EN SOIT LA NATURE (EXPRESSE OU IMPLICITE) CONCERNANT CE PRODUIT, CETTE TECHNOLOGIE OU CE DOCUMENT, LESQUELS SONT FOURNIS EN L'ETAT. EN OUTRE, TOUTES LES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON, SONT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE. Sauf mention contenies organization en usant accordante da loure concidérée. contraire expressément stipulée dans ce contrat, dans la mesure autorisée par la loi applicable, en aucun cas Oracle ou Fujitsu Limited et/ou l'une ou l'autre de leurs sociétés affiliées ne sauraient être tenues responsables envers une quelconque partie tierce, sous quelque théorie juridique que ce soit, de tout manque à gagner ou de perte de profit, de problèmes d'utilisation ou de perte de données, ou d'interruptions d'activités, ou de tout dommage indirect, spécial, secondaire ou consécutif, même si ces entités ont été préalablement informées d'une telle éventualité.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTE AUTRE CONDITION, DECLARATION ET GARANTIE, EXPRESSE OU TACITE, EST FORMELLEMENT EXCLUE, DANS LA MESURE AUTORISEE PAR LA LOI EN VIGUEUR, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE À LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

## Preface

This manual describes the man pages for the XSCF firmware for SPARC M10 Systems from Oracle and Fujitsu.

Before reading this document, you should read the SPARC M10 Systems Quick Guide and the SPARC M10 Systems System Operation and Administration Guide.

The XCP firmware which is described in this document might no longer be the latest available version, or the version now installed on your particular server. For the current firmware release, always refer to the Product Notes for the firmware installed and the one for the latest firmware release.

This preface includes the following sections:

- Audience
- Related Documentation
- Text Conventions
- Notes on Safety
- Syntax of the Command-Line Interface (CLI)
- Documentation Feedback

## Audience

This guide is written for experienced system administrators with working knowledge of computer networks and advanced knowledge of the Oracle Solaris.

## **Related Documentation**

All documents for your server are available online at the following locations.

- Sun Oracle software-related manuals (Oracle Solaris, and so on)
  - http://www.oracle.com/documentation/
- Fujitsu documents

http://www.fujitsu.com/global/services/computing/server/sparc/ downloads/manual/

The following table lists documents related to SPARC M10 Systems.

#### Related SPARC M10 Systems Documents

\*. This is a printed document.

## **Text Conventions**

This manual uses the following fonts and symbols to express specific types of information.

Font/Symbol	Meaning	Example	
AaBbCc123	What you type, when contrasted with on-screen computer output. This font represents the example of command input in the frame.	XSCF> adduser jsmith	
AaBbCc123	The names of commands, files, and directories; on-screen computer output. This font represents the example of command output.	XSCF> <b>showuser -P</b> User Name: jsmith Privileges: useradm auditadm	
Italic	Indicates the name of a reference manual, a variable, or userreplaceable text.	See the SPARC M10 Systems Installation Guide.	
	IIndicates names of chapters, sections, items, buttons, or menus.	See "Chapter 2 Network Connection."	

### Command syntax in the text

While the XSCF commands have the section number of (8) or (1), it is omitted in the text. The Oracle Solaris commands have the section number such as (1M) in the text. Each command has the section number in a command name when prompting users to refer to it.

## Notes on Safety

Read the following documents thoroughly before using or handling any SPARC M10 Systems:

- SPARC M10 Systems Important Legal and Safety Information
- SPARC M10 Systems Safety and Compliance Guide

## Syntax of the Command-Line Interface (CLI)

The command syntax is as follows:

- A variable that requires input of a value must be put in Italics.
- An optional element must be enclosed in [].
- A group of options for an optional keyword must be enclosed in [] and delimited by |.

## Notation of This Manual

Here describes the notation used in this manual.

Intro(1) provides the XSCF shell commands and the brief description of them in the alphabetical order.

Each XSCF shell command is described in the order of sections below. When there's no relevant description provided, the section itself is omitted.

Section	Description	
NAME	This section gives the names of the XSCF shell commands, followed by a brief description of what they do.	
SYNOPSIS		ection gives the syntax of commands. e of font style complies with the following rule.
	bold	Enters the command name or the constants as displayed.
	Italic	Substitutes the variables and so forth with the appropriate values when the command executed.
		e of symbols such as parenthesis complies with the ing rule.
	[]	Brackets. The OPTIONS or OPERANDS enclosed in these brackets can be omitted. Those not enclosed can't be omitted.
	{ }	Braces. The OPTIONS or OPERANDS enclosed in these braces are treated as a unit.
		Separator. You should specify one of the OPTIONS or OPERANDS delimited with this symbol " ".
		Ellipsis. You can specify multiple OPTIONS or OPERANDS just before.
DESCRIPTION	This section gives the detailed description such as the command function. It describes the behavior after the command executed and the content to be displayed. It doesn't describe how to specify the OPTIONS or OPERANDS.	
Privileges	This section gives the privileges required for command execution. In case that what can be executed varies by the user privileges, it is described here.	
OPTIONS	This section gives the meaning of and how to specify the OPTIONS. In case the OPERANDS required for the OPTIONS, it is described here. To specify multiple 1-character OPTIONS, you may specify the first OPTION followed by the alphabetic part of the second.	
	e.g. fr	nadm -a -i fmadm -ai

Section	Description
OPERANDS	This section gives the meaning of and how to specify the OPERANDS. The OPERANDS which follows the OPTIONS are described in "OPTIONS."
EXTENDED DESCRIPTION	This section gives the description in case the supplementary explanation required in addition to the content written in "DESCRIPTION." Also used to divide the description prolonged in "DESCRIPTION."
EXAMPLES	This section gives the examples of command execution. The explanation of examples, the execution command, and the messages returned from the system as a result of execution.
EXIT STATUS	This section gives the status which shows whether or not the command executed normally terminated. "0" for normal termination, and ">0" for abnormal termination.
SEE ALSO	This section gives the related command names.

### Reference

## List of XSCF Commands

#### **NAME** | Intro - Displays the list of commands provided by the XSCF firmware.

#### DESCRIPTION

The Intro page lists the user commands (exit(1), man(1), and who(1)) and the system management commands (all commands starting with addboard(8)), which are provided by the XSCF firmware of the SPARC M10 Systems. The XSCF commands include the commands with the same names as ones of Oracle Solaris. However, their usages are not the same. For details, see the man page of each command.

XSCF supports the following commands.

exit	Ends the XSCF shell.
man	Displays the manual page of the XSCF shell command.
who	Displays list of user accounts logged in to XSCF.
addboard	Incorporates or assigns a system board (PSB) to a physical partition (PPAR).
addcodactivation	Adds the CPU core Activation key to the CoD database.
addfru	Adds the Field Replaceable Unit (FRU) and a cabinet.
addpowerschedule	Adds a schedule for powering on/off the automatic power control system (APCS).
adduser	Creates an XSCF user account.
applynetwork	Applies the contents of the XSCF network to the XSCF.
clearremotepwrmgmt	Deletes the management information of the remote power management function.
console	Connects to the control domain console.
deleteboard	Releases the system board (PSB) from the physical partition (PPAR) configuration.
deletecodactivation	Deletes the CPU core Activation key of the CoD from the CoD database.
deletefru	Removes the Field Replaceable Unit (FRU) or a cabinet.
deletepowerschedule	Deletes a schedule for powering on/off the automatic power control system (APCS).
deleteuser	Deletes an XSCF user account.
diagxbu	Diagnose crossbar cable and crossbar unit (XBU).
disableuser	Disables an XSCF user account.
dumpcodactivation	Saves the CPU core Activation key in a file.
dumpconfig	Saves the XSCF configuration information in a file.

enableuser	Enables an XSCF user account.
flashupdate	Updates the firmware.
getflashimage	Downloads an XSCF Control Package (XCP) image file.
getremotepwrmgmt	Obtains the settings file of the remote power management function.
initbb	Detach the SPARC M10-4S and the crossbar box from the system and initialize it to the factory default.
ioxadm	Manages the cards connected to the PCI Expansion Unit, link card, and host server.
nslookup	Refers to the Internet name server for the host name.
password	Sets the password of the XSCF user account and the effective period.
ping	Sends the ECHO_REQUEST packet of ICMP to the host on the network.
poweroff	Shuts down the physical partition (PPAR).
poweron	Starts the physical partition (PPAR).
prtfru	Displays the FRUID data on the system and the PCI Expansion Unit.
rebootxscf	Resets XSCF.
replacefru	Replaces the Field Replaceable Unit (FRU) and cabinet.
reset	Resets the specified physical partition (PPAR) or a logical domain (guest domain).
resetdateoffset	Resets the difference between the system time and the Hypervisor time of each physical partition (PPAR).
restorecodactivation	n Restores the CPU core Activation key.
restoreconfig	Restores the XSCF settings information.
restoredefaults	Restores the backup information or settings information of the unit mounted in XSCF to the default.
sendbreak	Sends a break signal to the control domain of the specified physical partition (PPAR).
setaltitude	Sets the altitude of the system.
setaudit	Manages the audit function of the system.
setautologout	Sets the session timeout time of XSCF shell.

setcod	Sets the Capacity on Demand (CoD) resource used in the physical partition (PPAR).
setdate	Sets the date and time of the XSCF clock.
setdomainconfig	Specifies the logical domain configuration when the physical partition (PPAR) is started.
setdualpowerfeed	Sets the dual power feed mode.
setemailreport	Sets the e-mail report function.
sethostname	Sets the host names and DNS domain names of the master cabinet and cabinets whose XSCFs are standby.
sethttps	Sets the start and halt of the HTTPS service used in the XSCF network. Also it performs authentication-related settings.
setlocator	Sets the blinking status of the CHECK LED of the operation panel.
setloginlockout	Enables or disables the lockout function when logging in.
setnameserver	Sets or deletes the name server and search path used in XSCF network.
setnetwork	Sets or deletes the network interface to be used in XSCF.
setntp	Sets the time synchronization for XSCF.
setpacketfilters	Sets the IP packet filtering rules used in the XSCF network.
setpasswordpolicy	Manages the password policy of the system.
setpcl	Sets the physical partition (PPAR) configuration information (PCL).
setpciboxdio	Configures each PCI slot setting of whether to enable the direct I/O function for PCI card mounted on PCI Expansion unit.
setpowercapping	Sets limitations for power consumption.
setpowerschedule	Sets the schedule operation information.
setpowerupdelay	Sets the warm-up operation time of the system and the wait time before start.
setpparmode	Sets the operation mode of the physical partition (PPAR).
setpparparam	Forcibly rewrites the OpenBoot PROM environment variables of the control domain.
setprivileges	Assigns the user privileges.

setremotepwrmgmt	Sets the remote power management function.
setroute	Sets the routing information of the XSCF network interface.
setsmtp	Sets the Simple Mail Transfer Protocol (SMTP) service.
setsnmp	Manages the SNMP agent.
setsnmpusm	Sets the User-based Security Model (USM) of the SNMPv3 agent.
setsnmpvacm	Sets the View-based Access Control Model (VACM) settings of the SNMPv3 agent.
setsscp	Assigns the IP address of the SP to SP communication protocol (SSCP).
setssh	Sets Secure Shell (SSH) service used in the XSCF network.
settelnet	Starts or halts Tenet service used in the XSCF network.
settimezone	Sets the time zone and summer time of XSCF.
setupfru	Sets the hardware of devices.
showaltitude	Displays the altitude of the system.
showaudit	Displays the current status of the audit system.
showautologout	Displays the session timeout time of the XSCF shell.
showbbstatus	Display the status of the SPARC M10 Systems cabinet.
showboards	Displays the information of the system board (PSB).
showcod	Displays the information of the Capacity on Demand (CoD).
showcodactivation	Displays the current CoD information stored in the Capacity on Demand (CoD) database.
showcodactivationhis tory	s Displays the logs of the Capacity on Demand (CoD).
showcodusage	Displays the usage of the Capacity on Demand (CoD) resources.
showconsolepath	Displays the information of the domain console that is currently connected to the physical partition (PPAR).
showdate	Displays the date and time of the XSCF clock.
showdateoffset	Displays the difference between the system time and the Hypervisor time of each physical partition (PPAR).

showdomainconfig	Displays the configuration information of the logical domain of the specified physical partition (PPAR).
showdomainstatus	Displays the status of the current logical domain.
showdualpowerfeed	Displays the status of dual power feed mode.
showemailreport	Displays the settings data of the e-mail report.
showenvironment	Displays the intake-air temperature and humidity, temperature sensor information, voltage sensor information, and fan rotation information of the system.
showfru	Displays the contents of settings regarding the hardware devices.
showhardconf	Displays the information of the Field Replaceable Unit (FRU) mounted on the server.
showhostname	Displays the host names set in the master cabinet and cabinets whose XSCFs are standby.
showhttps	Displays the status of the HTTPS service set in the XSCF network.
showlocator	Displays the status of the CHECK LED on the operation panel.
showloginlockout	Displays the time set in the lockout function of the user account.
showlogs	Displays the specified log.
showmonitorlog	Displays the contents of the monitoring message log in real time.
shownameserver	Displays the name server and the search path set in the XSCF network.
shownetwork	Displays the information of the network interface set in the XSCF.
showntp	Displays the NTP information set in the XSCF network.
showpacketfilters	Displays the IP packet filtering rule set in the XSCF network.
showpasswordpolicy	Displays the current password policy setting.
showpciboxdio	Displays each PCI slot setting of whether to enable the direct I/O function for PCI card mounted on PCI Expansion unit.
showpcl	Displays the physical partition (PPAR) configuration information (PCL) that is currently set.

showpowercapping	Displays the status of power consumption limitation.
showpowerschedule	Displays the schedule operation information.
showpowerupdelay	Displays the warm-up time and wait time for air conditioning of the system that is currently set.
showpparmode	Displays the operation mode of the physical partition (PPAR) that is currently set.
showpparparam	Displays the OpenBoot PROM environment variable of the control domain that is currently set in the specified physical partition (PPAR).
showpparstatus	Displays the status of the current physical partition (PPAR).
showremotepwrmgmt	Displays the settings of the remote power management function and the power status of the Node.
showresult	Displays the end status of the previously executed command.
showroute	Displays the routing information set in the XSCF network interface.
showsmtp	Displays the settings information of the Simple Mail Transfer Protocol (SMTP).
showsnmp	Displays the settings information and the current status of the SNMP agent.
showsnmpusm	Displays the current User-based Security Model (USM) information regarding the SNMP agent.
showsnmpvacm	Displays the current View-based Control Access (VACM) information regarding the SNMP agent.
showsscp	Displays the IP address assigned to the SP to SP communication protocol (SSCP).
showssh	Displays the contents of the Secure Shell (SSH) service set in the XSCF network.
showstatus	Displays the degraded Field Replaceable Unit (FRU).
showtelnet	Displays the status of the Telnet service set in the XSCF network.
showtimezone	Displays the currently set time zone of the XSCF and the summer time information.
showuser	Displays the XSCF user account information.

snapshot	Collects and transfers the data regarding environment, logs, errors, and Field Replaceable Unit Identifier (FRUID).
switchscf	Switches the status of XSCF in between master and standby.
testsb	Performs an initial diagnosis on the specified system board (PSB).
traceroute	Displays the network route to the specified host.
unlockmaintenance	Forcibly unlocks the XSCF that was locked during maintenance work.
version	Displays the version number of the firmware.
viewaudit	Displays the audit record.

## Reference

## **User Commands**

NAME	exit - Ends the XSCF shell.
SYNOPSIS	exit
DESCRIPTION	exit is a command to end and close the XSCF shell.
Privileges	No privileges are required to execute this command.
	For details on user privileges, see setprivileges(8).

exit(1)

NAME	man - Displays the manual page of the XSCF shell command.		
SYNOPSIS	man command_name		
	man -h		
DESCRIPTION	man is a command to display the manual page of the specified XSCF shell command.		
Privileges	No privileges are	e required to execute this command.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
OPERANDS	The following op	erands are supported.	
	command_name	Specify the command to display the manual page. You can make multiple specifications by separating them with spaces.	
		With "Intro" specified in <i>command_name</i> , the list of the XSCF shell commands is displayed.	
EXTENDED DESCRIPTION	If the manual page is long, it is divided by each screen for display. In this case, you can make an operation like the following using keys.		
	Key	Description	
	[Enter]	Displays the next one line.	
	Space	Displays the next one page.	
	[b]	Returns by half-page.	
	[q]	Interrupts the display of the manual page.	
EXAMPLES	EXAMPLE 1 Displ	ay the manual page of addboard(8).	
	XSCF> man add	XSCF> man addboard	
	EXAMPLE 2 Displ	ay the list of the XSCF shell commands.	
	XSCF> man Int	ro	
l			

#### man(1)

EXIT STATUS	The following exit values are returned.	
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	who - Displays list of user accounts logged in to XSCF.			
SYNOPSIS	who			
	who -h			
DESCRIPTION	who is a command to display list of user accounts logged in to XSCF.			
	The following information is displayed.			
	■ XSCF user account name			
	<ul><li>Terminal in use</li><li>Idle time</li></ul>			
	<ul> <li>Idle time</li> <li>Login time</li> </ul>			
	<ul> <li>Remote host name</li> </ul>			
Privileges	No privileges are required to execute this command.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-h Displays the usage. Specifying this option with another option or operand causes an error.			
EXAMPLES	<b>EXAMPLE 1</b> Display the list of user accounts logged in to XSCF.

# System Administration Commands

NAME	addboard - Incorporates or assigns a system board (PSB) into a physical partition (PPAR).		
SYNOPSIS	addboard [ [-q	[]-{y n}] [-f] [-c configure] -p ppar_id psb [psb]	
	addboard [ [-q	[]-{y n}] [-f]-cassign-p ppar_id psb [psb]	
	addboard [ [-q	]-{y n}] [-f] -c reserve -p <i>ppar_id psb</i> [ <i>psb</i> ]	
	addboard -h		
DESCRIPTION	addboard is a command to incorporate or to assign a system board (PSB) into a physical partition (PPAR) according to the PPAR configuration information (PCL). The addboard command is not available on SPARC M10-1/M10-4. You can specify any of the following incorporation methods.		
	configure Incorporates a PSB into the specified PPAR. The incorporated PSB can be assigned to a logical domain. If the PPAR is powered off, or if the Oracle Solaris of the control domain is not running the PSB is not incorporated, and it causes an error.		
	assign	Assigns a PSB to the specified PPAR. The assigned PSB is reserved for the specified PPAR, so the PSB cannot be incorporated in or assigned to any other PPAR. After assigning the PSB, the PSB is incorporated into the PPAR when the system is restarted or addboard with -c configure is executed.	
	reserve	Reserves incorporation of a PSB into the specified PPAR. The operation is the same as when -c assign is executed.	
Privileges	To execute this command, either of the following privileges is required.		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).		

#### addboard(8)

OPTIONS	The following options are supported.		
	-c assign	Assigns a PSB to PPAR configuration. If you omit the -c option, -c configure is assumed specified.	
	-c configure	Incorporates a PSB in PPAR configuration. If you omit the -c option, -c configure is assumed specified.	
	-c reserve	Reserves incorporation of a PSB into the specified PPAR. The operation is the same as when -c assign is executed.	
	-f	Incorporates a PSB in PPAR forcibly.	
		<b>Caution</b> – If a PSB is forcibly added to PPAR by specifying the -f option, all the added hardware resources may not run normally. For this reason, we recommend that users do not use the -f option during normal operation. If you specify the -f option, be sure to check the conditions of the added PSB and other devices.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID to which a PSB is incorporated or assigned. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
	- đ	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
OPERANDS	The following operands are supported.		
	<i>psb</i> Specifies the PSB number of the PSB to be incorpor assigned. You can make multiple specifications by them with spaces. The specification format is below		
		$ \begin{array}{ll} xx-y \\ xx \\ y \end{array} & \begin{array}{l} \text{Specifies an integer from 00 to 15.} \\ \text{It is fixed to 0.} \end{array} $	
EXTENDED DESCRIPTION	<ul> <li>When you specify -c configure, a hardware diagnostic on the PSB is performed before the PSB is incorporated in PPAR. Therefore, it may take time to execute the command.</li> </ul>		

	<ul> <li>When you use addboard to assign or incorporate a PSB, you have to set the PCL by using setpcl(8).</li> </ul>			
	<ul> <li>If you execute a command while the PPAR is in power-on or power-off processing, the system enters in busy state. Execute the command again after the PPAR processing is completed.</li> </ul>			
	■ For details on PCL, see setpcl(8) and showpcl(8).			
	<ul> <li>Even if the PPAR is not running, you can execute addboard. However, if you specify -c configure while the PPAR is running to execute addboard, Logical Domains (LDoms) Manager needs to be running.</li> </ul>			
	<ul> <li>When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.</li> </ul>			
EXAMPLES	<b>EXAMPLE 1</b> Assign PSB 00-0, 01-0, 02-0, and 03-0 to PPAR-ID 0.			
	XSCF> addboard -y -c assign -p 0 00-0 01-0 02-0 03-0			
	<b>EXAMPLE 2</b> Assign PSB 00-0, 01-0, 02-0, and 03-0 to PPAR-ID 2 forcibly.			
	XSCF> addboard -f -c assign -p 2 00-0 01-0 02-0 03-0			
EXIT STATUS	The following exit values are returned.			
	0 Indicates normal end.			
	>0 Indicates error occurrence.

addboard(8)

NAME	addcodactivation - Adds the CPU core Activation key of the Capacity on Demand (CoD) to the CoD database.		
SYNOPSIS	addcodactivation [[-q] - {y n}] key_signature		
	addcodactivatio	n [[-q] - {y n}] [-u user] [-p proxy [-t proxy_type]] -F url	
	addcodactivatio	<b>n</b> [-V] [-{y n}] [-u user] [-p proxy [-t proxy_type]] -F url	
	addcodactivatio	<b>n</b> -h	
DESCRIPTION		tion is a command to add the specified CPU core Activation key to se on the service processor.	
	Activation key. I	xecuting this command, you need to obtain the CPU core For obtaining the CPU core Activation key, see the <i>SPARC M10</i> Operation and Administration Guide.	
Privileges	To execute this c	command, platadm privilege is required.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-F url	Specifies URL to be the destination of saving the CPU core Activation key. The following types of format are supported.	
		<pre>http://server[:port]/path/file https://server[:port]/path/file ftp://server[:port]/path/file file:///media/usb_msd/path/file</pre>	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-р proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-t proxy_type	Specifies the proxy type. Specify it with the -p option. You can specify any of http, socks4, and socks5. The default is http.	

	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.	
	-V	Displays detailed network activities. This option is used to diagnose network and server problems. It cannot be used with the -q.	
	-у	Automatically responds to prompt with "y" (yes).	
<b>OPERANDS</b>	The following op	perands are supported.	
	key_signature	Specifies the CPU core Activation key to be added to the CoD database. Enclose the CPU core Activation key in double quotation marks (") for specification.	
EXTENDED DESCRIPTION	When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		
EXAMPLES	<b>EXAMPLE 1</b> Add the copied CPU core Activation key.		
	<pre>XSCF&gt; addcodactivation "Product: SPARC M10-1 SequenceNumber: 116 Cpu noExpiration 2 Text-Signature-SHA256-RSA2048: SBxYBSmB32E1ctOidgWV09nGFnWKNtCJ5N3WSlowbRUYlVVySvjncfOrDNteFLzo : 11Sgrjnee9FyEYITT+ddJQ=="</pre>		
	Above Key will be added, Continue?[y n]: Y		
	<b>EXAMPLE 2</b> Adding CPU core Activation keys in a lump from the CPU core Activation key file, specified with the URL.		
	<pre>XSCF&gt; addcodactivation -F file:///media/usb_msd/cod_key.list Above Key will be added, Continue?[y n]: y done. successfully added Activation Key count : 10.</pre>		
		ing CPU core Activation keys individually from the CPU core Activation ile, specified with the URL.	
	<b>1_116.txt</b> Above Key wil do	activation -F file:///media/usb_msd/cod_key_M10- l be added, Continue?[y n]: y ne. added Activation Key count : 1.	

# **EXIT STATUS** | The following exit values are returned.

- 0 Indicates normal end.
- >0 Indicates error occurrence.

addcodactivation(8)

NAME	addfru - Adds the Field Replaceable Unit (FRU) and a cabinet.
SYNOPSIS	addfru
	addfru -h
DESCRIPTION	addfru is a command to add the FRU and a cabinet.
	It enables settings required for expansions, such as selecting, confirming, or inserting the FRU or a cabinet, interactively by using menu format.
	The following FRU and cabinet can be added by addfru.
	<ul> <li>Power supply unit (PSU)</li> </ul>
	■ SPARC M10-4S
Privileges	To execute this command, the fieldeng privilege is required.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	<ul> <li>Before a SPARC M10-4S is added, it is necessary to set the IP address to the SP to SP communication protocol (SSCP) link of the additional SPARC M10-4S by using the setsscp(8).</li> </ul>
	<ul> <li>addfru can only be executed on the master XSCF. Attempting to execute it on a standby XSCF causes an error.</li> </ul>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	deletefru (8), replacefru (8), setsscp (8), showhardconf (8), testsb (8), unlockmaintenance (8)

addfru(8)

NAME	addpowerschedule - Adds a schedule for powering on/off the automatic power control system (APCS).		
SYNOPSIS	<pre>addpowerschedule {-p ppar_id  -a} -m daily {on= ontime  off= offtime  on= ontime off= offtime} term=value</pre>		
	<pre>addpowerschedule {-p ppar_id  -a} -m weekly {on= ontime  off= offtime  on= ontime off= offtime} pattern= week term= value</pre>		
	<pre>addpowerschedule {-p ppar_id  -a} -m monthly {on= ontime  off= offtime  on= ontime off= offtime} pattern= value term= value</pre>		
	<b>addpowerschedule</b> {-p <i>ppar_id</i>  -a} -m special {on= ontime  off= offtime  on= ontime off= offtime} date= value		
	addpowersched	<pre>ule {-p ppar_id  -a} -m holiday date= value</pre>	
	addpowersched	ule -h	
DESCRIPTION	addpowerschedule is a command to set a schedule for powering on/off the automatic power control system (APCS).		
Privileges	To execute this command, either of the following privileges is required.		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Adds a power control schedule for all PPARs.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-m daily	Adds a power control schedule to be repeated daily.	
	-m weekly	Adds a power control schedule to be repeated weekly.	
	-m monthly	Adds a power control schedule to be repeated monthly.	
	-m special	Adds a one-shot power control schedule.	
	-m holiday	Adds a pause of scheduled operation.	
	-p ppar_id	Specifies PPAR-ID for setting a schedule. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	

<b>OPERANDS</b>	I	The following operands are supported.
OI LIMITUDU		The following operations are supported.

on= <i>ontime</i>	Sets a time to po	wer on. To specify <i>ontime</i> , use the <i>hhm</i> <sup>0</sup> format.	
	hh	Specifies hours (in 24 hour format).	
	<i>m</i> 0	Specifies minutes (in 10 minute format).	
off=offtime	Sets a time to po	wer off. To specify <i>offtime</i> , use the <i>hhm</i> <sup>0</sup> format.	
	hh	Specifies hours (in 24 hour format).	
	<i>m</i> 0	Specifies minutes (in 10 minute format).	
term= <i>value</i>	Sets a period of conducting the scheduled operation. To specify daily, use <i>value</i> by using <i>MMDD-mmdd</i> format. To specify <i>value</i> for weekly and monthly schedule, use the <i>MM-mm</i> format.		
	MM	Specifies the starting month.	
	DD	Specifies the starting day.	
	mm	Specifies the ending month.	
	dd	Specifies the ending day.	
pattern=week	operation. To spe	he week for conducting weekly scheduled cify <i>week</i> , use the following formats. To specify ay of the week, separate them by inserting a en them.	
	sun	Specifies Sunday.	
	mon	Specifies Monday.	
	tue	Specifies Tuesday.	
	wed	Specifies Wednesday.	
	thu	Specifies Thursday.	
	fri	Specifies Friday.	
	sat	Specifies Saturday.	
patern= <i>value</i>	Specifies the date for conducting monthly scheduled operation. To specify <i>value</i> , use the <i>DD-dd</i> format.		
	DD	Specifies the starting day.	
	dd	Specifies the ending day.	

	date=value	suspending a one-	month, and year for conducting or shot schedule or a pause of scheduled ify <i>value</i> , use the <i>YYMMDD</i> format.
		ΥY	Specifies the last two digits of year (2000-2037).
		MM	Specifies a month.
		DD	Specifies a day.
EXTENDED DESCRIPTION	scheduled ope	erations are conducted	dded to enable the schedule of PPAR-ID, the ed. However, if the mode switch on the he operations are not conducted.
	<ul> <li>By using show checked.</li> </ul>	wpowerschedule(8)	), the contents of the added schedule can be
	■ To delete the a	added schedule, use	deletepowerschedule(8).
	<ul> <li>If non-existent abnormally.</li> </ul>	t <i>ppar_id</i> or time, or	past date or invalid option is specified, it ends
	■ Up to 4096 scl	nedules can be speci	fied in the entire system.
	<ul> <li>If two or more the following</li> </ul>		the same time, they are conducted in order of
	1. Pause of schee	dule (special)	
	2. One-shot sche	dule (holiday)	
	3. Monthly schee	dule (monthly)	
	4. Weekly sched	ule (weekly)	
	5. Daily schedul	e (daily)	
		nd power-off schedu ring off is conducted	le are set at the same time in the same order of d.
	add-spconfi configuration	g command on the information in XSCI	ion of the logical domain, execute the ldm control domain, to store the latest F. If you do not store the information, the ay fail to work properly.
EXAMPLES		a schedule of PPAR-I 9:00 to 21:30 daily.	D 1 that operates from January 1 to December 31,
	XSCF> <b>addpowe</b> <b>1231</b> XSCF>	erschedule -p 1 -	m daily on=0900 off=2130 term=0101-
	EXAMPLE 2 Add	a schedule of PPAR-II	O 1 that operates from February to April, from 7:10

#### addpowerschedule(8)

```
to 19:50 on every Monday, Tuesday, Wednesday, Thursday, and Friday.
```

```
XSCF> addpowerschedule -p 1 -m weekly on=0710 off=1950
pattern=mon,tue,wed,thu,fri term=02-04
XSCF>
```

**EXAMPLE 3** Add a schedule of PPAR-ID 1 that operates from first to fifth of May to June, from 9:20 to 18:40 daily.

```
XSCF> addpowerschedule -p 1 -m monthly on=0920 off=1840 pattern=01-
05 term=05-06
XSCF>
```

**EXAPLE 4** Add a schedule of PPAR-ID 1 that operates only on March 4, 2013 from 0:00 to 23:50.

XSCF> addpowerschedule -p 1 -m special on=0000 off=2350 date=120304

addpowerschedule(8)

NAME	adduser - Creates an XSCF user account.		
SYNOPSIS	adduser [-u UID] user		
	adduser -h		
DESCRIPTION	adduser is a command to create a new XSCF user account.		
	An XSCF user account is used for configuring, manipulating, managing, and operating XSCF. No password is set to the newly created user account. Therefore, set a password by using password(8), or set the public key for users by using Secure Shell (SSH). Otherwise, you cannot log in. The created user account is locked but not disabled. The number of user accounts to be specified is up to 100 assuming that a user account contains 10 characters on average.		
	SSL is set to be the user identif	ight Directory Access Protocol (LDAP), Active Directory, or LDAP/ used for the user account data on XSCF, the user account name and fier (if specified) must be the one that is not used for XSCF, LDAP, ry, or LDAP/SSL.	
	When you create a user account, the current value of the password policy is saved in the file for the created user account. For details on password policy, see setpasswordpolicy(8).		
Privileges	To execute this command, useradm privilege is required.		
	For details on u	user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-u UID	Creates a new user with the specified identifier (UID). For specifying <i>UID</i> , use an integer between 100 and 60000. If you omit the -u option, an integer greater than or equal to 100 is automatically assigned as a user identifier.	
OPERANDS	The following operands are supported.		
	user	Specifies the XSCF user account name to be created. For specifying a user account name, use up to 31 characters in combination of lowercase alphabets, numbers, hyphens (-), and underscores (_). No uppercase characters are available. Be sure to use a lowercase alphabet for the first character. The examples of user account name available are jsmith, j_smith, and j_smith-0123.	

# adduser(8)

EXAMPLES	EXAMPLE 1 Create	a new user.
	XSCF> <b>adduser</b>	-u 359 jsmith
EXIT STATUS	The following exit	values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	applynetwork - Applies the contents of the XSCF network to XSCF.		
SYNOPSIS	<b>applynetwork</b> [ [-q] - {y n}] [-M]		
	applynetwork -1	1	
DESCRIPTION	applynetwork is a command to apply the configured contents of the XSCF network to XSCF.		
	Use the following	g three procedures to configure contents of the XSCF network.	
	1. Use the follow	ring command to configure a network.	
	<ul> <li>Use sethor</li> </ul>	stname(8) to set the XSCF host name and DNS domain name.	
	<ul> <li>Use setname</li> </ul>	meserver(8) to set the name server and the search path.	
	<ul> <li>Use setnet</li> </ul>	twork(8) to set the IP address and netmask of XSCF-LAN.	
	<ul> <li>Use setron</li> </ul>	ute(8) to set a routing of the XSCF network interface.	
	<ul> <li>Use setss</li> </ul>	cp(8) to set the IP address of SSCP.	
	2. Execute apply	metwork to apply the configured contents to XSCF.	
	3. Execute rebootxscf(8) to reset all XSCF based on the applied contents.		
		set XSCF without executing applynetwork, the configured etwork is not applied. Not only that but the configured contents	
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	- M	Displays text one screen at a time.	
	-n	Automatically responds to prompt with "n" (no).	
	-đ	Prevents display of messages, including prompt, for standard output.	
	- Y	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press	

- For applying the XSCF network, the IP address and netmask of XSCF-LAN must be configured. If they are configured correctly, the configuration of the XSCF network cannot be applied.
- On a SPARC M10-4S, if the XSCF-LAN in up state is configured as described below, it causes an error. Use setnetwork(8) to correct the settings.
  - The subnets of xbbox#80-lan#0, xbbox#81-lan#0, and takeover IP addresslan#0 are all different.
  - The subnets of xbbox#80-lan#1, xbbox#81-lan#1, and takeover IP address lan#1 are all different.
  - Any of the subnets of xbbox#80-lan#0, xbbox#80-lan#1, and SSCP link is overlapped.
  - Any of the subnets of xbbox#81-lan#0, xbbox#81-lan#1, and SSCP link is overlapped.
  - Any of the subnets of xbbox#80-lan#0, xbbox#81-lan#1, and SSCP link is overlapped.
  - Any of the subnets of xbbox#81-lan#0, xbbox#80-lan#1, and SSCP link is overlapped.
  - The subnets of bb#00-lan#0, bb#01-lan#0, and takeover IP address lan#0 are all different.
  - The subnets of bb#00-lan#1, bb#01-lan#1, and takeover IP address lan#1 are all different.
  - Any of the subnets of bb#00-lan#0, bb#00-lan#1, and SSCP link is overlapped.
  - Any of the subnets of bb#01-lan#0, bb#01-lan#1, and SSCP link is overlapped.
  - Any of the subnets of bb#00-lan#0, bb#01-lan#1, and SSCP link is overlapped.
  - Any of the subnets of bb#01-lan#0, bb#00-lan#1, and SSCP link is overlapped.
- If the subnets of bb#00-lan#0 and bb#00-lan#1 which are in up state on SPARC M10-1/M10-4, it causes an error. Use setnetwork(8) to correct the settings.
- If the total number of characters of the DNS domain name specified with sethostname(8) and the search path specified with setnameserver(8) exceeds 256, it causes an error.
- If the IP address of the SSCP link is not set for all the SPARC M10 Systems cabinet or crossbar boxes, it causes an error. Use setsscp(8) to correct the settings.
- If an IP address that is not included in any XSCF-LAN exists in the gateway address of the routing information, it causes an error. Use setroute(8) to correct the settings.
- If the IP address of the destination of the routing information and the subnet of the SSCP link are overlapped, it causes an error. Use setsscp(8) to correct the settings.

		is configured with multiple XSCFs, do not execute uring an XSCF failover.
EXAMPLES		e XSCF network settings in the SPARC M10-4S with the building figuration (without crossbar box).

NAME	clearremotepwrmgmt - Deletes the management information of the remote power management function.		
SYNOPSIS	<b>clearremotepwrmgmt</b> [-a -G <i>groupid</i> ] [ [-q] - {y n}]		
	clearremotepwr	mgmt -h	
DESCRIPTION	clearremotepwrmgmt is a command to delete the management information of remote power management group on the host node that has been registered as a remote power management group.		
	Before incorporating a host node to the remote power management group or deleting it from the remote power management group, you need to execute this command on the target host node. You do not have to execute clearremotepwrmgmt on the I/O node because the management information is not stored on the I/O node.		
Privileges	To execute this o	command, platadm or fieldeng privilege is required.	
	For details on us	ser privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-a	Deletes all administrative information of remote power management groups which is configured. When the -a and -G options are omitted, it is regarded as the -a option is specified.	
	-G groupid	Specifies the remote power management group to delete the information. In groupid, specify only a single group ID using an integer from 1 to 32. When the -a and -G options are omitted, it is regarded as the -a option is specified.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	function is en setremotep exists, it ends	ecute clearremotepwrmgmt, if the remote power management mabled, it causes an error. It is necessary to set it disabled by using wrmgmt -c disable. When no remote power management group s normally. ecute the command, a prompt to confirm whether to execute it with	
		contents is displayed. To execute, press the [y] key. To cancel, press	

# clearremotepwrmgmt(8)

EXAMPLES	<b>EXAMPLE 1</b> Delete the management information of the remote power management group on the host node.

NAME	console - Connects to the control domain console.		
SYNOPSIS	<b>console</b> $[-q] - \{y n\}$ -p <i>ppar_id</i> $[-f   -r] [-s escapeChar]$		
	console -h		
DESCRIPTION		and to connect from the XSCF shell to the control domain ified physical partition (PPAR).	
	There are two types of control domain consoles, RW console that is available for inputs and outputs and RO console that is available only for reference. To one PPAR, only one RW console can be connected, but more than one RO console can be connected. If one RW console has been already connected, attempting to connect to another RW console causes an error. Even in this case, if the user has platadm privilege or pparadm privilege for the target PPAR, it can be connected to the RW console forcibly. In this case, the RW console that is currently connected will be disconnected.		
	To end the control d key, and then enter	lomain console and return to the XSCF shell, press the [Enter] "#" and "." (period).	
	<b>Note</b> – If you return to the XSCF shell from the domain console, or if you terminate the XSCF shell, both without logging out of the domain, you will be automatically logged out from the domain. At the same time, a termination signal might be sent to any program that is running in the background on the domain console.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng Enables execution for all PPARs.		
	pparadm, pparmgr, pparop Enables execution for PPARs for which you h access privilege.		
For details on user privileges, see setprivileges(8).		privileges, see setprivileges(8).	
OPTIONS	<b>TIONS</b> The following options are supported.		
	C1 0	orcibly connects to an RW console. The RW console that is urrently connected will be disconnected. This can be specified nly by a user who has platadm privilege or pparadm privilege or the target PPAR.	
		Displays the usage. Specifying this option with another option r operand causes an error.	
	-n A	automatically responds to prompt with "n" (no).	

# console(8)

	-p ppar_id	Specifies PPAR-ID of the PPAR to be connected. For <i>ppar_id</i> , only one integer from 0 to 15 can be specified depending on the system configuration.
	-d	Prevents display of messages, including prompt, for standard output.
	-r	Connects to an RO console.
	-s escapeChar	Specifies an escape symbol. The default is "#." As <i>escapeChar</i> , any of the following characters can be specified. Use the double quotation marks (") to enclose the character.
		"#", "@", "^", "&", "?", "*", "=", ".", "   "
		The specified escape symbol is enabled only in the session in which console is executed.
	-у	Automatically responds to prompt with "y" (yes).
		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press
	escape symbol	console, "#" used for the first letter in the line is recognized as an . The escape symbol is specified for having the console perform a sing. The examples of combination available for specifying with "#" pelow.
	"#" + "?"	Outputs the status message.
	"#" + "."(period)	Disconnects the control domain console.
	■ To input "#" fo	or the console at the beginning of the line, press the [#] key twice.
	<ul> <li>To display the</li> </ul>	information about the control domain console that is currently he PPAR, use showconsolepath(8).
EXAMPLES	Example 1 Conn	ect to the RW console of PPAR-ID 0.
	XSCF> console	-p 0
		its may be logged.
	:	$R-ID 0?[y n] : \mathbf{y}$ nain console input/output are displayed.>>

console(8)

NAME	deleteboard - Releases the system board (PSB) from the physical partition (PPAR) configuration.		
SYNOPSIS	deleteboard [ [	-q]-{y n}] [-f] [-c disconnect] psb [ psb]	
	deleteboard [ [	$-q] - {y n} [-f] - c unassign psb [psb]$	
	deleteboard [ [	-q]-{y n}] [-f] -c reserve <i>psb</i> [ <i>psb</i> ]	
	<b>deleteboard</b> -h		
DESCRIPTION	deleteboard is a command to release a PSB from the PPAR configuration, in which the PSB is currently incorporated.		
	deleteboard ca	annot be used on a SPARC M10-1/M10-4.	
	You can specify any of the following releasing methods depending on the conditions after releasing the PSB.		
	disconnect	Releases the PSB from the PPAR configuration and sets it to assigned state. Because the PSB remains being assigned to the PPAR configuration, you can incorporate it into the PPAR again by restarting the PPAR or executing addboard(8).	
	unassign	Releases the PSB completely from the PPAR configuration and sets it to system board pool state. The PSB in system board pool state can be incorporated or assigned to other PPAR configuration.	
	reserve	Does not release the PSB immediately from the PPAR configuration but just reserves it for releasing. After it is reserved, when the specified PPAR is stopped, the PSB is released from the PPAR configuration and set in system board pool state.	
Privileges	To execute this command, any of the following privileges is required.		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	

#### deleteboard(8)

OPTIONS	The following options are supported.	
	-c disconnect	Releases the PSB from the PPAR configuration and sets it to assigned state. If you omit the -c option, -c disconnect is assumed specified.
	-c reserve	Reserves the releasing of PSB. If you omit the -c option, -c disconnect is assumed specified.
	-c unassign	Releases the PSB completely from the PPAR configuration and sets it to system board pool state. If you omit the -c option, -c disconnect is assumed specified.
	-f	Releases the specified PSB forcibly.
		<b>Caution</b> – Releasing a PSB from PPAR forcibly by using the -f option may lead to serious problems on a process to which the CPU bound or on a process that is accessing to the device. For this reason, we recommend that users do not use the -f option during normal operation. If you specify the -f option, be sure to check the conditions of PPAR and business processes.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-d	Prevents display of messages, including prompt, for standard output.
	-У	Automatically responds to prompt with "y" (yes).
OPERANDS	The following operands are supported.	
	psb	Specifies the PSB number of the PSB to be released. You can make multiple specifications by separating them with spaces. The specification format is below.
		$\begin{array}{ll} x-y \\ x \\ y \end{array}$ Specifies an integer from 00 to 15. y It is fixed to 0.
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press

If you specify -c disconnect while the PPAR is stopped or if the PSB has
already been released from the PPAR configuration, no processing is performed.
Also while the PPAR is in starting process or in stopping process, it causes an
error.

If you specify -c unassign even while the PPAR is stopped or the PSB has
already been released from the PPAR configuration, the PSB is switched from the
assigned state to the system board pool state. If the PSB has already been in the
system board pool state, no processing is performed. While the PPAR is in
starting process or in stopping process, it causes an error.

- If you specify -c reserve while the PPAR is stopped or the PSB has already been released from the PPAR configuration, the PSB is switched immediately from the assigned state to the system board pool state. If the PSB has already been in the system board pool state, no processing is performed.
- When a PSB is released, the hardware resources on the PSB are released from the Oracle Solaris. Therefore, it may take time to execute the command.
- The PSB assigned state is the state that the PSB is reserved for incorporating to the specified PPAR. By restarting the PPAR or executing addboard(8), the PSB is incorporated. You cannot incorporate or assign the PSB that has already been assigned to any other PPAR.
- The system board pool is the state that the PSB does not belong to any PPAR. Because the PSB in system board pool state does not belong to any PPAR, you can assign or incorporate it freely as long as it is defined in PCL.
- Even if the PPAR is not running, you can execute this command. However, to execute this command with specifying -c configure while the PPAR is running, the Logical Domains (LDoms) Manager needs to be running.
- **EXAMPLES EXAMPLE 1** Set the PSBs 00-0, 01-0, 02-0, and 03-0 in system board pool.

XSCF> deleteboard -c unassign 00-0 01-0 02-0 03-0

**EXAMPLE 2** Reserve the PSBs 00-0, 01-0, 02-0, and 03-0 for releasing.

```
XSCF> deleteboard -c reserve 00-0 01-0 02-0 03-0
```

- **EXIT STATUS** The following exit values are returned.
  - 0 Indicates normal end.
  - >0 Indicates error occurrence.

deleteboard(8)

NAME	deletecodactivation - Deletes the CPU core Activation key of the CoD from the CoD database.		
SYNOPSIS	<b>deletecodactivation</b> [-f] [ [-q] - {y n}] - i key-index		
	deletecodactiv	ration -h	
DESCRIPTION	deletecodactivation is a command to delete the specified CPU core Activation key from the CoD database on the service processor.		
		tails on the CPU core Activation key, see the SPARC M10 Systems on and Administration Guide.	
	The system checks the number of CPU core Activations and the number of CoD resources in use. If deleting a CPU core Activation results in the number of CPU core Activations being lower than the assigned number of CoD resources, the CPU core Activation key is not deleted from the CoD database. To delete the CPU core Activation key in this case, you need to reduce the assigned number of CoD resources. Use setcod(8) to change the assigned number of CPU core Activations.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-f	Deletes the specified CPU core Activation key forcibly from the CoD database.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i key-index	Specifies the administration number of the CPU core Activation key to be deleted from the CoD database. Use showcodactivation(8) to check the administration number.	
	-n	Automatically responds to prompt with "n" (no).	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press the	

EXAMPLES	<b>EXAMPLE 1</b> Delete the CPU core Activation key with the administration number 10.	
	<pre>XSCF&gt; deletecodactivation -i 10 Product: SPARC M10-1 SequenceNumber: 116 Cpu noExpiration 2 Text-Signature-SHA256-RSA2048: SBxYBSmB32E1ctOidgWV09nGFnWKNtCJ5N3WSlowbRUYlVVySvjncfOrDNteFLzo Above Key will be deleted, Continue?[y n]:y</pre>	
EXIT STATUS	The following exit values are returned.	
	0 Indicates normal end.

L

NAME	deletefru - Removes the Field Replaceable Unit (FRU) or a cabinet.		
SYNOPSIS	deletefru		
	deletefru -h		
DESCRIPTION	deletefru is a command to remove FRU or a cabinet.		
	This command enables settings required for removals, such as selecting, confirming, or removing FRU or a cabinet, interactively by using menu format.		
	The following FRU or cabinet can be removed by deletefru.		
	<ul> <li>Power supply unit (PSU)</li> </ul>		
	■ SPARC M10-4S		
Privileges	To execute this command, the fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	deletefru can only be executed on the master XSCF. Attempting to execute it on a standby XSCF causes an error.		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	addfru (8), deleteboard (8), replacefru (8), showhardconf (8), showpparstatus (8), unlockmaintenance (8)		

deletefru(8)

NAME	deletepowerschedule - Deletes a schedule for powering on/off the automatic power control system (APCS).		
SYNOPSIS	<b>deletepowerschedule</b> [ $[-q] - \{y n\}$ ] $\{-r id   -p ppar_id   -a\}$		
	deletepowersche	edule -h	
DESCRIPTION	deletepowerschedule is a command to delete a schedule for powering on/off the APCS.		
Privileges	To execute this co	ommand, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Deletes all the schedule data.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID for deleting a schedule. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> . All the schedules which are set to the specified PPAR-ID are deleted.	
	- d	Prevents display of messages, including prompt, for standard output.	
	-r id	Specifies the schedule data to be deleted. You can check <i>id</i> by using showpowerschedule(8).	
	-у	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION			
		n-existent <i>ppar_id</i> or <i>id</i> , or invalid option causes an error.	
		data which has been set by using addpowerschedule -a to cover not be deleted by deletepowerschedule -p <i>ppar_id</i> .	

	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.
EXAMPLES	<b>EXAMPLE 1</b> Delete all the schedules set to PPAR-ID 1.
	XSCF> deletepowerschedule -p 1 PPAR-ID 1 Power schedule will be deleted, Continue?[y n]: $y$ XSCF>
	<b>EXAMPLE 2</b> Delete the schedule set to the schedule ID 3.
	XSCF> <b>deletepowerschedule -r 3</b> ID 3 Power schedule will be deleted, Continue?[y n]: <b>y</b> XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	addpowerschedule(8), setpowerschedule(8), showpowerschedule(8)

NAME	deleteuser - Deletes an XSCF user account.		
SYNOPSIS	deleteuser user		
	deleteuser -h		
DESCRIPTION	deleteuser is a command to delete an XSCF user account.		
	Executing deleteuser deletes the user account and all the data associated with the user account, such as a password and a public key for Secure Shell (SSH).		
	When you delete a user account, the XSCF shell and the XSCF Web session which are being executed on the deleted user account end at the same time. Because the user account is deleted from the system, you cannot use the user account for login. You cannot delete the user account that is currently used for login.		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
OPERANDS	The following operands are supported.		
	<i>user</i> Specifies the XSCF user account to be deleted.		
EXAMPLES	<b>EXAMPLE 1</b> Delete an XSCF user account.		
	XSCF> deleteuser jsmith		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	adduser(8), disableuser(8), enableuser(8), showuser(8)		

deleteuser(8)

NAME	diagxbu - Diagnose c	rossbar cable and crossbar unit (XBU).	
SYNOPSIS	<b>diagxbu</b> [ [-q] - {y n}] -b bb_id -t target_bb [-t target_bb]		
	<b>diagxbu</b> [ [-q] - {y n}] -b bb_id -p ppar_id		
	diagxbu -h		
DESCRIPTION	diagxbu is a command to diagnose a crossbar cable and crossbar unit that is connected to the specified SPARC M10-4S.		
	crossbar cable. To exe	nounted on SPARC M10-4S or a crossbar box, connected with a cute diagxbu, specifying SPARC M10-4S to be diagnosed, and communicated are required.	
	SPARC M10-4 to be diagnosed can be specified with -b <i>bb_id</i> . To start the diagnosis, the system board (PSB) on SPARC M10-4S must be in system board pool, or powered off.		
	Either SPARC M10-4S should be specified, according to the status of PSB on SPARC M10-4S, as the communication target.		
	<ul> <li>When a PSB is in the system board pool, or its power is off, specify SPARC M10- 4S by -t target_bb.</li> </ul>		
	<ul> <li>When a PSB is running on a physical partition (PPAR), specify PPAR by -p ppar_id.</li> </ul>		
	This command is not	supported on SPARC M10-1 and SPARC M10-4.	
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user p	vivileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-ъ bb_id	Specifies BB-ID of a SPARC M10-4S to diagnose. For <i>bb_id</i> , integer 0-3 can be specified on SPARC M10-4S (without a crossbar box), and 0-15 can be specified on SPARC M10-4S (with a crossbar box).	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the PPAR on which the destination SPARC M10-4S is running. <i>ppar_id</i> can be specified with an integer 0-15 depending on the system configuration.	

# diagxbu(8)

	-d	Prevents display of messages, including prompt, for standard output.	
	-t target_bb	Specifies BB-ID of the target SPARC M10-4S. For <i>bb_id</i> , integer 0-3 can be specified on SPARC M10-4S (without a crossbar box), and 0-15 can be specified on SPARC M10-4S (with a crossbar box).	
	- Y	Automatically responds to prompt with "y" (yes).	
5		e the command, a prompt to confirm whether to execute it with ents is displayed. To execute, press the [y] key. To cancel, press	
		hen a PSB on SPARC M10-4S specified with -b <i>bb_id</i> or -t of the following statuses.	
	<ul> <li>Being included</li> </ul>	in a PPAR and this PPAR is running.	
	0	in a PPAR and this PPAR is at OpenBoot PROM of the booting	
	<ul> <li>Being included in a PPAR and this PPAR is being powered on, powered off, or in the resetting process.</li> </ul>		
	<ul> <li>addboard(8) and</li> </ul>	nd deleteboard(8) are in execution for PSB.	
	<ul> <li>An error occurs when a PPAR specified with -p <i>ppar_id</i> is in one of the for states.</li> </ul>

diagxbu(8)

NAME	disableuser - Disables an XSCF user account.
SYNOPSIS	disableuser user
	disableuser -h
DESCRIPTION	disableuser is a command to disable an XSCF user account.
	This does not affect the session that you currently log in. The disabled user account cannot be used for the next and later login. This setting is applied not only to the Secure Shell (SSH) but also to the console connected in serial or in Telnet connection. A login to XSCF Web is also disabled.
	All the data associated to the disabled user account such as a password or SSH key are stored in XSCF. Using enableuser(8) enables the disabled user again.
Privileges	To execute this command, useradm privilege is required.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
OPERANDS	The following operands are supported.
	<i>user</i> Specifies the XSCF user account to be disabled.
EXAMPLES	<b>EXAMPLE 1</b> Disable an XSCF user account.
	XSCF> disableuser jsmith
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	dumpcodactivat	ion - Saves the CPU core Activation key in a file.
SYNOPSIS	dumpcodactivat proxy [-t proxy_	ion [-v][-V][[-q]-{y n}][-e [-P password]][-u user][-p type]] url
	dumpcodactivat	ion -h
DESCRIPTION	dumpcodactiva set for XSCF, to	ation is a command to save the CPU core Activation key, which is the file.
		ctivation key which is saved to the file can be restored to XSCF, by precodactivation(8).
Privileges	To execute this c	command, any of the following privileges is required.
	platadm, plato	op,fieldeng
	For details on us	ser privileges, see setprivileges(8).
OPTIONS	The following o	ptions are supported.
	-e	Encrypts a file. You can specify a password using -P <i>password</i> . If you omit -P <i>password</i> , it displays a prompt for password entry. When you encrypt and save the CPU core Activation key, you need a password for restoring it. If you lose the password, the CPU core Activation key cannot be restored.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-P password	Sets a password for encryption. Specify it with the -e option. If you omit the -P option, a prompt for setting a password appears. You can specify this using up to 128 characters.
	-p proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type,</i> the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.
	-đ	Prevents display of messages, including prompt, for standard output.
	-t proxy_type	Specifies the proxy type. Specify it with the -p option. You can specify any of http, socks4, and socks5. The default is http.
	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.

### dumpcodactivation(8)

	- V	Displays detailed information. This option is used to diagnose server problems.

l

NAME	dumpconfig - Saves the XSCF configuration information in a file.
SYNOPSIS	<b>dumpconfig</b> [-v] [-V] [[-q] -{y n}][-e [-P password]][-c comment][-u user] [-p proxy [-t proxy_type]] url
	dumpconfig -h
DESCRIPTION	dumpconfig is a command to save the XSCF configuration information in the specified file.
	Using restoreconfig(8) enables restoration of the saved configuration information to XSCF.
Privileges	To execute this command, any of the following privileges is required.
	platadm, platop, fieldeng
	For details on user privileges, see setprivileges(8).

OPTIONS	The following op	otions are supported.
	-c comment	Sets a comment in the file. If there are several piece of the saved XSCF configuration information, this can be used for categorizing the files. The comment will not be loaded into the XSCF at restoration.
		Specify <i>comment</i> using up to 132 characters. You can use alphanumeric characters, double quotation marks ("), and spaces. Alphabets are case-sensitive. To use spaces, enclose the entire comment in double quotation marks. No special characters are available.
		An example of a comment is shown below. -c "This is a valid comment"
		Because spaces are used in the comment without enclosed in double quotation marks, the following example is incorrect. -c This is an invalid comment
		Because it includes unavailable special characters, the following example is incorrect. -c "This! is @invalid"
	-e	Encrypts a file. You can specify a password using -P <i>password</i> . If you omit - P <i>password</i> , it displays a prompt for password entry. When you encrypt and save the XSCF configuration information, you need a password for restoring it. If you lose the password, the XSCF configuration information cannot be restored.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-₽ password	Sets a password for encryption. Specify it with the -e option. If you omit the -P option, a prompt for setting a password appears. You can specify this using up to 128 characters.
	-p proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.
	-d	Prevents display of messages, including prompt, for standard output.
	-t proxy_type	Specifies the proxy type. Specify it with the -p option. You can specify any of http, socks4, and socks5. The default is http.

	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.
	- V	Displays detailed information. This option is used to diagnose server problems.
	- V	Displays detailed network activities. This option is used to diagnose network and server problems.
	-у	Automatically responds to prompt with "y" (yes).
OPERANDS	The following op	erands are supported

NAME	enableuser - Enables an XSCF user account.
SYNOPSIS	enableuser user
	enableuser -h
DESCRIPTION	enableuser is a command to enable the disabled XSCF user account.
	The enabled user account becomes available for login to the console by using Secure Shell (SSH). Using enableuser enables the account that is disabled by using disableuser(8).
Privileges	To execute this command, useradm privilege is required.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
OPERANDS	The following operands are supported.
	<i>user</i> Specifies the XSCF user account to be enabled.
EXAMPLES	<b>EXAMPLE 1</b> Enable a user account.
	XSCF> enableuser jsmith
EXIT STATUS	The following exit values are returned.

NAME	flashupdate - Up	odates the firmware.
SYNOPSIS	flashupdate -c	check -m {xcp  xscf} -s version
	flashupdate [[-	q]-{ $y n$ }]-cupdate-m {xcp  xscf} [-f]-s version
	flashupdate -c :	sync
	flashupdate -h	
DESCRIPTION	flashupdate is	a command to update the firmware.
		updates the following firmware. By specifying -c check, you can pility of update in advance.
		entire XSCF Control Package (XCP) (XSCF firmware, Hypervisor enBoot PROM firmware, and Power-On Self-Test (POST) firmware)
	<ul> <li>Updating XSC</li> </ul>	CF firmware only
Privileges	To execute this c	ommand, platadm or fieldeng privilege is required.
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following op	ptions are supported.
	-c check	Checks whether or not the specified firmware can be updated.
	-c update	Updates the specified firmware. When the system is in the multi-XSCF configuration, all XSCFs are updated at the same time.
	-c sync	When the system is in multi-XSCF configuration, this option matches the version of each XSCF firmware. It is used when the FRU including XSCF is replaced.
	-f	To update the firmware to the specified version, it is overwritten even if the same version has already been written.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-m xcp	Targets the entire XCP. Specify this option to check, register, and update the firmware.
	-mxscf	Targets the XSCF firmware. Specify this option to check or update the firmware.
	-n	Automatically responds to prompt with "n" (no).

	-d	Prevents display of messages, including prompt, for standard output.
	-s version	Specifies the firmware version for checking, registering, or updating the firmware. <i>version</i> specifies the major version and minor version in decimal. This can be specified using the following format.
		ххуу
		xxMajor versionyyMinor version
	-У	Automatically responds to prompt with "y" (yes).
EXTENDED DESCRIPTION	the specified c the [n] key.	cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press XSCF firmware is updated, the XSCF is reset. Therefore, while the
		N connection, it is once disconnected.
	2	faulty Field Replaceable Unit (FRU), the firmware cannot be ect the fault of FRU before updating it.

flashupdate(8)

NAME	getflashimage - l	Downloads an XSCF Control Package (XCP) image file.
SYNOPSIS	getflashimage [·	-v] [ [-q] -{y n}] [-u user] [-p proxy [-t proxy_type]] url
	getflashimage -	1
	getflashimage [	[-q]-{y n}][-d]
	getflashimage -	h
DESCRIPTION	getflashimage flashupdate(8	e is a command to download an XCP image file used for ).
	before the new w	er version of XCP image file on the service processor, it is deleted version image file is downloaded. After the image file is cessfully, the correctness of the file is verified, and the MD5 is displayed.
Privileges	To execute this c	command, platadm or fieldeng privilege is required.
	For details on us	ser privileges, see setprivileges(8).
OPTIONS	The following op	ptions are supported
	-d	Deletes all the older versions of the XCP image file on the service processor.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-1	Displays the list of the XCP image files on the service processor.
	-n	Automatically responds to prompt with "n" (no).
	-p proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http.Specify <i>proxy</i> in <i>servername:port</i> format.
	-đ	Prevents display of messages, including prompt, for standard output.
	-t proxy_type	Specifies the proxy type. Specify it with the -p option. You can specify any of http, socks4, and socks5. The default is http.
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry.
	-v	Displays detailed information. This option is used to diagnose network and server problems.
	-у	Automatically responds to prompt with "y" (yes).
	l	

<pre>url Specify URL for downloading the firmware image. The following types of format are supported. http://server[:port]/path/file https://server[:port]/path/file ftp://server[:port]/path/file file:///media/usb_msd/path/file file is replaced with any of the following values. XCPvvvv.tar.gz PCIBOXvvvv.tar.gz</pre>
<pre>https://server[:port]/path/file ftp://server[:port]/path/file file:///media/usb_msd/path/file file is replaced with any of the following values. XCPvvvv.tar.gz</pre>
XCP <i>vvvv</i> .tar.gz
_
Also, <i>vvvv</i> is replaced with the version number consisting of four characters.
<b>Extended</b> <b>description</b> When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.
<b>EXAMPLES EXAMPLE 1</b> Download an image file from the HTTP server.

NAME	getremotepwrmgmt - Obtains the settings information of the remote power management function.		
SYNOPSIS	<b>getremotepwrmgmt</b> {-G groupid} [-v] [-u user] [-X proxy [-t proxy_type]] [ -y -n] configuration_file		
	getremotepwrmgmt -h		
DESCRIPTION	getremotepwrmgmt is a command to obtain the settings information of remote power management group and to save it as a management information file in CSV format.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-G groupid	Specifies one group ID of the remote power management group. You can specify a value from 1 to 32.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-t proxy_type	Specifies the proxy type.	
		Specify it with the -X option. You can specify any of http, socks4, and socks5. The default is http.	
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry.	
	-v	Displays detailed information.	
		This option is used to diagnose network and server problems.	
	-X proxy	Specifies the proxy server to use for obtaining information. If you omit -t <i>proxy_type</i> , the default proxy type is http.Specify <i>proxy</i> in <i>servername:port</i> format.	
	-у	Automatically responds to prompt with "y" (yes).	

OPERANDS	The following operands are supported.		
	configuration_file	Specifies URL to be the destination of saving the management information file.	
		The following types of format are supported.	
		<pre>http://server[:port]/path/file https://server[:port]/path/file ftp://server[:port]/path/file file:///media/usb_msd/path/file</pre>	
EXTENDED DESCRIPTION	■ If non-existing group ID is specified for the -G option, an error occurs.		
	• You can use the management information file of the remote power management group obtained with getremotepwrmgmt as it is for when you execute setremotepwrmgmt -c config.		
	• Set the format of the management information file to CSV. For details on the format of the management information file, see the <i>SPARC M10 Systems System Operation and Administration Guide</i> .		
	<ul> <li>It is necessary to create the management information file for each grou management information file has multiple group IDs, it causes an error</li> </ul>		
	in the manager	I to access the distribution destination of the information is not set ment information file and the default user is not specified, it is there the password when distributing the information of the remote ement group.	
	<ul> <li>Use the following procedure for updating the settings of the existing remote power management group.</li> </ul>		
		emotepwrmgmt to obtain the settings information of the remote ement group to be updated as management information file.	
	2. Edit the file obtained in Step 1.		
	3. Execute setremotepwrmgmt -c disable to disable the remote power management function of the remote power management group to be updated.		
	<ol> <li>Specify the management information file that was edited in Step 2, and execute setremotepwrmgmt -c config to update the settings of the remote power management group.</li> </ol>		
		motepwrmgmt -c enable to enable the remote power unction of the updated remote power management group.

SYNOPSIS	initbb[[-q]-{y n}][-f]-b bb_id		
	initbb -h		
DESCRIPTION	initbb detaches the SPARC M10-4S and the crossbar box from the system configuration and initializes it to the factory default.		
	After you executed the initbb, the SPARC M10-4S and the crossbar box will be halted.		
	initbb cannot b	be used on a SPARC M10-1/M10-4.	
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-b bb_id	Specifies the SPARC M10-4S or the crossbar box to initialize. In <i>bb_id</i> , you can specify an integer from 0 to 15 in case of SPARC M10-4S, and from 80 to 83 in case of crossbar box.	
	-f	Forcibly detach the SPARC M10-4S or the crossbar box even though a system is abnormal condition.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	<ul> <li>Execute the initbb in the master XSCF. Whether it is the master XSCF or not can be confirmed by using the showbbstatus(8).</li> </ul>		
	■ The initbb c	annot initialize the master XSCF.	
	<ul> <li>After you executed the initbb, the SPARC M10-4S and the crossbar box will be detached from the system and be halted. To build it into the system again, power off and on the system or add on the target SPARC M10-4S and the crossbar box.</li> </ul>		
	<ul> <li>By making the serial connection to XSCF on target SPARC M10-4S or the crossbar box, the status and the completion of initialization can be confirmed.</li> </ul>		
	<ul> <li>To initialize th off.</li> </ul>	e crossbar box, execute the command while the system power is	
	I		

• To initialize the crossbar box, execute the command after the system turned off. If the system is not turned off, it results in an error.

System turn-off condition means that all PPAR are turned off. If those are up and running, execution of poweroff -a will turn off all PPAR, and then system power will be disconnected. Execute the showhardconf(8) command and see the display of "System\_Power:" ("On" or "Off"), to confirm the condition of system power.

- To initialize the SPARC M10-4S, execute the command while the system board on the SPARC M10-4S is in the system board pooling status, or while it is detached from the PPAR configuration. If the system board is not in the system board pooling status, it turns to the system board pooling status. If the system board is built into the PPAR configuration and the PPAR is in operation, it results in an error.
- To initialize the SPARC M10-4S, the PPAR which has the same ID as the target SPARC M10-4S needs to be powered off.
- After initialized the SPARC M10-4S, the PPAR which has the same ID as the target SPARC M10-4S becomes unable to power on. This can be resolved by either of the following methods.
  - Add on the initialized SPARC M10-4S and build it into the system again
  - Change the PPAR configuration to use another PPAR-ID
- When the serial number of the target SPARC M10-4S or the crossbar box has been used as the serial number of the system, it results in an error.
- If "n" is entered for the prompt at the command execution, it ends without initializing the SPARC M10-4S.
- When you specified the -f option, the SPARC M10-4S or the crossbar box is detached from the system configuration even though it is in the abnormal status. However, if the target SPARC M10-4S or the crossbar box is not normal, there is no guarantee that it will be initialized properly.
- After the command was executed, a CPU core Activation key, which had been registered to the system is deleted. To retain a CPU core Activation key, you must save this CPU core Activation key by executing the dumpcodactivation(8) beforehand. Be sure to execute initbb before executing the restorecodactivation(8) for the restoration of the saved CPU core Activation key.

In a case where initbb was executed before saving the CPU core Activation key, you must register a CPU core Activation key again.

 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.

**EXAMPLES EXAMPLE 1** Initializes BB#01 to the factory default. After executed the command, BB#01

	stops.		
	<pre>XSCF&gt; initbb -b 1 You are about to initialize BB/XB-Box. NOTE the following. 1. BB/XB-Box is excluded from the system and halted. 2. PPAR-ID of the same value as BB-ID becomes invalid. Continue? [y n] :y</pre>		
	<b>EXAMPLE 2</b> Initialize XBBOX#81. The prompt is automatically given a "y" response. After executed the command, XBBOX#81 stops.		
	<pre>XSCF&gt; initbb -y -b 81 You are about to initialize BB/XB-Box. NOTE the following. 1. BB/XB-Box is excluded from the system and halted. 2. PPAR-ID of the same value as BB-ID becomes invalid.</pre>		
	Continue? [y n] :y		
	<b>EXAMPLE 3</b> Initializes BB#01. The prompt is hidden and automatically given a "y" response.		
	XSCF> initbb -q -y -b 1		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	showbbstatus (8)		

initbb(8)

NAME	ioxadm - Manages the cards connected to the PCI Expansion unit, link card, and host server.		
SYNOPSIS	ioxadm [-f] [-A] [-v] [-M] env [-e] [-l] [-t] [ target [ sensor]]		
	ioxadm [-f] [-A] [-V] [-M] list [ <i>target</i> ]		
	ioxadm [-f] [-A] [-V] [-M] locator [on off] [ target]		
	ioxadm [-f] [-A] [-v] [-M] poweroff target		
	ioxadm [-f] [-A] [-V] [-M] poweron target		
	ioxadm [-f] [-A] [-V] [-M] reset target		
	<pre>ioxadm [-f] [-A] [-v] [-M] setled [on off blink] target led_type</pre>		
	<pre>ioxadm serial target serial_num</pre>		
	ioxadm -c check target -s version		
	ioxadm [-f] [-A] [-v] [-M]-cupdate target -s version		
	ioxadm -h		
DESCRIPTION	ioxadm is a command to manage the cards connected to the PCI Expansion unit, link card, and host server.		
	To use ioxadm, it is necessary to specify the operand and the option required for the operand. What can be specified for the target device is a card mounted in the PCI slot built in the host server, PCI Expansion unit, or Field Replaceable Unit (FRU) in the PCI Expansion unit. The cards in the host server are identified by character strings indicating the paths from the host server to the cards.		
	For details, see the section of <i>target</i> of the option.		

# ioxadm(8)

Privileges	To execute this command, any of the following privileges is required.		
	Privileges	Operands	
	platop	env,list	
	platadm	env, list, locator, poweroff, poweron	
	fieldeng	All operands	
	For details on v	user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-A	Hides the headers of outputs and displays only the analyzable outputs. Each field is separated with a single tab.	
	-c check	Checks whether the firmware can be applied. Checks the firmware of the type/version specified by the operand.	
	-c update	Updates the firmware of the PCI Expansion unit and link card. Updates the firmware of the version and <i>target</i> specified by the operand.	
	-f	Executes the command forcibly ignoring the warning.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	– M	Displays text one screen at a time.	

-s version	Specifies the version of the firmware. Specifies when checking, registering, or updating the firmware. Specifies the major versior and minor version in <i>version</i> continuously.		
	The version of firmware is specified by four figures such as " <i>xxyy</i> ." The numbers have the following meanings.		
	xxMajor release numberyyMinor release number		
-v	Displays detailed information. For details, see each operand.		
target	Specifies the target device. You can specify any of the cards mounted in the PCI slot built in the host server, PCI Expansion unit or the FRU in the PCI Expansion unit.		
	The cards mounted in the slots of the host server are identified by <i>host_path</i> .		
	<i>host_path</i> depends on the platform and indicates the path to the slot of the host server in which the card is mounted. <i>host_path</i> is indicated in the following format.		
	BB#0-PCI#0, PCI-E slot0		
	PCI Expansion unit ( <i>box_id</i> ) is identified by the serial number.		
	To refer to the serial number, use "PCIBOX# <i>nnnn</i> ." " <i>nnnn</i> " is the last four digits of the serial number of PCI Expansion unit.		
	Depending on the specified contents, only one of the components of PCI Expansion unit may be affected. For example, the IO Board and power supply unit can be turned on and off independently.		
	The FRU ( <i>fru</i> ) in PCI Expansion unit is identified as follows.		
	PCIBOX#nnnn/IOB – IO Board		
	PCIBOX# <i>nnnn</i> /FANBP – Fan backplane		
	PCIBOX# <i>nnnn</i> /PSU#0 – Power supply unit in the rear lower bay		
	PCIBOX# <i>nnnn</i> /PSU#1 – Power supply unit in the rear upper bay		
	PCIBOX# $nnnn/FAN#0 - Fan$ unit in the front left bay		
	PCIBOX# <i>nnnn</i> /FAN#1 – Fan unit in the front central bay		
	PCIBOX# <i>nnnn</i> /FAN#2 – Fan unit in the front right bay		

# ioxadm(8)

OPERANDS	The following operands are supported.		
	env [-e] [-l] [-t] [target [sensor]]		
	Displays the su or link card.	Displays the summary of the environment status of the PCI Expansion unit	
	-e	Displays the status regarding electricity (measurement values of the current and voltage, rotation speed of the fan, and settings of the switches).	
	-1	Displays the status of LED.	
	-t	Displays the measurement value of the temperature sensor.	
	target	See the section of <i>target</i> of the option. For the contents unique to the env operand, see the following.	
	sensors	Specifies the sensor whose data is to be displayed. If not specified, the information on all sensors is displayed. It is specified with <i>target</i> .	
	If the FRU in the PCI Expansion unit or card in the slot of the host specified as <i>target</i> , env just displays the environment information of FRU. If none of the options, -e, -l or -t is specified, the information on a are displayed. If no sensor is specified, the information on all sensor displayed. If <i>target</i> is not specified, the information on all PCI Expanding units is displayed.		
If <i>box_id</i> is specified as <i>target</i> , env displays the list of the sensor m values for all FRUs and link cards mounted in the specified PCI unit.			
	The options of	env can be used in any combinations.	

The following information is also applied to env and the displayed result.

- The result is displayed in a table format. Each FRU sensor is displayed in the first column. What is entered in the second column is the sensor name. It is displayed as T\_AMBIENT in the case of the ambient temperature and V\_12V\_0V in the case of the measurement value of the voltage of the 12V rail. The third, fourth, and fifth columns shows the sensor measurement value (Value), sensor resolution (Res), and unit(Units), respectively. See Example 1.
- Each FRU has various sensors. To specify multiple values in *sensor*, specify them separating the values with spaces. The values which can be specified in *sensor* are shown in the Sensor column of Example 1. Units displays the degrees C, voltage, ampere, SWITCH, and RPM.
- The name of *sensor* depends on FRU and varies according to the type of FRU. It may vary among each FRU in some cases.
- If the -v option is specified, the detailed information is output. In addition to the normal output, the maximum value and minimum value (Max, Min) supported by the sensor as well as the upper and lower warning thresholds (Min Alarm, Max Alarm) are included in the outputs.
- The LED indicator does not support these fields.
- The filed including "-" indicates that the setting is not supported. For example, there is no warning threshold regarding the lower limit of the temperature.

### led\_type

Specifies the FRU LED which can be controlled by XSCF. It is specified with the setled operand. The following table shows the statuses of the LEDs which can be controlled by the values of the setled operand: off, on, and blink. Y (yes) shows the controllable LEDs. N (no) shows the uncontrollable LEDs.

LEDNameoffonblinkLOCATELocateYNY

\* All LED statuses can be set for the OVERTEMP LED and the ACTIVE LED of the cabinet. However, the LED status after change may not be displayed because the status of the LED is frequently updated by hardware.

**Note** – Other LEDs are not controlled by software. The list of the LEDs included in the system can be displayed by using the env -1 operand.

### list [target]

Displays the list of the PCI Expansion unit managed by the system.

If list is executed without specifying *target*, the list of the PCI Expansion unit is displayed. (One PCI Expansion unit is displayed in each line.) Each line includes the identifier unique to PCI Expansion unit and the name unique to the host of the link card. See Example 3.

If the command is executed by specifying the argument of PCI Expansion unit or the path of the link card, a single line including the specified FRU is displayed. If *host path* is specified, only the information of the link card is displayed. If the detailed option [-v] is set, the detailed information of FRU is included in the output. See Example 4 and 5.

```
locator [on | off] [target]
```

Sets or inquires the status of the chassis (locator) LED.

If locator is executed without specifying an option, the current status of the LED regarding the specified FRU is output.

To use the field of the option, the *target* argument is essential. The only *target* which can be specified is the PCI Expansion unit.

on	Illuminates the LED.
off	Turns off the LED.

The chassis locator is the orange LED. If FRU is specified, the yellow service LED of FRU is used with the chassis (locator) LED.

There is only one FRU which activates the location indicators simultaneously in the chassis of PCI Expansion unit. If the chassis (locator) LED is turned off, the (service) FRU LED stops blinking. See Example 6.

#### poweroff target

Indicates that the specified FRU was shut down, the corresponding LED was turned on, and the FRU has become removable. If *target* is PSU, use it with the -f.

**Note** – Do not remove both of the two power supply units (PSU) of the same PCI Expansion unit. If the two power supply units are shut down, the power of PCI Expansion unit cannot be turned on again from the command line. The power of PCI Expansion unit needs to be turned on only from the chassis.

**Note** – The LED and fan may operate even if one of the power supply units is shut down, because they are powered from two power supply units.

#### poweron *target*

Recovers all power supply to the IO Boards. Or reactivates the power supply from a removable power source. If a new power supply unit is installed and the POWER switch is turned on, or the IO board is connected to a link card with a power source, the power supplies are automatically turned on. However, as for the power supply units or IO Boards whose power has already been turned off for removal, this command can be used to turn on the power again only if the position of the POWER switch is ON.

```
reset target
```

Reinitializes the FRU components used for monitoring of the PCI Expansion unit environment. If the IO Board or link card is specified, the bridge controller of the link card is reset and reinitialized. If PCI Expansion unit is specified, the fan controller and demultiplexer of PCI Expansion unit as well as the bridge controller associated with PCI Expansion unit are reset and reinitialized.

setled [on | off | blink] target led\_type

Sets the LED status.

off	Turns off the LED.
on	Illuminates the LED.
blink	Makes the LED blink.

For details on the LED types, see *led\_type*.

The only *target* which can be specified is the PCI Expansion unit.

serial target serial\_num

Specifies a serial number of the PCI Expansion unit. This operand is used to re-register the serial number of the PCI Expansion unit when replacing the IO board and Fan backplain at a time.

The only *target* which can be specified is the PCI Expansion unit.

**EXAMPLES EXAMPLE 1** Display the measurement values of the temperature, voltage, current, and fan rotation speed sensors.

```
XSCF> ioxadm env -te PCIBOX#A3B5

                  Sensor Value Resolution Units
                                              LED
```

The white LED of the chassis of PCI Expansion unit has a POWER button. This button can be used to switch the status of the white locator LED of the chassis to

	<ul><li>"Off" or "High-speed." If the locator LED is turned off using this button, the FRU service LED of high-speed blinking is cleared.</li><li>The following exit values are returned.</li></ul>	
EXIT STATUS		
	0	Indicates normal end.
	>0	Indicates error occurrence.

ioxadm(8)

NAME	nslookup - Refers to the Internet name server for the host name.		
SYNOPSIS	nslookup hostname		
	nslookup -h		
DESCRIPTION	nslookup is a co name.	ommand to refer to the Internet name server for the specified host	
	The following ini	formation is displayed.	
	Server	Name of the Internet name server	
	Address	IP address of the Internet name server	
	Name	Host name	
	Address	IP address of the host	
Privileges	No privileges are required to execute this command.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
OPERANDS	The following operands are supported.		
	hostname	Specifies the host name set in the network interface. You can specify it by the Fully Qualified Domain Name (FQDN) or an abbreviation.	
EXTENDED DESCRIPTION	Executing nslookup with nothing specified causes an error.		
EXAMPLES	<b>EXAMPLE 1</b> Display the information of the host name scf0-hostname0.		
	XSCF> <b>nslookup scf0-hostname0</b> Server: server.example.com Address: 192.168.1.100		
	Name: scf0-hostname0.example.com Address: 192.168.1.101		

# nslookup(8)

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	

l

NAME	password - Sets	the password of the XSCF user account and the effective period.	
SYNOPSIS	<pre>password [-e days   date   NEVER] [-i inactive] [-M maxdays] [-n mindays] [-w warn] [ user]</pre>		
	password -h		
DESCRIPTION	password is a construction of the second sec	ommand to set the password of the XSCF user account and the of the password.	
	The password is used.	specified within 32 characters. The following characters can be	
	<ul> <li>abcdefghijklm</li> </ul>	nopqrstuvwxyz	
	-	KLMNOPQRSTUVWXYZ	
	<ul> <li>0123456789</li> <li>0123456789</li> </ul>		
		()+='~,> ''?;:[SPACE]</th	
		executed with one or more options specified, the effective period of anged. For the default value, see setpasswordpolicy(8).	
	If password is e displayed.	xecuted with option omitted, the prompt to change the password is	
	If password is e becomes the targ	executed with the <i>user</i> operand omitted, the current user account get.	
		t must be local no matter whether the user name is specified. If the not local, the password will cause an error.	
Privileges	To execute this c	ommand, the following privileges are required.	
	useradm	The user can configure a password and effective period of any user account unconditionally.	
	the other privileges	The user can configure only its own password.	
	For details on us	er privileges, see setprivileges(8).	

# password(8)

OPTIONS	The following option	s are supported.
	-e days date Never	Sets the number of days of the effective period of the XSCF user account beginning today in <i>days</i> . 0 to 10730 can be specified.If the result of adding the value specified in <i>days</i> to the current date exceeds January 2038, the specified value becomes invalid and the command is not executed.
		Sets the expiration date of the account in <i>date</i> . Specifies a date before January 2038. This can be specified using one of the following format.
		<i>mm/dd/yy</i> (10/30/12) <i>yyyy-mm-dd</i> (2012-10-30) <i>yy-mm-dd</i> (12-10-30) <i>dd-Mmm-yy</i> (30-Oct-12) <i>dd-Mmm-yyyy</i> (30-Oct-2012) <i>dd Mmm yy</i> ("30 Oct 12") <i>Mmm dd, yy</i> ("Oct 30, 12") <i>Mmm dd, yyyy</i> ("Oct 30, 2012")
		If a format including a space is used, put it in double quotation marks ("). This is not case-sensitive.
		Never indicates that the account has already expired. This is not case-sensitive.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-i inactive	Sets the number of days from the expiration of the password to account lock. This value is assigned when a new user account is created. The default is -1. If the value is -1, it indicates that the account is not locked even after the expiration of the password. This is specified with an integer from -1 to 999999999.

	-M maxdays	Sets the maximum number of days when the password is effective. This value is assigned when a new user account is created. The default is 999999. This is specified with an integer from 0 to 999999999.		
	-n <i>mindays</i>	Sets the minimum number of days from a change in the password to the next change. The default is 0. This indicates that the password can be changed at any time. This is specified with an integer from 0 to 999999999.		
		This value is assigned to a new user account when the account is created.		
	-w warn	Sets the number of days until the actual expiration after the issuance of the alarm of the expiration date of the password to the user. This value is assigned when a new user account is created. The default is 7. This is specified with an integer from 0 to 999999999.		
OPERANDS	The following operat	nd is supported.		
	user Sp	ecifies the XSCF user account name.		
EXTENDED DESCRIPTION	<ul> <li>the password polition</li> <li>operand if the definition</li> <li>expires, or you for with the password user. You can exect policy.</li> <li>When the user with t</li></ul>	rd is changed with another user specified in the <i>user</i> operand, cy of the system is not reflected automatically. NAME	ping - Sends the	ECHO_REQUEST packet of ICMP to the host on the network.				
SYNOPSIS	ping [-c count] [-q] host					
	ping -h					
DESCRIPTION		nd to extract ECHO_RESPONSE from the specified host or eECHO_REQUEST datagram of ICMP.				
	XSCF and the spe	ecuted normally, you can determine that the network between ecified host or gateway is normal. It is also possible to measure the ance from the result.				
Privileges	To execute this co	ommand, any of the following privileges is required.				
		alhost," the loop-back address "127.0.0.0/8," and the interface nk is specified in <i>host</i>				
	fieldeng					
	<ul> <li>Other than above</li> <li>No privileges are required.</li> </ul>					
	For details on user privileges, see setprivileges(8).					
OPTIONS						
OPTIONS	The following options are supported.					
	-c count	Specifies the frequency to send a packet. If the specified number of packets is sent and the responses are received, ping is terminated. If omitted, packets continue to be sent until termination by the user.				
	-h	Displays the usage. Specifying this option with another option or operand causes an error.				
	-q	Controls the output. Outputs only at the time of start and termination without displaying the progress.				
OPERANDS	The following operands are supported.					
	host	Specifies the host name or IP address to which a packet is to be sent.				
EXAMPLES	EXAMPLE 1 Send	a packet to the host name, scf0-hostname0, three times.				
	PING scf0-host 64 bytes from 64 bytes from	<b>3 scf0-hostname0</b> name0 (192.168.1.100): 56 data bytes 192.168.1.100: icmp_seq=0 ttl=64 time=0.1 ms 192.168.1.100: icmp_seq=1 ttl=64 time=0.1 ms 192.168.1.100: icmp_seq=2 ttl=64 time=0.1 ms

NAME	poweroff - Shuts down the physical partition (PPAR).			
SYNOPSIS	<b>poweroff</b> [ [-q] - {y n}] [-f] [-M] -p <i>ppar_id</i>			
	poweroff [ [-q]	-{y n]	}][-M] -a	
	poweroff -h			
DESCRIPTION	poweroff is a co	mmand	to shut down PPAR.	
		-	cified PPARs. PPAR is shut down after the execution of the ssing for the Oracle Solaris.	
Privileges	To execute this command, any of the following privileges is required.			
	platadm, fielde	eng	Enables execution for all PPARs.	
	pparadm, pparmo	gr	Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-a	the pl They s	down all of the PPARs in operation. Only the users with atadm and fieldeng privileges can specify this option. hut down even during waiting for warm-up or air- ioning, or start processing of PPARs.	
	-f		ly shuts down the PPAR specified by XSCF. It is used with option.	
	-h		ys the usage. Specifying this option with another option rand causes an error.	
	- M	Displa	ys text one screen at a time.	
	-n	Autom	natically responds to prompt with "n" (no).	
	-p ppar_id	Depen integer	es the PPAR-ID of the physical partition to be shut down. ding on the system configuration, you can specify an from 0 to 15 for <i>ppar_id</i> . It does not shut down during g for warm-up or air-conditioning, or start processing for	
	-d	Prever output	ts display of messages, including prompt, for standard	
	-У	Autom	natically responds to prompt with "y" (yes).	

```
EXTENDED
                  • When you execute the command, a prompt to confirm whether to execute it with
DESCRIPTION
                     the specified contents is displayed. To execute, press the [y] key. To cancel, press
                     the [n] key.

    If the Oracle Solaris of the logical domain is running, the shutdown processing

                     equivalent to the -i 5 option of shutdown(1M) is executed.
                   • You cannot shut down PPAR if the Oracle Solaris of the logical domain is in
                     operation. Execute poweroff again after completion of start.
                   • If the Oracle Solaris of the logical domain is running in the single user mode, you
                     cannot shut it down using poweroff. Execute shutdown(1M) by the logical
                     domain.

    When you changed the configuration of the logical domain, execute the ldm

                     add-spconfig command on the control domain, to store the latest
                     configuration information in XSCF. If you do not store the information, the PPAR
                     stop processing may fail to work properly.

    If poweroff is executed, the shutdown result is displayed in the following

                     format for each of the specified PPARs.
                   Powering off
                                      Indicates normal end.
                   Not powering off Indicates error occurrence, which prevented shutdown. An
                                      error message is displayed with the result.
                   • You can confirm whether each PPAR on the system has shut down by using
                     showdomainstatus(8).
   EXAMPLES
                   EXAMPLE 1 Shut down all PPARs.
                    XSCF> poweroff -a
                    PPAR-IDs to power off:00,01,02,03
                    Continue? [y|n]:y
                    00:Powering off
                    01:Powering off
                    02:Powering off
                    03:Powering off
                     *Note*
                     This command only issues the instruction to power-off.
                     The result of the instruction can be checked by the "showlogs power".
                    XSCF>
                   EXAMPLE 2 Shut down PPAR-ID 0.
                    XSCF> poweroff -p 0
                    PPAR-IDs to power off:00
                    Continue? [y|n]:y
                    00:Powering off
```

```
*Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showlogs power".
                   XSCF>
                 EXAMPLE 3 Forcibly shut down PPAR-ID 0.
                   XSCF> poweroff -f -p 0
                   PPAR-IDs to power off:00
                   The -f option will cause domains to be immediately resets.
                   Continue? [y|n]:y
                   00:Powering off
                   *Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showlogs power".
                   XSCF>
                 EXAMPLE 4 Shut down PPAR-ID 2. The prompt is automatically given a "y" response.
                   XSCF> poweroff -y -p 2
                   PPAR-IDs to power off:02
                   Continue? [y|n]:y
                   02:Powering off
                   *Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showlogs power".
                   XSCF>
                 EXAMPLE 5 Shut down PPAR-ID 2. The message is hidden and the prompt is automatical-
                            ly given a "y" response.
                   XSCF> poweroff -q -y -p 2
                   XSCF>
EXIT STATUS
                 The following exit values are returned.
                                  Indicates normal end.
                 0
                 >0
                                  Indicates error occurrence.

poweroff(8)

NAME	poweron - Starts	the phys	sical partition (PPAR).
SYNOPSIS	<b>poweron</b> [ [-q] - {y n}] [-M] -p <i>ppar_id</i>		
	poweron [ [-q]	-{y n}	][-M] -a
	poweron -h		
DESCRIPTION	poweron is a com	nmand t	o start PPAR.
	Starts all of the sp	pecified	PPARs.
Privileges	To execute this co	ommand	, any of the following privileges is required.
	platadm, fielde	eng	Enables execution for all PPARs.
	pparadm, pparmo	gr	Enables execution for PPARs for which you have administration privilege.
	For details on use	er privile	eges, see setprivileges(8).
OPTIONS	The following options are supported.		
	-a	the use this op	all of the PPARs whose setup has been completed. Only ers with the platadm or fieldeng privilege can specify tion. "PPAR whose setup has been completed" means whose setting has been completed by setupfru(8).
	-h		ys the usage. Specifying this option with another option rand causes an error.
	- M	Displa	ys text one screen at a time.
	-n	Autom	atically responds to prompt with "n" (no).
	-p ppar_id	Depen	es the PPAR-ID of the physical partition to be started. ding on the system configuration, you can specify an from 0 to 15 for <i>ppar_id</i> .
	-đ	Preven output	ts display of messages, including prompt, for standard
	-У	Autom	atically responds to prompt with "y" (yes).
EXTENDED DESCRIPTION	<ul> <li>When you exect the specified control</li> <li>the [n] key.</li> </ul>	cute the ontents i	command, a prompt to confirm whether to execute it with is displayed. To execute, press the [y] key. To cancel, press

l

#### poweron(8)

```
    If poweron is executed, the start result is displayed in the following format for

                 each of the specified PPARs.
               Powering on
                                  Indicates normal start.
                                  Indicates error occurrence, which prevented start. An error
               Not Powering
                                  message is displayed with the result.
               on
               • You can confirm whether PPAR has been started by using showhardconf(8).
EXAMPLES
               EXAMPLE 1 Start all PPARs.
                XSCF> poweron -a
                 PPAR-IDs to power on:00,01,02,03
                 Continue? [y|n]:y
                 00:Powering on
                 01:Powering on
                 02:Powering on
                 03:Powering on
                 *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showlogs power".
               EXAMPLE 2 Start PPAR-ID 0.
                XSCF> poweron -p 0
                 PPAR-IDs to power on:00
                 Continue? [y|n]:y
                 00:Powering on
                 *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showlogs power".
                          Start PPAR-ID 0. The prompt is automatically given a "y" response.
               EXAMPLE 3
                XSCF> poweron -y -p 0
                 PPAR-IDs to power on:00
                 Continue? [y|n]:y
                 00:Powering on
                 *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showlogs power".

NAME	replacefru - Replaces the Field Replaceable Unit (FRU) and cabinet.
SYNOPSIS	replacefru
	replacefru -h
DESCRIPTION	replacefru is a command to replace the FRU and cabinet.
	You can interactively select, confirm, replace, etc. the FRU and cabinet required for replacement of FRU in the menu format.
	With replacefru, the following FRUs and cabinets can be replaced.
	■ Fan unit
	<ul><li>Power supply unit</li><li>SPARC M10-4S</li></ul>
	<ul> <li>Crossbar box</li> </ul>
Privileges	To execute this command, fieldeng privilege is required.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	replacefru can be executed only in the master XSCF. Attempting to execute it on a standby XSCF causes an error.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	reset - Resets the	specifie	d physical partition (PPAR) or a logical domain.
SYNOPSIS	<b>reset</b> [ [-q] - {y n}] -p <i>ppar_id</i> por		ppar_id por
	<b>reset</b> [ [-q] -{y	n}]-p	ppar_id -g hostname sir
	<b>reset</b> [ [-q] -{y	n}]-p	ppar_id -g hostname panic
	<b>reset</b> [ [-q] -{y	n}]-p	ppar_id xir
	reset -h		
DESCRIPTION		ll be use	e a failure of the disk, etc. because it forcibly resets the d exclusively for recovery in the case of hang-up of the
	reset is a comm	nand to 1	reset the specified PPAR or the logical domain.
	The following for	ur types	can be specified as the reset method.
	por	Resets	PPAR.
	sir	Resets	the logical domain.
	panic		panic to the Oracle Solaris of the logical domain. It is during shutdown processing or under suspension.
	xir	Resets	all CPUs in PPAR.
Privileges	To execute this command, any of the following privileges is required.		l, any of the following privileges is required.
	platadm, field	leng	Enables execution for all PPARs.
	pparadm, pparm	ıgr	Enables execution for PPARs for which you have administration privilege.
	For details on us	er privil	eges, see setprivileges(8).
OPTIONS	The following op	otions are	e supported.
	-g hostname		tes the host name of the logical domain to be reset. It can cified only if panic or sir is specified in <i>level</i> .
	-h	-	ys the usage. Specifying this option with another option rand causes an error.
	-n	Autom	natically responds to prompt with "n" (no).

## reset(8)

	-p ppar_id	Specifies only one PPAR-ID to be reset. Depending on the system configuration, you can specify an integer from 0 to 15 for	
	-d	<pre>ppar_id. Prevents display of messages, including prompt, for standard output.</pre>	
	-у	Automatically responds to prompt with "y" (yes).	
OPERANDS	The following op	perands are supported.	
	por	Resets PPAR.	
	sir	Resets the guest domain.	
	panic	Orders panic to the Oracle Solaris of the guest domain.	
	xir	Resets all CPUs in PPAR.	
EXTENDED DESCRIPTION	<ul> <li>When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.</li> </ul>		
	<ul> <li>You can confir showhardcon</li> </ul>	rm the current status of PPAR after ordering reset by using af(8).	
	<ul> <li>If reset is executed in the following status, the processing is stopped before to Oracle Solaris is started.</li> </ul>		
	■ The mode s	witch of the operation panel is in the Service mode.	
	<ul> <li>The autobo setpparmo</li> </ul>	ot function for the specified guest domain is disabled in ode(8).	
		ot function for the logical domain is disabled in OpenBoot PROM ent variable, auto-boot?.	
	add-spconfi configuration	inged the configuration of the logical domain, execute the ldm g command on the control domain, to store the latest information in XSCF. If you do not store the information, the reset y fail to work properly.	
EXAMPLES	EXAMPLE 1 Reset	the guest domain "GuestDomain0001" of PPAR-ID 0.	
	PPAR-ID:00 GuestDomain to Continue? [y r	<pre>p 0 -g GuestDomain0001 sir o sir:GuestDomain0001 n] :y n0001 :Resetting</pre>	

```
This command only issues the instruction to reset.
                    The result of the instruction can be checked by the "showdomainstatus".
                   XSCF>
                 EXAMPLE 2 Reset the CPU of PPAR-ID 0. The prompt is automatically given a "y" re-
                            sponse.
                   XSCF> reset -y -p 0 xir
                   PPAR-ID to reset:00
                   Continue? [y|n]:y
                   00 :Resetting
                   *Note*
                    This command only issues the instruction to reset.
                    The result of the instruction can be checked by the "showlogs power".
                   XSCF>
                 EXAMPLE 3 Reset PPAR-ID 0 immediately. The message is hidden and the prompt is au-
                            tomatically given a "y" response.
                   XSCF> reset -q -y -p 0 por
                   XSCF>
                 EXAMPLE 4 Cancel the executed reset in the middle.
                   XSCF> reset -p 0 -g GuestDomain0001 sir
                   PPAR-ID :00
                   GuestDomain to sir:GuestDomain0001
                   Continue? [y|n]:n
                   XSCF>

reset(8)

NAME		Resets the difference between the system time and the Hypervisor sical partition (PPAR).
SYNOPSIS	resetdateoffset [	[-q] -{y n}] -p ppar_id
	resetdateoffset [	$[-q] - \{y n\} [-a]$
	resetdateoffset -	h
DESCRIPTION		set is a command to reset the difference between the system time CF and the Hypervisor time managed by each PPAR.
	PPAR is stored. If between the Hyp	erence between the system time and the Hypervisor time of each f the system time is changed by setdate(8), etc., the difference pervisor time of each PPAR and changed system time is updated. ence of the time is retained even if PPAR or the system is restarted.
	Hypervisor time	set resets the difference between the system time and the of each PPAR. Thanks to this, the Hypervisor time of each PPAR t to the same time as the system time.
Privileges	To execute this command, any of the following privileges is required.	
	platadm, field	leng Enables execution for all PPARs.
	pparadm	Enables execution for PPARs for which you have administration privilege.
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following options are supported.	
	-a	Initializes the differences form the Hypervisor time of all PPARs.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-p ppar_id	Specifies the PPAR-ID to reset the time difference. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
	-đ	Prevents display of messages, including prompt, for standard output.
	- Y	Automatically responds to prompt with "y" (yes).

EXTENDED DESCRIPTION	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		
	<ul> <li>If no option is specified, the differences form the Hypervisor time of all PPARs are reset.</li> </ul>		
	<ul> <li>resetdateoffset shall be executed after PPAR has been shut down.</li> </ul>		
EXAMPLES	<b>EXAMPLE 1</b> Initialize the difference between the system time and the Hypervisor time of PPAR-ID 1.		
	XSCF> <b>resetdateoffset -p 1</b> Clear the offset of PPAR-ID 1? [y n] : <b>y</b> XSCF>		
	<b>EXAMPLE 2</b> Initialize the differences between the system time and the Hypervisor times of all PPARs.		
	XSCF> resetdateoffset -a Clear the offset of all PPARs? $[y n] : \mathbf{y}$ XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	restorecodactivation - Restores the CPU core Activation key.		
SYNOPSIS	<pre>restorecodactivation [-v] [-V] [[-q] - {y n}] [-P password] [-u user] [-p proxy [-t proxy_type]] url</pre>		
	restorecodactiva	tion -h	
DESCRIPTION		ivation is a command to restore the CPU core Activation key, y using the dumpcodactivation(8), to XSCF.	
Privileges		ommand, platadm or fieldeng privilege is required. You can vith the default and admin accounts initially prepared in the	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	- P password	Specifies the password to decode encrypted files. If the -P option is omitted when you restore the encrypted CPU core Activation key, the command prompts for the password. You can specify this using up to 128 characters.	
	-p proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> .	
	-q Prevents display of messages, including prompt, for standard output.		
	-t proxy_type	Specifies the proxy type. It is specified with the -p option. You can specify any of http, socks4, and socks5. The default is http.	
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.	
	- V	Displays detailed information. This option is used to diagnose server problems.	
	- V	Displays detailed network activities. This option is used to diagnose network and server problems.	
	-y Automatically responds to prompt with "y" (yes).		

OPERANDS	The following operands are supported	
	<i>url</i> Specifies the URL storing the CPU core Activation key. The following types of format are supported.	
	<pre>http://server[:port]/path/file https://server[:port]/path/file ftp://server[:port]/path/file file:///media/usb_msd/path/file</pre>	
EXTENDED DESCRIPTION	<ul> <li>The beginning of the CPU core Activation key which has been saved contains the basic identification information in text format. Using the text viewer, you can confirm the following information.</li> </ul>	
	<ul> <li>System at the time when the CPU core Activation key was saved</li> </ul>	
	<ul> <li>Date when it is saved</li> </ul>	
	<ul> <li>Whether it is encrypted</li> </ul>	
	<ul> <li>It is necessary to shut down all physical partitions (PPARs) before executing restorecodactivation.</li> </ul>	
	• The CPU core Activation key can be restored only in the same sever model.	
EXAMPLES	<b>EXAMPLE 1</b> Restore the CPU core Activation key which is saved on USB device.	
	<pre>XSCF&gt; restorecodactivation -v -V file:///media/usb_msd/cpukey.cfg initiating file transfer from 'file:///media/usb_msd/cpukey.cfg' transfer from '/ssd/transferred_file_cod.bin' to ' file:///media/usb_msd/cpukey.cfg' * Closing connection #0 file decoding done. Backup keys created on Tue Oct 16 13:19:46 2012 from system 'M10-4S' with serial number '2111205009', version '0001' validating backup keys data. *** The CPU core Activation keys are overwritten in the backup data. *** Do you want to restore this keys to your system? [y n]:y operation completed</pre>	
EXIT STATUS	The following exit values are returned.	
	0 Indicates normal end.	
	>0 Indicates error occurrence.

I

NAME	restoreconfig - Restores	the XSCF settings information.
SYNOPSIS	<b>restoreconfig</b> [-v] [-V] user] [-p proxy [-t proxy	[[-q] -{y n}][-P <i>password</i> ][-s network={yes no}][-u <i>y_type</i> ]] <i>url</i>
	restoreconfig -h	
DESCRIPTION	restoreconfig is a co dumpconfig in XSCF.	mmand to restore the XSCF settings information saved by
		the consistency of the XSCF settings information, searches and verifies whether the version of the XSCF settings tem class match.
Privileges		d, platadm privilege is required. You can execute it even admin accounts initially prepared in the system.
	For details on user privi	leges, see setprivileges(8).
OPTIONS	The following options a	re supported.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	- P password	Specifies the password to decode encrypted files. If the -P option is omitted when you restore the encrypted XSCF configuration information, the command prompts for the password. You can specify this using up to 128 characters.
	-p proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> . See Example 3.
	-d	Prevents display of messages, including prompt, for standard output.
	-snetwork={yes no}	Specifies whether to restore the network configuration. To restore the network configuration, specify yes. Not to restore the network configuration, specify no.
		If the -s option is omitted, the serial number of the target system is compared with that of the configuration information. If the numbers match, the network configuration is restored.
	-t proxy_type	Specifies the proxy type. It is specified with the -p option. You can specify any of http, socks4, and socks5. The default is http.

	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.
	-v	Displays detailed information. This option is used to diagnose server problems.
	- V	Displays detailed network activities. This option is used to diagnose network and server problems.
	-У	Automatically responds to prompt with "y" (yes).
OPERANDS	The following operand	s are supported
	-	ifies the URL storing the XSCF settings information. The wing types of format are supported.
	http: ftp:	b://server[:port]/path/file bs://server[:port]/path/file c//server[:port]/path/file e:///media/usb_msd/path/file
EXTENDED DESCRIPTION		SCF settings information, the basic identification information ext format. The following information can be confirmed
	_	e when the XSCF settings information was saved
	<ul> <li>Date when it is sa</li> </ul>	C
	<ul> <li>Whether it is encoded</li> </ul>	
		it down all physical partitions (PPARs) before executing
	■ restoreconfig do	wnloads the XSCF settings information and verifies whether prrect. When authentication is finished, XSCF is reset and
	■ The XSCF settings in	formation can be restored only in the same sever model.
EXAMPLES	<b>EXAMPLE 1</b> Restore the	XSCF settings information using USB.
	Making sure mount p umount: /media/usb_ Trying to mount USB mount: I could not	msd is not mounted (according to mtab) device /dev/sdb1 as /media/usb_msd determine the filesystem type, and none was specified device /dev/sdb as /media/usb_msd

	<pre>initiating file transfer from 'file:///media/usb_msd/system.cfg' transfer from '/ssd/transferred_file.bin' to 'file:///media/usb_msd/system.cfg' * Closing connection #0 Unmounted USB device done file decoding done. Configuration backup created on Tue Oct 9 10:31:22 2012 from system '2081208013' with serial number '2081208014', version '0001' validating backup configuration data : : *** Do you want to restore this configuration to your system? [y/n]:y requesting XSCF reboot to perform restore requested</pre>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

restoreconfig(8)

NAME	restoredefaults - Restores the XSCF configuration information and its backup to the default.		
SYNOPSIS	restoredefaults -c {factory   xscf}		
	restoredefaults -	h	
DESCRIPTION	restoredefaults is a command to restore the XSCF configuration information and its backup to the default.		
		predefaults, connect to XSCF by serial. If connected by XSCF- k connection is disconnected during execution.	
	The following ty	pes of initialization scope can be specified.	
	factory	Restores the entire system to the default. The information set by the user and error information of the XSCF configuration information and its backup are initialized.	
	xscf	Restores the XSCF configuration information to the default. The information set by the user and error information of the XSCF configuration information are initialized.	
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-c factory	Restores the entire system to the default.	
	-c xscf	Restores the XSCF configuration information to the default.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXTENDED DESCRIPTION	<ul> <li>restoredefaults is executed by the master XSCF. Confirm the master XSCF with showbbstatus(8).</li> <li>restoredefaults shall be executed in each SPARC M10-4S. Executing it with multiple SPARC M10-4S connected causes an error.</li> <li>After restoredefaults is executed, the XSCF configuration information is shut down. After shutdown, turn off the input power of the system and turn it on again.</li> <li>To transfer the unit mounted in XSCF to another system, specify -c xscf. The unit is initialized to the default and the input power of the system is turned off. After that, the unit can be transferred to another system.</li> </ul>		

	<ul> <li>If -c xscf is specified, the backup information remains. Therefore, if the input power of the system is turned on again after turned off, the stored backup information is read and the XSCF returns to the status before initialization. The unit mounted in XSCF contains the backup information. Therefore, do not transfer it to another system.</li> <li>restoredefaults shall be executed with the system shut down. If the system is not shut down, it causes an error.</li> <li>The status in which the system is shut down means the status in which all physical partitions (PPARs) are shut down. If PPAR is in operation, executing poweroff -a shuts down all PPARs and after that the power of the system is turned off. Execute the showhardconf(8) and see the display of "System_Power:" ("On" or "Off"), to confirm the condition of system power.</li> <li>After the command was executed, a CPU core Activation key, which had been registered to the system is deleted. To retain a CPU core Activation key, you must save this CPU core Activation key by executing the dumpcodactivation(8) beforehand. Be sure to execute restoredefaults</li> </ul>
	before executing the restorecodactivation(8) for the restoration of the saved CPU core Activation key.
	In a case where restoredefaults was executed before saving the CPU core Activation key, you must register a CPU core Activation key again.
EXAMPLES	<b>EXAMPLE 1</b> Restore the XSCF configuration information to the default.
	XSCF> restoredefaults -c xscf
	WARNING: If this system does not have BACK UP, this command will set all the user settable XSCF configuration parameters to their default value as they were set when the system was shipped out. Furthermore, this command will delete all logs in the intended chassis XSCF. Check the man page of this command before you run it.
	If this system does not have BACK UP, this command will set all the user settable XSCF configuration parameters to their default value as they were set when the system was shipped out. Furthermore, this command will delete all logs in the intended chassis XSCF.

NAME	sendbreak - Sends a break signal to the control domain of the specified physical partition (PPAR).		
SYNOPSIS	sendbreak [ [-q] - {y n}] -p ppar_id		
	sendbreak -h		
DESCRIPTION	sendbreak is a command to send a break signal to the control domain of the specified PPAR.		
	If a break signal is sent to the Oracle Solaris on PPAR from the control domain console, the control is transferred from Oracle Solaris to OpenBoot PROM and the prompt for OpenBoot PROM (ok) is displayed.		
	secure mode of a	ode switch of the operator panel is set to "Locked," setting the setpparmode(8) to "on" prevents transmission of a break signal. setpparmode(8).	
Privileges	To execute this command, any of the following privileges is required.		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID to which a break signal is to be sent. Depending on the system configuration, you can specify only one integer from 0 to 15 for <i>ppar_id</i> .	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		

## sendbreak(8)

EXAMPLES	EXAMPLE 1	Send a break signal to the control domain of PPAR-ID 0.	
	XSCF> <b>sendbreak -p 0</b> Send break signal to PPAR-ID 0?[y n] :		
EXIT STATUS	STATUS       The following exit values are returned.         0       Indicates normal end.		
	>0 Indicates error occurrence.

SYNOPSIS       setaltitude -s altitude= value         setaltitude -h       setaltitude is a command to set the altitude of the system.         Privileges       To execute this command, platadm or fieldeng privilege is required.         For details on user privileges, see setprivileges(8).	10		
DESCRIPTIONsetaltitude is a command to set the altitude of the system.PrivilegesTo execute this command, platadm or fieldeng privilege is required.For details on user privileges, see setprivileges(8).	10		
PrivilegesTo execute this command, platadm or fieldeng privilege is required.For details on user privileges, see setprivileges(8).	10		
For details on user privileges, see setprivileges(8).	10		
	10		
	10		
<b>OPTIONS</b> The following options are supported.	10		
-h Displays the usage. Specifying this option with another option or operand causes an error.	10		
-s altitude=value Sets the altitude of the system. Specifies the altitude of the location where the system is installed by meter (m) in value 0 or a larger integer can be specified by 100 m. Values less than 100 m are rounded up. The default value is 0 m.	ıe.		
<b>DESCRIPTION</b> detected early. If the altitude of the system is unknown, set a high altitude. If t	detected early. If the altitude of the system is unknown, set a high altitude. If the altitude of the system is not set, temperature abnormalities can be detected by an abnormality of the CPU temperature, etc. Therefore, the system will not be		
<ul> <li>To reflect the set contents, it is necessary to reset XSCF by using rebootxscf</li> <li>Negative numbers are not summarized in the altitude setting. If the altitude is</li> </ul>	(8).		
<ul> <li>Negative numbers are not supported in the altitude setting. If the altitude is below sea level, specify altitude=0.</li> </ul>			
<ul> <li>You can confirm the altitude of the system set currently by using showaltitude(8).</li> </ul>			
<b>EXAMPLES EXAMPLE 1</b> Set the altitude of the system to 1000 m.			
XSCF> <b>setaltitude -s altitude=1000</b> 1000m			
<b>EXAMPLE 2</b> Set the altitude of the system to 200 m. The specified value is rounded up the nearest 100 m.	to		
XSCF> <b>setaltitude -s altitude=157</b> 200m			

## setaltitude(8)

EXIT STATUS	The following exit values are returned.	
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	setaudit - Manages the audit function of	of the system.		
SYNOPSIS	setaudit enable disable archive delete			
	<pre>setaudit [-p count suspend] [ -m mailaddr] [-a users=enable disable default][-c classes= {enable disable}][-e events=enable disable][-g {enable disable}][-t percents]</pre>			
	setaudit -h			
DESCRIPTION	setaudit is a command to manage collection of data on the use of the system resources.			
	Audit data contains the record of the system event related to security. This data can be used for assignment of responsibilities to the actions executed in the system. In audit, the record is generated when the specified event occurs. The events which generate an audit record are below.			
	• Start and shutdown of the system			
	<ul><li>Login and logout</li><li>Action of authentication</li></ul>			
	<ul> <li>Action of administration</li> </ul>			
Privileges	To execute this command, auditadm p	privilege is required.		
_	For details on user privileges, see set	privileges(8).		
OPTIONS	The following options are supported.			
	-a <i>users</i> =enable disable default	Sets the audit record generation policy of the specified user. <i>users</i> is the comma- separated list of the valid user names.		
		If enable or disable is set, the audit record generation of the user becomes enable or disable, respectively. This setting disables the global policy of each specified user. To set the global policy of the user, use the -g option.		
		Setting this to default enables the global policy for the policy of the user. To confirm the global audit record policy of the user, use showaudit -g.		

-c *classes*=enable|disable Changes the audit record generation policy of the specified audit class. *classes* is a comma-separated list of audit classes. Classes can be specified with a number or name. ACS prefix can be omitted. For example, the classes of audit-related events can be expressed as ACS AUDIT, AUDIT or 16. The valid classes are below. all All classes ACS SYSTEM(1) System-related event ACS WRITE(2) Command that can change the status ACS READ(4) Command to read the current status ACS LOGIN(8) Login-related event ACS AUDIT(16) Audit-related event ACS PPAR(32) Physical partition (PPAR) administration-related event ACS USER(64) User administration-related event ACS PLATFORM(128) Platform administration-related event ACS MODES (256) Mode-related event You can specify more than one of these options. If more than one of these options are specified, they are handled in the order of the list with the -e option. See Example 1. If enable or disable is set, the audit record generation of the specified class becomes enable or disable, respectively. It is possible to disable these settings for individual events by using the -e option. The audit record generation policies of classes and events are applied to all users. It is impossible to specify a unique policy

of class or event for each individual user.

-e <i>events</i> =enable disable	Changes the audit record generation policy of the specified audit event. <i>events</i> is a comma-separated list of audit events. Events can be specified with a number or name. AEV_prefix can be omitted. For example, the evant of SSH login can be expressed as AEV_LOGIN_SSH, LOGIN_SSH, or 0.
	For the list of valid events, see showaudit -e all.
	You can specify more than one of these options. If more than one of these options are specified, they are handled in the order of the list with the -c option. See Example 3.
	If enable or disable is set, the audit record generation of the specified event becomes enable or disable, respectively. Setting these options disables the settings of classes for events. The settings of classes are set by the -c option.
	The audit record generation policies of classes and events are applied to all users. It is impossible to specify a unique policy of class or event for each individual user.
-g enable disable	Sets the global audit record generation policy of the user.
	If it is set to disable, no audit record which can attribute to all user accounts is generated. These settings may be disabled depending on individual users by the -a option.
-h	Displays the usage. Specifying this option with another option or operand causes an error.

-m <i>mailaddr</i>	Sets the address of the e-mail sent when the usage of the local audit area reaches the threshold (See the -t option). The e-mail address needs to be an e-mail address in a valid format, "user@company.com." Specifying none in <i>mailaddr</i> disables e-mail notification.
-p suspend count	Sets the policy to be followed if the audit trail reaches the full capacity. The valid values are below.
	<pre>suspend Until free space is secured and it becomes possible to write on the record, or the policy is changed into count, all processes to write on the audit record are suspended. count New audit records are deleted. The number of the records to be deleted are counted.</pre>
-t percents	Sets the threshold to issue a warning for the usage of the local region. <i>percents</i> is a comma-separated list showing the percentage of the used area. Up to four values can be set in this list. For example, if the values, 50, 75, 80, and 90 are set, a warning is issued when the usage of the ares available for audit records reaches 50%, 75%, 80%, and 90%, respectively. The default is 80%.
	A warning is issued as a message to the console. Optionally, it is also possible to issue a warning to the administrator by using e-mail. See -m <i>mailaddr</i> .

# **OPERANDS** The following operands are supported.

	archive	Archive Notifies the archive mechanism of logs to archive the current audit trail.		
	delete	e Deletes the data of audit trail from the partition of audit logs in chronological order and uses the current partition. delete can be used to secure the area for new audit records when the local audit trail reaches the full capacity. The space in a partition is automatically cleared when logs are archived, if necessary. Operations are required only if a problem with the audit policy or network interrupts archiving of audit logs.		
		<b>Note</b> – If setaudit delete is executed twice, data is deleted from the partitions of audit logs in reverse chronological order and no data of audit trail is kept.		
		For details on administration of audit logs, see the SPARC M10 Systems System Operation and Administration Guide.		
	disable Disables writing audit records on audit trail. After that, notifies the archive mechanism of logs to archive the cur audit trail.			
	enable	Enables writing audit records on audit trail.		
EXTENDED DESCRIPTION	It is possible to confirm the contents of the audit system set currently by using showaudit(8).			
EXAMPLES	<b>EXAMPLE 1</b> Change the class by name. Disable the login- and audit-related audit classes and enable the lead-related audit classes.			
	XSCF> <b>se</b>	taudit -c LOGIN,AUDIT=disable -c ACS_READ=enable		
	<b>EXAMPLE 2</b> Change the class by number. Disable the classes 8 (login) and 16 (audit) and enable 1 (system).			
	XSCF> <b>setaudit -c 8,16=disable -c 1=enable</b>			
	EXAMPLE 3	Change the class and enable the event. Disable the event 64 (user) only and enable the class 1 (system).		
	XSCF> <b>se</b>	taudit -c 1=enable -e 64=disable		
	EXAMPLE 4	Enable audit. Enable writing on records for audit trail.		
	XSCF> <b>se</b>	taudit enable		

## setaudit(8)

	EXAMPLE 5 Enab	le warning. If the capacity reaches 50% or 75%, a warning is sent.	
EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	showaudit (8)		

NAME	setautologout - Sets the session timeout time of XSCF shell.		
SYNOPSIS	setautologout -s timeout		
	setautologout -h		
DESCRIPTION	setautologout	is a command to set the session timeout time of XSCF shell.	
	The default timeout time is 10 minutes.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-s timeout	Specifies the session timeout time of XSCF shell. Specify the time to timeout in <i>timeout</i> by minutes. You can specify an integer from 1 to 255.	
EXTENDED DESCRIPTION	<ul> <li>The set session timeout time becomes valid from the next login.</li> <li>You can confirm the session timeout time of XSCF shell set currently by using showautologout(8).</li> </ul>		
EXAMPLES	EXAMPLE 1 Set th	ne session timeout time of XSCF shell to 30 minutes.	
	XSCF> <b>setauto</b> 30min	blogout -s 30	
EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	showautologout	showautologout (8)	

setautologout(8)

NAME	setcod - Sets the Capacity on Demand (CoD) resources to be used in the physical partition (PPAR).		
SYNOPSIS	setcod -s cpu		
	setcod -p ppar_id -s cpu		
	setcod -p ppar_id -s cpu permits		
	setcod -h		
DESCRIPTION	setcod is a command to set the CoD resources to be used in PPAR.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-p ppar_id	Specifies PPAR-ID. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
		If -p <i>ppar_id</i> is not specified, you can specify the number of the CPU core Activations interactively for each PPAR. The prompt to enter the number of the CPU core Activations shows the possible maximum value of the number in round brackets and the number currently set in square brackets ([]). If the number of the keys is not specified, the current value is retained.	
	-s cpu	Sets the allocation of the CoD resources of CPU used in PPAR.	
OPERANDS	The following operands are supported.		
	permits	Specifies the number of the CPU core Activations allocated for PPAR. You can specify 0 or a higher integer.	
		The units of CPU core Activations allocated are 1 core for CPU.	
		You cannot set a value higher than the number of the CPU core Activations available. You can confirm the number of the CPU core Activations available by showcodusage -p resource.	
EXTENDED DESCRIPTION	If showcod(8) is	used, the CoD information currently set is confirmed.	

EXAMPLES	<b>EXAMPLE 1</b> Set the number of the CPU core Activations to be allocated for PPAR.				
	XSCF> setcod -s cpu

NAME	setdate - Sets the date and time of the XSCF clock.			
SYNOPSIS	<b>setdate</b> [ [-q] - {y n}] [-u] - s <i>date</i>			
	setdate -h			
DESCRIPTION	setdate is a con	mmand to set the date and time	e of the XSCF clock.	
	If the local time (JST) is specified without specifying the -u option when set date and time, it is set after converted to the coordinated universal time (U			
	After the comma	nd is executed, XSCF is autom	atically reset.	
Privileges	To execute this c	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).			
<b>OPTIONS</b>	The following options are supported.			
	-h	Displays the usage. Specifyir or operand causes an error.	ng this option with another option	
	-n	Automatically responds to p	rompt with "n" (no).	
	-d	Prevents display of messages output.	s, including prompt, for standard	
	-s date	Sets the date and time. <i>date</i> can be specified in either of the following formats.		
		yyyy.MM.DD-hh:mm:ss	"Year.Month.DateHour (24 hour format):minute:second"	
		MMDDhhmmyyyy.ss	"Month Date Hour (24 hour format) Minute Year.Second"	
	-u	Specifies the time and date in	e time and date in UTC. If omitted, it becomes JST.	
	-У	Automatically responds to pa	rompt with "y" (yes).	
EXTENDED DESCRIPTION	<ul> <li>When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.</li> <li>Setting the time by setdate may affect the difference from the Hypervisor time of each physical partition (PPAR) and cause a mismatch of the time when PPAR is started. After setting the time, confirm the difference between XSCF and the Hypervisor time of each PPAR by using showdateoffset(8). If the difference becomes large, reset the difference of the time by resetdateoffset(8).</li> <li>If an NTP server is set for XSCF, the time is not set. You can confirm whether an NTP server is set in XSCF by showntp(8).</li> </ul>			

	• You can confirm the date and time of XSCF set currently by using showdate(8).			
EXAMPLES	<b>EXAMPLE 1</b> Specify "October 20, 2012 16:59:00" in JST and set it after converting it into UTC. After the setting is made, XSCF is reset.			
	<pre>XSCF&gt; setdate -s 102016592012.00 Sat Oct 20 16:59:00 JST 2012 The XSCF will be reset. Continue? [y n] :y Sat Oct 20 7:59:00 UTC 2012 XSCF&gt; (After this, the reset processing continues.)</pre>			
	<b>EXAMPLE 2</b> Set the current time to "October 20, 2012 07:59:00" in UTC. After the setting is made, XSCF is reset.			
	<pre>XSCF&gt; setdate -u -s 102007592012.00 Sat Oct 20 07:59:00 UTC 2012 The XSCF will be reset. Continue? [y n] :y Sat Oct 20 7:59:00 UTC 2012 XSCF&gt; (After this, the reset processing continues.)</pre>			
	<pre>EXAMPLE 3 Set the current time to "October 20, 2012 16:59:00" in JST. The prompt is auto- matically given a "y" response. After the setting is made, XSCF is reset. NAME	setdomainconfig - Specifies the logical domain configuration when the physical partition (PPAR) is started.				
SYNOPSIS	setdomainconfig -p ppar_id				
	setdomainconfig	;[[-q]-	{y n}] -p ppar_id -i index		
	setdomainconfig	;[[-q]-	<pre>{y n}] -p ppar_id -c default</pre>		
	setdomainconfig	<b>;</b> -h			
DESCRIPTION	setdomainconfig is a command to specify the logical domain configuration when the PPAR is started next time.				
	domain configur logical domain c	If setdomainconfig is executed without specifying -i <i>index</i> , the list of the logical domain configurations is displayed on the prompt and then specify the Index of the logical domain configuration used when PPAR is started next time. If Index is not specified, the current setting is retained.			
Privileges	To execute this c	ommand	, any of the following privileges is required.		
	platadm, field	leng	Enables execution for all PPARs.		
	pparadm		Enables execution for PPARs for which you have administration privilege.		
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-c default	Sets the logical domain configuration to the factory settings (factory-default).			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	-i index	Specifies the administration number specified for the logical domain configuration. The administration number can be confirmed by showdomainconfig(8). You can specify an integer from 1 to 8.			
	-n	Autom	atically responds to prompt with "n" (no).		
	-p ppar_id		es the PPAR-ID to set the logical domain configuration. can be 0-15 depending on the system configuration.		
	-d	Preven output	ts display of messages, including prompt, for standard		
	-У	Autom	atically responds to prompt with "y" (yes).		

```
    The logical domain configuration is saved by Logical Domains (LDoms)

  EXTENDED
DESCRIPTION
                Manager.
              When you execute the command, a prompt to confirm whether to execute it with
                the specified contents is displayed. To execute, press the [y] key. To cancel, press
                the [n] key.
              • You can confirm the contents of the logical domain configuration set currently by
                using showdomainconfig(8).
  EXAMPLES
              EXAMPLE 1 Set the logical domain configuration of PPAR-ID 0 to "ldm-set1."
               XSCF> setdomainconfig -p 0
               PPAR-ID :0
                Booting config
                (Current) :ldm-set2
                (Next) :ldm-set2
                _____
                _ _ _ _ _
                     :1
                Index
                config name :factory-default
                domains :1
                date created:-
                _____
                _ _ _ _ _
                Index :2
                config name :ldm-set1
               domains :8
                date_created:'2012-08-08 11:34:56'
                _____
                _ _ _ _ _
                Index :3
                config name :ldm-set2
                domains :20
               date created: '2012-08-09 12:43:56'
                _____
                _ _ _ _ _
               Select Index of Using config name :2
                PPAR-ID of PPARs that will be affected :00
               Logical domain config name will be set to "ldm-set1".
                Continue? [y|n] :y
              EXAMPLE 2 Set the logical domain configuration of PPAR-ID 0 to "ldm-set2."
               XSCF> setdomainconfig -p 0 -i 1
               Index :1
                config name :ldm-set2
                domains :8
               date created: '2012-08-08 11:34:56'
                PPAR-ID of PPARs that will be affected:00
                Logical domain config name will be set to "ldm-set2".
                Continue? [y | n] : y
```

EXIT STATUS	<pre>EXAMPLE 3 Set the logical domain configuration of PPAR-ID 0 to the default. The prompt is automatically given a "y" response. XSCF&gt; setdomainconfig -y -p 0 -c default PPAR-ID of PPARs that will be affected :00 Logical domain config_name will be set to "factory-default". Continue? [y n] :y The following exit values are returned.</pre>

setemailreport(8)

sethostname - Sets the host names and DNS domain names of the master cabinet and cabinets whose XSCFs are standby.				
sethostname xscfu hostname				
sethostname -d domainname				
sethostname -h				
sethostname is a command to set the host names and DNS domain names of the master cabinet and cabinets whose XSCFs are standby.				
To execute this command, platadm privilege is required.				
For details on user privileges, see setprivileges(8).				
The following options are supported.				
-d <i>domainname</i> Specifies the DNS domain names to be set for the master cabinet/cabinets whose XSCFs are standby. <i>domainname</i> is specified with the label elements separated by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) It shall be specified keeping the number of characters including that of <i>hostname</i> 253 or lower. The reason why the number of characters is 253 or lower is that two characters are kept for one period to connect <i>hostname</i> with <i>domainname</i> and another one to indicate the root domain.				
-h Displays the usage. Specifying this option with another option or operand causes an error.				

OPERANDS	l	The following operands are supported.

	hostname	Specifies the host names to be set for the master cabinet and cabinets whose XSCFs are standby. Specifies it not by the Fully Qualified Domain Name (FQDN) but within 63 characters in the abbreviated format. It shall be specified keeping the number of characters including that of <i>domainname</i> 253 or lower. The reason why the number of characters is 253 or lower is that two characters are kept for one period to connect <i>hostname</i> with <i>domainname</i> and another one to indicate the root domain. <i>hostname</i> is specified with the label elements separated by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.)				
	xscfu	Specifies the cabinet to be set. Depending on the system configuration, you can specify it as follows. Omitting this causes an error.				
		■ For SPARC M10	0-4S (with crossbar box)			
		XBBOX#80 XBBOX#81	xbbox#80 xbbox#81

NAME	sethttps - Sets the start and halt of the HTTPS service used in the XSCF network. Also it performs authentication-related settings.						
SYNOPSIS	sethttps [[-q]-{y n}] -c {enable disable}						
	<b>sethttps</b> -c gencsr country state   province locality organization organizationalunit common e-mail						
	sethttps [ [-q] -{ $y \mid n$ }] -c genserverkey						
	sethttps -c importca						
	$\begin{array}{l} \textbf{sethttps} \left[ \left[ -q \right] - \left\{ y \left  n \right\} \right] - \texttt{c selfsign } \textit{country state} \mid \textit{province locality organization} \\ \textit{organizationalunit common e-mail} \end{array} \right.$						
	sethttps -h						
DESCRIPTION	sethttps is a command to set the start and halt of the HTTPS service used in the XSCF network. It also performs authentication-related settings used in the HTTPS service.						
	The following contents can be set as authentication-related items.						
	<ul> <li>Self-certificate-related settings</li> </ul>						
	<ul> <li>Construction of self-certificate authority</li> </ul>						
	<ul> <li>Generation of private keys of Web servers</li> </ul>						
	<ul> <li>Creation of self-signed Web server certificates</li> </ul>						
	<ul> <li>External certificate-related settings</li> </ul>						
	<ul> <li>Generation of private keys of Web servers</li> </ul>						
	<ul> <li>Generation of certificate signing requests (CSR) for Web servers and requests for issuance of certificates</li> </ul>						
	<ul> <li>Import of Web server certificates</li> </ul>						
	In multi-XSCF configuration, the settings are automatically reflected in the standby XSCF.						
Privileges	To execute this command, platadm privilege is required.						
	For details on user privileges, see setprivileges(8).						

# sethttps(8)

OPTIONS	The following options are supported.					
	-c {enable disable}		Specifies the start and half of the HTTPS service. You can specify either of the following. Omitting this causes an error.			
			enable disable	Starts HTTPS service. Halts HTTPS service.		
			If there is no Web server private key or Web server certificate when starting HTTPS service, creates a Web server private key and self-signed Web server certificate after creating a self-certificate authority and starts HTTPS service.			
			After HTTPS service is started, the settings are reflected when command execution is completed and the service is started.			
	-c gencsr Generates CSR.					
	-c genserverke	еy	Creates private key for Web server.			
	-c importca		Imports the Web server certificate signed at the certificate authority to XSCF.			
	-c selfsign		Constructs a self-certificate authority. It also creates a self- signed Web server certificate.			
	-h	Displays the usage. Specifying this option with anothe option or operand causes an error.				
	-n		Automatically resp	ponds to prompt with "n" (no).		
	-đ		Prevents display o standard output.	of messages, including prompt, for		
	-У		Automatically resp	ponds to prompt with "y" (yes).		
OPERANDS	The following ope	The following operands are supported.				
	common	name	of servers within ( sign, you cannot s	ne such as the creator name and host 64 characters. When specifying -c specify values containing only space		
	country	When		e with two characters such as JP and US. lfsign, you cannot specify values naracters.		
	e-mail	Specif	fies the e-mail add	ress within 64 characters.		

	locality	Specifies the name of a city, etc. within 64 characters.	
	organization	Specifies the name of a company, etc. within 64 characters. When specifying -c selfsign, you cannot specify values containing only space characters.	
	organizationalunit	Specifies the names of a division and department, etc. within 64 characters.	
	state   province	Specifies the names of a state and prefecture, etc. within 64 characters. When specifying -c selfsign, you cannot specify values containing only space characters.	
	Format rules of o	perands:	
	<ul> <li>If any symbols or space characters are included in the value, specify the value enclosing it in single quotation marks (') or double quotation mark "Kawasaki city."</li> </ul>		
	<ul> <li>To specify space characters only, specify the space characters enclosing it in single quotation marks (') or double quotation marks (") like " ". However, the are operands for which values composed of space characters only cannot be specified. For details, see the explanation of each operand.</li> </ul>		
	■ To create CSR,	you cannot specify space characters for any operands.	
	<ul> <li>To omit operands, specify two continuous single quotation marks (') or do quotation marks (") like "". At this time, a Web server certificate is generate based on the contents set initially.</li> </ul>		
	<ul> <li>To include a bab before it like "</li> </ul>	ackslash (\) or dollar mark (\$), specify it with a backslash (\) just $\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$	
	<ul> <li>As for -c self</li> <li>See the format</li> </ul>	Esign or -c gencsr, the specification order of operands is fixed.	
EXTENDED DESCRIPTION	<ul> <li>When you execute the command, a prompt to confirm whether to execute it we the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.</li> </ul>		
	<ul> <li>CSR is created</li> </ul>	by overwriting.	
		TPS service, the contents of settings are reflected just after ethttps, and the service is started.	
	HTTPS service	Veb server private key or Web server certificate when starting , creates a Web server private key and self-signed Web server creating a self-certificate authority and starts HTTPS service.	
		service is reflected just after execution of sethttps. At this time, sions in operation are disconnected, if any.	

#### sethttps(8)

 Creation of Web server private keys, (-c genserverkey), import of server certificates (-c importca), construction of self-certificate authority, and creation of self-signed Web server certificates (-c selfsign) can be executed only when HTTPS service is halted. • You can confirm the contents of the HTTPS service set currently by using showhttps(8). EXAMPLES **EXAMPLE 1** Start HTTPS service. XSCF> sethttps -c enable Continue? [y|n] :**y EXAMPLE 2** Halt HTTPS service. XSCF> sethttps -c disable Continue? [y|n] :**y** If there is no Web server certificate when executing enable, create a self-cer-EXAMPLE 3 tificate authority and self-signed Web server certificate, and start HTTPS service. XSCF> sethttps -c enable The Web serverkey or Web server certificate which has been signed by an external certification authority does not exist. Create self certification authority and Web server certificate which has been self signed. Continue? NAME	setlocator - Sets the blinking status of the CHECK LED of the operation panel.		
SYNOPSIS	setlocator [-b bb_id] value		
	setlocator -h		
DESCRIPTION			e blinking status of the CHECK LEDs of the M10 Systems cabinets and crossbar boxes.
	The following sta	atuses can be set.	
	Blinking	Blinks CHECK LE	D.
	Blinking cancel	Cancels blinking c	of CHECK LED.
Privileges	To execute this co	ommand, platadm	or fieldeng privilege is required.
	For details on use	er privileges, see se	tprivileges(8).
OPTIONS	The following op	tions are supported	
	-b bb_id	set the blinking sta system configurat	C M10 Systems cabinets and crossbar boxes to atus of the CHECK LEDs. Depending on the ion, you can specify any of the following omitted, the blinking status of the CHECK binet is set.
		SPARC M10-4S (without crossbar box) 0 to 15	
		SPARC M10-4S (with crossbar box) 0 to 15, 80 to 83	
		SPARC M10-1/M10-4 0	
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.
OPERANDS	The following operands are supported.		
	value	Specifies the status following.	s of CHECK LED. You can specify either of the
		blink	Blinks CHECK LED.
		reset	Cancels blinking of CHECK LED.

setlocator(8)

EXTENDED DESCRIPTION	You can confirm the status of CHECK LED set currently by using showlocator(8).
EXAMPLES	<b>EXAMPLE 1</b> Blink the CHECK LED of BB-ID 1.
	XSCF> <b>setlocator -b 1 blink</b> XSCF>
	<b>EXAMPLE 2</b> Cancel blinking of the CHECK LED of BB-ID 80.
	XSCF> <b>setlocator -b 80 reset</b> XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	showlocator (8)

NAME	setloginlockout - Enables or disables the lockout function when logging in.		
SYNOPSIS	setloginlockout -s unlock= time		
	setloginlockout -	-h	
DESCRIPTION		ut is a command to set the time when the user account cannot in login three times in a row.	
Privileges	To execute this co	ommand, useradm privilege is required.	
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following op	tions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-s unlock= <i>time</i>	Specifies the lockout time of the user account by minutes. You can specify it within the range from 0 to 1440 (24 hours). The default value is 0 minute and the lockout function is disabled.	
EXTENDED DESCRIPTION	<ul> <li>If the lockout function for login is set, the user can try logging in three times in a row. Enter the user account name in the login prompt and press the [Enter] key, and then login will succeed. At this time, even if the user account name is entered without password or login causes timeout, it is recognized as login. If login fails three times in a low, login becomes impossible for the set period after that. The user can enter the user account name and password even during lockout, but even if the correct password is entered, the login will be rejected. Even if login fails during lockout, the lockout time is not prolonged.</li> </ul>		
	<ul> <li>setloginlockout -s 0 disables the lockout function of the user account. If the lockout function is disabled, login and failure can be repeated without limitation.</li> <li>If the lockout function of the user account is enabled again after disabled, the locked out user can try logging in until the function is enabled again after disabled. However, if login is not attempted until the lockout function is enabled again, there is no change and lockout continues as in the case that lockout is not disabled and enabled again.</li> <li>You can confirm the lockout function of the user account set currently by using showloginlockout(8).</li> </ul>		
EXAMPLES	EXAMPLE 1 Set th	e timeout time of lockout to 90 minutes.	
	XSCF> <b>setlogi</b> 90 minutes	nlockout -s 90	

# setloginlockout(8)

EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	setnameserver - Sets or deletes the name server and search path used in XSCF network.		
SYNOPSIS	setnameserver [-c add] address		
	setnameserver -	c del <i>address</i>	
	setnameserver -	cdel-a	
	setnameserver -	c addsearch <i>domainname</i>	
	setnameserver -	c delsearch domainname	
	setnameserver -	c delsearch -a	
	setnameserver -	h	
DESCRIPTION	setnameserver in XSCF network	is a command to set/delete the name server and search path used	
	In XSCF, up to three name servers can be registered. If the number exceeds three, it causes an error. Up to five search paths can be registered. If the number exceeds five, it causes an error.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Deletes all of the name servers or search paths registered currently. To delete name server, use it with -c del. To delete search path, use it with -c delsearch.	
	-c add	Registers a name server. It is used with <i>address</i> . If you omit the -c option, -c add is assumed specified. To register a name server, the existing settings are deleted and the host specified by <i>address</i> is added.	
	-c addsearch	Registers a search path. It is used with <i>domainname</i> . If you omit the -c option, -c add is assumed specified. To register a search path, the existing settings are deleted and the domain name specified by <i>domainname</i> is added.	

	-cdel	Deletes a name server. If you omit the -c option, -c add is assumed specified. When you delete multiple name servers, the are deleted in the order of setting.	
	-cdelsearch	Deletes a search path. If you omit the -c option, -c add is assumed specified. You can make multiple specifications by separating them with spaces.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
<b>OPERANDS</b>	The following op	perands are supported.	
	address	Specifies the IP address of the name server to be registered or deleted. Specify it putting a period (.) between four sets of integer values. This can be specified using the following format. You can make up to three specifications by separating them with spaces.	
		xxx.xxx.xxxxxxSpecifies an integer from 0 to 255. This can be specified using zero suppression.	
		You cannot specify a loop-back address (127.0.0.0/8), network address, or broadcast address. Setting this may cause a failure in name resolution.	
	domainname	Specifies the domain name of the search path to be registered or deleted. You can make up to five specifications by separating them with spaces. <i>domainname</i> is specified within 256 characters by separating the label elements by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. At the end, put a period (.) representing the root domain (Based on RFC 1034).	
EXTENDED DESCRIPTION	<ul> <li>If multiple name servers are registered, name resolution is performed in the order of registering.</li> <li>The registered search path is used, for example, for referring to the name server for the host name by using nslookup(8). The host name specified by nslookup(8), followed by the domain name registered in the search path is confirmed with the name server in the FQDN format.</li> </ul>		
	subdomain.ex	If the following command is executed after registering ample.com to the search path, hostname.subdomain.example.com vith the name server.	

	XSCF> nslookup hostname		
	<ul> <li>If multiple search paths are registered, domain names are attached in the order of registering and confirmed with the name server.</li> </ul>		
	<ul> <li>Specifies the DNS domain name set by sethostname(8) and the search path set by setnameserver within 256 characters in total.</li> </ul>		
	<ul> <li>To reflect a name server and search path in XSCF, execute applynetwork(8).</li> <li>Reflect it in XSCF by applynetwork(8) and reset XSCF by using rebootxscf(8), and then setting is completed.</li> </ul>		
	<ul> <li>You can confirm the contents of the name server and search path set currently by using shownameserver(8).</li> </ul>		
EXAMPLES	<b>EXAMPLE 1</b> Register the hosts whose IP addresses are 192.168.1.2, 10.18.108.10, 10.24.1.2 as the name server. Name resolution is performed in the order of registering.		
	XSCF> setnameserver 192.168.1.2 10.18.108.10 10.24.1.2		
	<b>EXAMPLE 2</b> Delete the host whose IP address is 10.18.108.10 from the name server.		
	XSCF> setnameserver -c del 10.18.108.10		
	<b>EXAMPLE 3</b> Delete all of the registered name servers.		
	XSCF> setnameserver -c del -a		
	<b>EXAMPLE 4</b> Register the domain names search1.com, search2.com, search3.com, search4.com, and search5.com to the search path.		
	XSCF> setnameserver -c addsearch search1.com search2.com search3.com search4.com search5.com		
	<b>EXAMPLE 5</b> Delete the domain name search5.com from the search path.		
	XSCF> setnameserver -c delsearch search5.com		
	<b>EXAMPLE 6</b> Delete all of the registered domain names from the search path.		
	XSCF> setnameserver -c delsearch -a		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

setnameserver(8)

NAME	setnetwork - Sets or deletes the network interface to be used in XSCF.		
SYNOPSIS	<pre>setnetwork [-m addr] interface address</pre>		
	setnetwork -c {up down} interface		
	setnetwork [[-q] - {y n}] -r interface		
	setnetwork -h		
DESCRIPTION	setnetwork is a command to set or delete the network interface to be used in XSCF.		
	The following contents can be set or deleted for the network interface of XSCF-LAN.		
	<ul> <li>Whether to enable or disable the network interface</li> </ul>		
	<ul><li>IP address</li><li>Netmask</li></ul>		
	If an IP address or netmask is set, the specified network interface is enabled at the		
	same time as setting.		
	If the network interface is deleted, the specified network interface is disabled at the same time as deletion. Also, if the routing information is set in the target network interface, it is deleted at the same time and its status becomes down.		
	If applynetwork(8) is executed setting down, the interface is disabled even with an IP address and netmask set.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		

### setnetwork(8)

OPTIONS	The following options are supported.			
	-c {up down}	Specifies whether to enable the specified network interface. You can specify either of the following. Omitting this causes an error.		
		up down	Enables the network interface. Disables the network interface.	
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.	
	-m addr	Specifies the netmask. <i>addr</i> is specified in a format using four sets of integers separated by periods (.). This can be specified using the following format.		
		xxx.xxx.xxx.xxx xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.	
If the -m option is omitted, one of the following ne is set depending on the IP address specified by th operand.		8		
		• If the specified IP address is Class A (e.g. 20.1.1.1)		
		A netmask valu	A netmask value of 255.0.0.0 is set.	
		<ul> <li>If the specified IP address is Class B (e.g. 136.18.1.1)</li> <li>A netmask value of 255.255.0.0 is set.</li> </ul>		
		• If the specified IP address is Class C (e.g. 200.18.108.1)		
	A netmask value of 255.255.255.0 is set.		ue of 255.255.255.0 is set.	
	-n	Automatically resp	ponds to prompt with "n" (no).	
	-q Prevents display of messages, including prompt, for output.		of messages, including prompt, for standard	
	-r	Deletes the IP add	ress and netmask of the network interface.	
	-У	Automatically resp	ponds to prompt with "y" (yes).	

## **OPERANDS** | The following operands are supported.

address	Specifies an IP address. <i>address</i> is specified in a format using four sets of integers separated by periods (.).			
	xxx.xxx.xxx			
	xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.		
		v a loopback address (127.0.0.0/8), network address, or Class D, E address (224.0.0.0 to		
interface	Specifies the network interface to be set. You can specify any the following.			
	■ For SPARC M10	0-4S (with crossbar box)		
	xbbox#80-lan#0 xbbox#80-lan#1 lan#0			
	xbbox#81-lan#0 xbbox#81-lan#1 lan#1			
	<ul> <li>For SPARC M10-4S (without crossbar box)</li> </ul>			
	bb#00-lan#0 bb#00-lan#1 lan#0 bb#01-lan#0 bb#01-lan#1 lan#1	BB#00-LAN#0 BB#00-LAN#1 Take-over IP addresses of BB#00- LAN#0 and BB#01-LAN#0 BB#01-LAN#0 BB#01-LAN#1 Take-over IP addresses of BB#00- LAN#1 and BB#01-LAN#1		
	• For SPARC M10-1/M10-4			
	bb#00-lan#0 lan#0 bb#00-lan#1 lan#0	BB#00-LAN#0 Abbreviation of BB#00-LAN#0 BB#00-LAN#1 Abbreviation of BB#00-LAN#1		

#### EXTENDED DESCRIPTION

- The take-over IP address means IP addresses which can be used without switch of XSCF recognized in multi-XSCF configuration. Setting each LAN port of the master XSCF to lan#0 or lan#1 enables access by the name of lan#0 or lan#1.
- For SPARC M10-1/M10-4, lan#0 and lan#1 are fixed to bb#00-lan#0 and bb#00-lan#1, respectively. lan#0 and lan#1 can be used as abbreviations of bb#00-lan#0 and bb#00-lan#1, respectively.
- In the following cases, setnetwork causes an error.
  - Case that the same IP address as an set IP address is specified
  - Case that a loopback address (127.0.0.0/8), network address, or broadcast address is specified for the IP address of *interface*
  - Case that the netmask specified by -m *addr* does not correspond to either of the following

Only the most significant bit is 1.

1 from the most significant bit is repeated.

- If the settings of the network interface whose status is up are as follows in SPARC M10-4S, it causes an error when applynetwork(8) is executed.
  - Case that the subnets of xbbox#80-lan#0, xbbox#81-lan#0, and the takeover IP addresslan#0 are different
  - Case that the subnets of xbbox#80-lan#1, xbbox#81-lan#1, and the takeover IP addresslan#1 are different
  - Case that some of xbbox#80-lan#0, xbbox#80-lan#1, and the SCCP link address have the same subnet
  - Case that some of xbbox#81-lan#0, xbbox#81-lan#1, and the SCCP link address have the same subnet
  - Case that some of xbbox#80-lan#0, xbbox#81-lan#1, and the SCCP link address have the same subnet
  - Case that some of xbbox#81-lan#0, xbbox#80-lan#1, and the SCCP link address have the same subnet
  - Case that the subnets of bb#00-lan#0, bb#01-lan#0, and the take-over IP addresslan#0 are different
  - Case that the subnets of bb#00-lan#1, bb#01-lan#1, and the take-over IP addresslan#1 are different
  - Case that some of bb#00-lan#0, bb#00-lan#1, and the SCCP link address have the same subnet
  - Case that some of bb#01-lan#0, bb#01-lan#1, and the SCCP link address have the same subnet
  - Case that some of bb#00-lan#0, bb#01-lan#1, and the SCCP link address have the same subnet
  - Case that some of bb#01-lan#0, bb#00-lan#1, and the SCCP link address have the same subnet

	<ul> <li>If the settings of the network interface whose status is up are as follows in SPARC M10-1/M10-4, it causes an error when applynetwork(8) is executed.</li> </ul>
	<ul> <li>Case that the subnets of bb#00-lan#0 and bb#00-lan#1 are the same</li> </ul>
	<ul> <li>If the IP address and netmask of the specified network interface are deleted, the routing information set in the target interface is also deleted and the status becomes down.</li> </ul>
	<ul> <li>If applynetwork(8) is executed after disabling the specified network interface, the network interface is disabled even with an IP address and netmask set.</li> </ul>
	<ul> <li>You can confirm the contents of the network interface set currently by using shownetwork(8).</li> </ul>
	<ul> <li>To reflect the contents of the set network interface, execute applynetwork(8). Reflect it in XSCF by applynetwork(8), use rebootxscf(8) to reset XSCF and then setting is completed.</li> </ul>
	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.
EXAMPLES	<b>EXAMPLE 1</b> Set the IP address 192.168.10.10 and netmask 255.255.255.0 in LAN#0 of BB#00.
	XSCF> setnetwork bb#00-lan#0 -m 255.255.255.0 192.168.10.10
	<b>EXAMPLE 2</b> Set the IP address 192.168.10.10 and netmask 255.255.255.0 in LAN#0 of BB#00 in SPARC M10-1.
	XSCF> setnetwork lan#0 -m 255.255.255.0 192.168.10.10
	<b>EXAMPLE 3</b> Disable LAN#1 of XBBOX#80.
	XSCF> setnetwork xbbox#80-lan#1 -c down
	<b>EXAMPLE 4</b> Set the IP address 192.168.11.10 and netmask 255.255.255.0 in LAN#0 of XB-BOX#81.
	XSCF> setnetwork xbbox#81-lan#0 -m 255.255.255.0 192.168.11.10
	<b>EXAMPLE 5</b> Set the IP address 192.168.1.10 and netmask 255.255.255.0 in the take-over IP address of LAN#0.
	XSCF> setnetwork lan#0 -m 255.255.255.0 192.168.1.10
	<b>EXAMPLE 6</b> Delete the IP address and netmask set in LAN#0 of XBBOX#80.
	XSCF> <b>setnetwork -r xbbox#80-lan#0</b> You specified '-r' interface remove option. So, we delete routing information that interface corresponds.

	Continue? [y n] : <b>y</b> If you choose 'y'es, you must execute 'applynetwork' command for application. Or you choose 'y'es, but you don't want to apply, you execute 'rebootxscf' for reboot.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	applynetwork (8), rebootxscf (8), setroute (8), setsscp (8), shownetwork (8)

NAME	setntp - Sets the time synchronization for XSCF
SYNOPSIS	<pre>setntp -s server -c {enable disable}</pre>
	setntp [-c add] address
	setntp -c del address
	setntp -c del -a
	<pre>setntp -c stratum -i stratum_no</pre>
	<pre>setntp -s client -c {enable disable}</pre>
	<pre>setntp -s server -c {enable disable}</pre>
	setntp -m type= value
	setntp -h
DESCRIPTION	setntp is a command to set the time synchronization for XSCF.
	In setntp, the following items can be set.
	<ul> <li>Whether to synchronize with upper NTP servers</li> </ul>
	<ul> <li>Whether to provide NTP service to other clients as an NTP server</li> </ul>
	<ul> <li>stratum value set in XSCF</li> </ul>
	Existence of prefer as a client
	<ul> <li>Clock address of the XSCF local clock</li> </ul>
	By default, the XSCF is not synchronized with upper NTP servers and does not provide NTP service to other clients.
	Up to three NTP servers can be registered as upper NTP servers of the XSCF network. Attempting to register four or more causes an error. In multi-XSCF configuration, the settings are automatically reflected in the master XSCF and standby XSCFs.
Privileges	To execute this command, platadm privilege is required.
	For details on user privileges, see setprivileges(8).

# setntp(8)

OPTIONS	The following options are supported.		
	-a	Deletes all of the upper NTP servers set currently. It is used with -c del.	
	-c add	Adds to upper NTP servers. It is specified with <i>address</i> . If you omit the $-c$ option, $-c$ add is assumed specified. To register an NTP server, the existing settings are deleted and overwritten by the specified <i>address</i> .	
	-cdel	Deletes an upper NTP server. It is specified with <i>address</i> or -a. If you omit the -c option, -c add is assumed specified. When you delete multiple NTP servers, they are deleted in the order of setting.	
	-c disable	Disables the settings of XSCF as an NTP server. It is specified with the -s option. If you omit the -c option, -c add is assumed specified.	
	-c enable	Enables the settings of XSCF as an NTP server. It is specified with the -s option. If you omit the -c option, -c add is assumed specified.	
	-c strutum	Sets the stratum value in the case that XSCF is set as an NTP server. If you omit the stratum value, the default is 5.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i stratum_no	Specifies stratum value. It is used with -c stratum. You can specify an integer from 1 to 15.	

-m type=value	Sets a preferred server or the XSCF local clock. You can specify either of the following for <i>type</i> .		
	prefer	Sets whether to give top priority to the NTP server registered first at the time of synchronization.	
	localaddr	Sets the XSCF local clock.	
	If prefer is speci following in <i>value</i> .	fied in <i>type</i> , you can specify either of the	
	on	Top priority is given to the NTP server registered first. After that, priorities are placed on NTP servers in ascending order of strutum value. The default is on.	
	off	Priorities are placed on NTP servers in ascending order of strutum value regardless of the order of registering.	
	If localaddr is specified in <i>type</i> , specify the least significant byte of the clock address 127.127.1. <i>x</i> of the local clock in <i>value</i> . 0 to 3 can be specified. The default is 0 and the clock address of the local clock at that time is 127.127.1.0.		
-s server	Sets whether to use the service as an NTP server of XSCF. It is used with -c disable or -c enable. To use XSCF as an NTP server, specify -s server with -c enable. Not to use XSCF as an NTP server, specify -s server with -c disable. The default is -c disable.		
-s client	Sets whether to synchronize XSCF as an NTP client with upper NTP servers. It is used with -c disable or -c enable. To synchronize XSCF as an NTP client with upper NTP servers, specify -s client with -c enable. Not to set XSCF as an NTP client, specify -s client with -c disable. The default is -c disable. The upper NTP server to synchronize can be specified by -c add.		

OPERANDS	The following operands are supported.		
	<i>address</i> Specifies the IP address or host name of the NTP server to be added or deleted. You can specify up to three IP addresses or host names by separating them with spaces.		
		To specify them by the IP address, <i>address</i> can be specified in a format using four sets of integers separated by periods (.).	
		xxx.xxx.xxx	
		<i>xxx</i> Specifies an integer from 0 to 255. This can be specified using zero suppression.	
		To specify them by the host name, specify <i>address</i> within 64 characters in a format separating the label elements by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) Depending on the DNS server, the server name needs to be name-resolvable.	
EXTENDED DESCRIPTION	,		
	<ul> <li>If XSCF is set as a client, the time of the physical partition (PPAR) may be changed by the difference in the time kept in XSCF. Execute resetdateoffset(8) and reset the difference of the time.</li> </ul>		
	<ul> <li>You can confirm the time synchronization currently specified by using showntp(8).</li> </ul>		
EXAMPLES		ster the three NTP servers 192.168.1.2, 10.18.108.10, and 10.24.1.2 as up- ITP servers.	
		192.168.1.2 10.18.108.10 10.24.1.2 the XSCF by rebootxscf to apply the ntp settings.	
	EXAMPLE 2 Delet	e the NTP server 10.18.108.10 set as an upper NTP server.	
		-c del 10.18.108.10 The XSCF by rebootxscf to apply the ntp settings.	

I

```
EXAMPLE 3 Register the two NTP servers: ntp1.examples.com and ntp2.example.com.
                   XSCF> setntp ntpl.example.com ntp2.example.com
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
                 EXAMPLE 4 Set the stratum value used in XSCF network to 7.
                   XSCF> setntp -c stratum -i 7
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
                 EXAMPLE 5 Cancel the prefer specification of an NTP server.
                   XSCF> setntp -m prefer=off
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
                 EXAMPLE 6 Set the clock address of the XSCF local clock.
                   XSCF> setntp -m localaddr=3
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
                 EXAMPLE 7 Set XSCF to an NTP client to synchronize with upper NTP server.
                   XSCF> setntp -s client -c enable
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
                 EXAMPLE 8 Set XSCF to an NTP server to provide NTP service to other clients.
                   XSCF> setntp -s server -c enable
                   Please reset the XSCF by rebootxscf to apply the ntp settings.
EXIT STATUS
                 The following exit values are returned.
                 0
                                  Indicates normal end.
                                  Indicates error occurrence.
                 >0

setntp(8)

NAME	setpacketfilters - Sets the IP packet filtering rules used in the XSCF network.		
SYNOPSIS	<b>setpacketfilters</b> [ mask]] -j target	[-q] -{y n}] -c {a	dd   del} [-i interface] [-s address[/
	setpacketfilters [	[-q] -{y n}] -c cl	ear
	setpacketfilters -	h	
DESCRIPTION	setpacketfilte network.	ers is a command to	set the IP packet filtering rules used in XSCF
			events unauthorized access to the XSCF is executed, the setting is reflected
Privileges	To execute this co	mmand, platadm o	r fieldeng privilege is required.
	For details on use	r privileges, see set	privileges(8).
OPTIONS	The following options are supported.		
	-c {add del clear		tions for the IP packet filtering rules. You can following. This cannot be omitted.
		add del clear	Adds an IP packet filtering rule. Deletes an IP packet filtering rule. Deletes all of the set IP packet filtering rules.
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.

-i <i>interface</i> Specifies the XSCF network filtering rules. You can spe			nterface to set the IP packet y any of the following.	
	■ For SPARC M10-1/M10-4			
	bb#00-lan#0 bb#00-lan#1		BB#00-LAN#0 BB#00-LAN#1	
	Abbreviation:			
	lan#0 lan#1		bb#00-lan#0 bb#00-lan#1	
	■ For SPARC M10	)-4S (witho	ut crossbar box)	
	bb#00-lan#0 bb#00-lan#1 bb#01-lan#0 bb#01-lan#1		BB#00-LAN#0 BB#00-LAN#1 BB#01-LAN#0 BB#01-LAN#1	
	■ For SPARC M10	)-4S (with o	crossbar box)	
	xbbox#80-lan#0 xbbox#80-lan#1 xbbox#81-lan#0 xbbox#81-lan#1		XBBOX#80-LAN#0 XBBOX#80-LAN#1 XBBOX#81-LAN#0 XBBOX#81-LAN#1	
	If the -i option is omitted, all XSCF networks are subject.			
	• For SPARC M10-1/M10-4			
	bb#00-lan#0,bb#00-lan#1			
	<ul> <li>For SPARC M10-4S (without crossbar box)</li> </ul>			
	bb#00-lan#0,bb#01-lan#0,bb#00-lan#1,bb#01- lan#1			
	<ul> <li>For SPARC M10-4S (with crossbar box)</li> </ul>			
	xbbox#80-lan#0,xbbox#81-lan#0,xbbox#80-lan#1, xbbox#81-lan#1			
-j target			case that the received IP packet ou can specify either of the	
	ACCEPT DROP	Accepts p Drops IP	passing of IP packets. packets.	
-n	Automatically resp	oonds to pi	compt with "n" (no).	
-d	Prevents display o output.	f messages	, including prompt, for standard	

	-s address[/mask]		ce of IP packets. It can be specified with either or the network IP address with the netmask
			nd network IP address can be specified in a sets of integers separated by periods ( . ).
		xxx.xxx.xxx.xxx	
		xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.
			omitted, the filtering rules are applied to all of eived in the specified network interface.
		If <i>/ mask</i> is omitte	d, /255.255.255.255 is specified.
	-У	Automatically res	sponds to prompt with "y" (yes).
EXTENDED DESCRIPTION			a prompt to confirm whether to execute it with l. To execute, press the [y] key. To cancel, press
	■ The IP packet fi	iltering rules are p	rioritized in the order of setting.
	<ul> <li>Be sure to set the sources to be accepted before limiting them by filtering. Fir set the sources to be accepted and then the IP packets to be dropped. If the or of setting is reversed, all IP packets are dropped and communication become impossible.</li> </ul>		
		acket filtering rule	s may disable the network function of XSCF.
		face and -s address ts received by XSC	/ <i>mask</i> ] are omitted, the rules are applied to all F-LAN.
	<ul> <li>If the netmask v following, it can</li> </ul>		-s <i>address</i> [/ <i>mask</i> ] does not match any of the
	<ul> <li>Only the most</li> </ul>	st significant bit is	1.
	<ul><li>1 from the m</li></ul>	ost significant bit	is repeated.
		-	packet filtering rules cannot be set.
	■ Up to 16 IP pac	0	
	<ul> <li>If a message en rebootxscf(8)</li> </ul>		XSCF is output, reset XSCF by using
		n the IP packet filt packetfilters(8	ering rules of the XSCF network set currently ).

```
EXAMPLES
                 EXAMPLE 1 Drop the IP packets sent from the IP address 10.10.10.10.
                  XSCF> setpacketfilters -c add -s 10.10.10.10 -j DROP
                  -s 10.10.10.10/255.255.255.255 -j DROP
                  NOTE: applied IP packet filtering rules.
                  Continue? [y|n] :y
                 EXAMPLE 2 Accept only the IP packets sent from the network of 192.168.100.0/
                            255.255.255.0 in communication to bb#00-lan#0 in SPARC M10-4S (without
                            crossbar box).
                  XSCF> setpacketfilters -c add -s 192.168.100.0/255.255.255.0 -i
                  bb#00-lan#0 -j ACCEPT
                  -s 192.168.100.0/255.255.255.0 -i bb#00-lan#0 -j ACCEPT
                  NOTE: applied IP packet filtering rules.
                  Continue? [y|n] :y
                  XSCF>
                  XSCF> setpacketfilters -c add -i bb#00-lan#0 -j DROP
                  -s 192.168.100.0/255.255.255.0 -i bb#00-lan#0 -j ACCEPT
                  -i bb#00-lan#0 -j DROP
                  NOTE: applied IP packet filtering rules.
                  Continue? [y | n] : y
                 EXAMPLE 3 Delete the drop settings of IP packets set in IP address 10.10.10.10.
                  XSCF> showpacketfilters -a
                  -s 172.16.0.0/255.255.0.0 -i bb#00-lan#0 -j DROP
                  -s 10.10.10.10/255.255.255.255 -j DROP
                  XSCF>
                  XSCF> setpacketfilters -c del -s 10.10.10.10 -j DROP
                  -s 172.16.0.0/255.255.0.0 -i bb#00-lan#0 -j DROP
                  NOTE: applied IP packet filtering rules.
                  Continue? [y|n] :y
                 EXAMPLE 4 Delete all of the set IP packet filtering rules.
                  XSCF> setpacketfilters -c clear
                   (none)
                  NOTE: applied IP packet filtering rules.
                  Continue? [y|n] :y
EXIT STATUS
                 The following exit values are returned.
                 0
                                  Indicates normal end.
                 >0
                                  Indicates error occurrence.

NAME	setpasswordpolicy - Manages the password policy of the system.		
SYNOPSIS	<pre>setpasswordpolicy [-d dcredit][-e expiry][-i inactive] [-k difok] [-1 lcredit] [-M maxdays][-m minlen] [-n mindays] [-0 ocredit] [-r remember] [-u ucredit] [-w warn] [-y retry]</pre>		
	setpasswordpo	licy -h	
DESCRIPTION	setpasswordp	policy is a command to change the password policy of the system.	
		are executed by the XSCF on the service processor. Newly set ies are applied to the user accounts added after execution of policy.	
	parameters, are account by add	the user, the parameters, <i>expiry</i> , <i>inactive</i> , <i>maxdays</i> , <i>mindays</i> , and <i>warn</i> used as the setting of the password effective period of the new luser(8). The settings of the password effective periods of the ts can be changed by using password(8).	
Privileges	To execute this	command, useradm privilege is required.	
	For details on u	user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-a dcredit	Sets the maximum number of numbers included in a password. The minimum acceptable password length is reduced by one per a number included in the password to the value of <i>dcredit</i> . Valid values are integers from 0 to 999999999. The default value is 1. See Example 2.	
	-e expiry	Sets the number of days until the effective period of a new account expires and the account becomes invalid. When a new user account is created, this value is assigned to that user account. The default value is 0. Zero indicates that the account will not expire. Valid values are integers from 0 to 999999999.	
	-h Displays the usage. Specifying this option with another option operand causes an error.		
	-i inactive	Sets the number of days from the expiration of the password to account lock. When a new user account is created, this value is assigned to that user account. The default value is -1. If the value is -1, it indicates that the account is not locked even after the expiration of the password. Valid values are integers from -1 to 999999999.	

-k <i>difok</i>	Sets the least number of new characters (characters not included in the old password) in the new password. The default value is 3.
	Valid values are integers from 0 to 999999999.
-1 lcredit	Sets the maximum number of lower-case characters included in a password. The minimum acceptable password length is reduced by one per a lower-case character included in the password to the value of <i>lcredit</i> .
	Valid values are integers from 0 to 999999999. The default value is 1. See Example 2.
-M maxdays	Sets the maximum number of days when the password is effective. When a new user account is created, this value is assigned to that user account. The default value is 999999.
	Valid values are integers from 0 to 999999999.
-m <i>minlen</i>	Sets the minimum acceptable password length if no limit is applied to the number of characters in a password. If the limit on the number of characters is specified by the $-d$ , $-u$ , $-1$ , $-o$ option, the necessary password length is reduced when the specified character type is used.
	<b>Note</b> – A password must be composed of six or more characters regardless of the limit on the number of characters.
	Valid values are integers from 6 to 9999999999. See Example 2.
-n <i>mindays</i>	Sets the minimum number of days from a change in the password to the next change. 0 (the default value of this field) indicates that the password can be changed at any time. When a new user account is created, this value is assigned to that user account.
	Valid values are integers from 0 to 999999999.
-0 ocredit	Sets the maximum number of characters other than alphanumeric characters included in a password. The minimum acceptable password length is reduced by one per a character other than alphanumeric characters included in the password to the value of <i>ocredit</i> .
	Valid values are integers from 0 to 999999999. The default value is 1. See Example 2.

	-r remember	Sets the number of passwords to be stored in the password history.	
		The valid maximum value is 10. The default value is 3.	
		If setpasswordpolicy(8) is executed specifying 0 in <i>remember</i> , the XSCF user cannot change the password and an error message is displayed.	
	-u ucredit	Sets the maximum number of upper-case characters included in a password. The minimum acceptable password length is reduced by one per an upper-case character included in the password to the value of <i>ucredit</i> .	
		Valid values are integers from 0 to 9999999999. The default value is 1. See Example 2.	
	-w warn	Sets the default number of days until the actual expiration after the issuance of the alarm of the expiration date of the password to the user. When a new user account is created, this value is assigned to that user account. The default value is 7.	
		Valid values are integers from 0 to 999999999.	
	-у retry password	Sets the number of attempts to accept retries of a password when a password for the user account is changed using a command. The default value is 3.	
		Valid values are integers from 0 to 999999999.	
EXTENDED DESCRIPTION	You can confirm the password policy set currently by using showpasswordpolicy(8).		
EXAMPLES	<b>EXAMPLE 1</b> Set the minimum size and number of the password to be stored.		
	XSCF> setpasswordpolicy -m 12 -r 5		
	<b>EXAMPLE 2</b> Set the minimum password length and the maximum number of characters for each character type.		
	XSCF> setpasswordpolicy -m 10 -d 1 -u 0 -l 1 -o 1		
	10 characters. I characters) are number and on	command sets the minimum password length of a new password to f one or more numbers (or characters other than alphanumeric included, a password including 9 characters is accepted. If one e character other than alphanumeric characters are included, a ding 8 characters is accepted.	

EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

l

NAME		res each PCI slot setting of whether to enable the direct I/O nounted on PCI Expansion unit.	
SYNOPSIS	<b>setpciboxdio</b> [-b $bb_id$ ] -s {enable disable} [[-q] - {y n}] all		
	setpciboxdio [-b bb_id]	]-s {enable disable}[[-q]-{y n}] <i>slot_no</i>	
	setpciboxdio -h		
DESCRIPTION		mmand to configure enable/disable of the direct I/O ard mounted on the PCI Expansion unit.	
	configured settings will target PCI slot. setpci	a can be configured with each PCI slot on the server and the l be reflected to each PCI Expansion unit connected with the boxdio can be executed regardless of whether a PCI rd is mounted to the server's PCI slot.	
	This command is not su	upported on SPARC M10-1.	
Privileges	To execute this command, any of the following privileges is required.		
	platadm, fieldeng		
	For details on user priv	vileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-ъ bb_id	Specifies a BB-ID of the target server to which the direct I/O function is configured. On SPARC M10-4, only 0 can be specified for <i>bb_id</i> . On SPARC M10-4S, an integer 0-15 can be specified for <i>bb_id</i> depending on the system configuration.	
		When omitting the option, settings will be applied to the own server.	
		On SPARC M10-4, only 0 can be specified for <i>bb_id</i> .	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-d	Prevents display of messages, including prompt, for standard output.	

### setpciboxdio(8)

	-s{enable di	sable}	PCI Expansion uni	er to enable the direct I/O function via it for the specified PCI slot. Any of the an be specified. When omitting the ill be occurred.	
			enable disable	Enables the direct I/O function. Disables the direct I/O function.	
	-у		Automatically resp	ponds to prompt with "y" (yes).	
OPERANDS					
	all			l PCI slots on the specified server. This with the <i>slot_no</i> at the same time.	
	slot_no	settin Plura inser	Specifies the number of a PCI slot to be applied with the settings. An integer 0-10 can be specified in no particular order. Plural slot numbers can be specified at the same time by inserting space characters. This operand cannot be used with the all at the same time.		
EXTENDED DESCRIPTION			ot be executed to a vn server has been a	crossbar box. And, omitting -b causes a crossbar box.	
	which the tary In other cases not turned off	get serv , the co f, an err	er's physical system mmand fails with an or occurs and the se	he case where the power of a PPAR, in a board (PSB) is included, is turned off. n error. When the power of the PPAR is ettings will be reflected at the next boot.

setpciboxdio(8)

NAME	setpcl - Sets the physic	al partition (PPAR) configuration information (PCL).		
SYNOPSIS	<pre>setpcl -p ppar_id -s p</pre>	olicy= value		
	setpcl -p ppar_id -s a	ariable=value lsb [ lsb]		
	<pre>setpcl -p ppar_id -a ls</pre>	b=psb [ lsb=psb]		
	setpcl -p ppar_id -r ls	b [ lsb]		
	setpcl -h			
DESCRIPTION	setpcl is a command	to set PCL.		
	PCL is hardware resou boards (LEB) composin	rce information which can be set in PPAR or logical system g PPAR.		
		m boards recognized by Hypervisor. It is indicated by an om 00 to 15 for each PPAR.		
	hardware. setpcl lin	) means the boards recognized by XSCF and mounted as ks LSBs with PSBs by setting PCL and performs settings such mounted hardware resources on the Oracle Solaris on logical		
	In setpc1, the following information in PCL can be set. For SPARC M10-1/M10-4, only policy can be set.			
	Settings for PPAR:			
	<ul> <li>Degradation range in the case that an abnormality is detected in the initial hardware diagnosis (policy)</li> </ul>			
	However, it cannot be set while PPAR is in operation. To reset it, it is necessary to turn off the power of PPAR.			
	fru Deg	radation by part such as CPU and memory (Default)		
	psb Deg	radation by PSB		
	system Shu	down of the target PPAR without degradation		
	Settings for LSB:			
	<ul> <li>PSB number linked</li> </ul>	with LSB		
	Specifies the PSB nu	mber to be linked with LSB.		
	<ul> <li>Using memory mouth</li> </ul>	nted in LSB (no-mem)		
		to make the Oracle Solaris on the logical domain use		
	-	ounted in LSB (no-io)		

# setpcl(8)

		hether to make the Oracle Solaris on the logical domain use I/O as PCI card mounted in LSB.	
Privileges	To execute this command, platadm privilege is required.		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-a lsb=psb	Specifies the PSB number to be linked to the LSB number of PPAR. This can be specified using the following format. You cannot specify it in SPARC M10-1/M10-4.	
		lsb=psb	
		<i>lsb</i> Specifies the LSB number. You can specify an integer from 0 to 15.	
		<i>psb</i> Specifies the PSB number. This can be specified using the following format.	
		xx-y	
		<i>xx</i> : Specifies an integer from 00 to 15. <i>y</i> : Fixed to 0.	
		You can specify it in a format separating <i>lsb</i> and <i>psb</i> by equal sign (=). Do not put any space before and after "=." You can specify multiple <i>lsb=xsb</i> by separating them with spaces.	
		Specifying the same LSB number and PSB number redundantly causes an error. It also causes an error that a PSB number is set in the specified <i>lsb</i> .	
		If the specified <i>psb</i> is set in another LSB, the existing settings is deleted and overwritten on the specified <i>lsb</i> .	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-p ppar_id	Specifies the PPAR-ID to be set. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
	-r	Specifies the PSB number linked to the LSB number of the specified PPAR. You cannot specify it in SPARC M10-1/M10-4.	

I

s variable=value	Sets the hardware resources of the PSB linked to LSB. In <i>variable</i> , the items to be set are specified. In <i>value</i> , the values for <i>variable</i> are specified. Specify just one <i>variable</i> and <i>value</i> in a format separating them by equal sign (=). Do not put any spaces before and after "=."			
	You can specify any of the following for <i>variable</i> . For SPARC M10-1/M10-4, you can only set policy.			
	policy	Degradation range in the case that an abnormality is detected in the initial hardware diagnosis		
	no-mem	Whether to use memory on the logical domain		
	no-io	Whether to use I/O devices on the logical domain		
	If policy is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .			
	fru	If an abnormality is detected in the diagnosis, this degrades the target Field Replaceable Unit (FRU).		
	psb	If an abnormality occurs in the diagnosis, this degrades the target PSB.		
	system	If an abnormality occurs in the diagnosis, this shuts down the target PPAR.		
	If no-mem is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .			
	true	Prohibits using memory on the logical domain.		
	false	Allows using memory on the logical domain (Default).		
	If no-io is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .			
	true	Prohibits using I/O devices on the logical domain		
	false	Allows using I/O devices on the logical domain (Default).		

```
setpcl(8)
```

<ul> <li>PPAR configuration by deleteboard(8).</li> <li>If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.</li> <li>If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.</li> <li>You can confirm the information of PCL set currently by using showpcl(8).</li> </ul>	OPERANDS	The following operands are supported.			
DESCRIPTION       the contents set in LSB cannot be changed. Change them after releasing PSB from PPAR configuration by deleteboard(8).         If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.         If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.         If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.         You can confirm the information of PCL set currently by using showpel(8).         If policy is changed when degradation has already occurred, degradation may be different from expected one.         EXAMPLES         EXAMPLE 1       Link LSB 0 of PPAR-ID 0 to PSB 00-0, and LSB 1 to PSB 01-0.         XSCF> setpcl -p 0 -a 0=00-0 1=01-0         EXAMPLE 2       Set no-mem=true in LSB 0 and 1 of PPAR-ID 0.         XSCF> setpcl -p 0 -s no-mem=true 0 1         EXAMPLE 3       Set policy=system         EXAMPLE 4       Delete the PSBs linked to LSB 0 and 1 of PPAR-ID 0.         XSCF> setpcl -p 0 -r 0 1       XSCF> setpcl -p 0 -r 0 1         EXIT STATUS       The following exit values are returned.       0         0       Indicates normal end.       >0         >0       Indicates error occurrence.       SEE ALSO		from 00 to 15 for <i>lsb</i> . You can make multiple specifications by separating them with spaces. Specify a unique value in PPAR for <i>lsb</i> . Specifying the same <i>lsb</i> causes an error. You cannot specify it			
Change it after shutdown of the specified PPAR.         If the specified PPAR is in operation, the value of policy cannot be changed. Change it after shutdown of the specified PPAR.         You can confirm the information of PCL set currently by using showpcl(8).         If policy is changed when degradation has already occurred, degradation may be different from expected one.         EXAMPLES         EXAMPLE 1         Link LSB 0 of PPAR-ID 0 to PSB 00-0, and LSB 1 to PSB 01-0.         XSCF> setpcl -p 0 -a 0=00-0 1=01-0         EXAMPLE 2         Set no-mem=true in LSB 0 and 1 of PPAR-ID 0.         XSCF> setpcl -p 0 -s no-mem=true 0 1         EXAMPLE 3         Set policy=system in PPAR-ID 0. NAME	setpowercapping - Sets limitations for power consumption.					
SYNOPSIS	<b>setpowercapping</b> [ [-q] - {y n}] -s option= value [ [-s option= value]]					
	<pre>setpowercapping [[-q] -{y n}] -c default</pre>					
	setpowercapping -h					
DESCRIPTION	setpowercapping is a command to set limitations for power consumption of the system. All settings are reflected immediately.					
	All of the settings will be applied immediately after the command execution.					
	The settable items are below.					
	<ul> <li>Whether to enable/disable the power consumption limiting function</li> </ul>					
	Sets whether to enable/disable the power consumption limiting of the system. The default is off (disable).					
	<ul> <li>Upper limit of power consumption</li> </ul>					
	Sets the upper limit of power consumption. You can specify wattage or percent. The default is 100 (%) by percent specification.					
	<ul> <li>Upper limit of power consumption (Wattage specification)</li> </ul>					
	Sets the upper limit of power consumption by wattage.					
	<ul> <li>Upper limit of power consumption (Percent specification)</li> </ul>					
	Sets the upper limit of power consumption by percentage.					
	Converts the minimum power consumption value (0%) and maximum power consumption value (100%) of the system to the upper limit power value (watt).					
	<ul> <li>Window time in the case that the upper limit is exceeded</li> </ul>					
	If the power consumption value of the system continues to exceed the upper limit of power consumption continuously, set the window time until it is judged as violation. The unit is second and the default is 30.					
	<ul> <li>System operation at the time of violation</li> </ul>					
	Sets the system operation if the window time elapses with the power consumption value of the system exceeding the upper limit of power consumption. You can specify any of none, shutdown, and poff. The default is none.					
	The maximum power supply of the power supply unit (PSU), and the minimum and the maximum power consumption of the system can be confirmed by using the showenvironment(8).					
Privileges	To execute this command, platadm or fieldeng privilege is required.					
	For details on user privileges, see setprivileges(8).					

#### setpowercapping(8)

OPTIONS	The following options are supported.				
	-c default	Initializes the entire power co	onsumption limiting function.		
	-h	Displays the usage. Specifyin or operand causes an error.	ng this option with another option		
	-n	Automatically responds to pr	rompt with "n" (no).		
	-đ	Prevents display of messages output.	Prevents display of messages, including prompt, for standard output.		
	-s option=value	option are specified. Specify a	n (=). Do not put any spaces before multiple specifications by		
		You can specify any of the fo	llowing for option.		
		activate_state	Sets whether to limit power consumption.		
		powerlimit_p	Sets the upper limit of power consumption by percentage (%). You cannot specify this with powerlimit_w.		
		powerlimit_w	Sets the upper limit of power consumption by wattage. You cannot specify this with powerlimit_p.		
		timelimit	Sets the window time in the case that power consumption exceeds the upper limit.		
		violation_actions	Sets the system operation when the window time elapsed with the upper limit exceeded.		

		If activate_stat of the following in	te is specified in <i>option</i> , you can specify either <i>value</i> .
		enabled disabled	Limits power consumption. Does not limit power consumption (default).
		integer from 0 to 1 larger than the max	is specified in <i>option</i> , you can specify an 00 for <i>value</i> . You can specify a value which is ximum power consumption of the system, but alue which is less than the minimum power e system.
		If powerlimit_w integer from 0 to 9	is specified in <i>option,</i> you can specify an 9999 for <i>value</i> .
		from 10 to 99999 fo	becified in <i>option,</i> you can specify an integer or <i>value</i> . The unit is second. Any of the lso can be specified.
		default	Sets the grace period for exceeding the upper limit of power consumption to 30 seconds.
		none	Sets the grace period for exceeding the upper limit of power consumption to 0 second.
		If violation_act either of the follow	tions is specified in <i>option</i> , you can specify ving in <i>value</i> .
		none	Outputs only the message for exceeding the upper limit (Default).
		shutdown	Shuts down the physical partition (PPAR) below the upper limit after outputting the message for exceeding the upper limit.
		poff	Forcibly shuts down PPAR below the upper limit after outputting the message for exceeding the upper limit.
	-у	Automatically resp	oonds to prompt with "y" (yes).
EXTENDED DESCRIPTION	<ul> <li>You can confir showpowerca</li> </ul>	0 0	ding power consumption limiting by using

setpowercapping(8)

<b>SYNOPSIS</b> setpowerschedule {-p <i>ppar_id</i>   -a} -c control={enable disable}	<pre>setpowerschedule {-p ppar_id   -a } -c control={enable disable}</pre>		
<pre>setpowerschedule {-p ppar_id   -a } -c recover={on   off   auto}</pre>			
setpowerschedule -h			
<b>DESCRIPTION</b> setpowerschedule is a command to set information related to schedule operation.			
Schedule operation can be set for the entire physical partitions (PPAR) or e PPAR.	ach		
<b>Privileges</b> To execute this command, either of the following privileges is required.			
platadm Enables execution for all PPARs.			
pparadm Enables execution for PPARs for which you have administration privilege.			
For details on user privileges, see setprivileges(8).			
<b>OPTIONS</b> The following options are supported.			
-a	-a		
Sets for all PPARs.			
-c control={enable disable}			
	Enables/Disables schedule operation of the specified PPAR. To enable it, specify enable. To disabled it, specify disable. The default is off (disable).		
-crecover={on off auto}			

	Sets whether to turn on the power at the time of resumption of power. Yo can specify any of the following.	
	on	Turns on the power and restores the same power supply status as before a power failure (Default).
	off	Does not turn on the power.
	auto	If the time of power recovery is within the scheduled operation period (within the scheduled period from power-on to power-off), power is turned on. If it is outside of the scheduled operation period, power is not turned on. If either power-on or power-off is not scheduled, it is regarded as outside of the scheduled operation period and power is not turned on.
		Example 1: If it is scheduled to power on at 9 and to power off at 13 - If power recovered at 10: power will be turned on
		- If power recovered at 15: power will not turned on
		Example 2: If it is scheduled to power on at 9 but has no
		power-off schedule - If power recovered at 10 or at 15: power will not be
		turned on in either case
	-h	
	Displays the usa causes an error.	ge. Specifying this option with another option or operand
	-p ppar_id	
		AR-ID to set schedule operation. Depending on the system ou can specify an integer from 0 to 15 for <i>ppar_id</i> .
OPERANDS	The following operands are supported. <pre>timeout=offtimeout</pre>	
	forceoff=enab	vn wait time of Oracle Solaris, in the case of -c ole. It specifies the wait time for <i>offtimeout</i> . You can specify 0 to 255 by minutes. The default is 10 (minutes).
EXTENDED DESCRIPTION	<ul> <li>In the uninterruptible power system (UPS) connection configuration, the schedule setting link function of the Power Chute Network Shutdown Enterpri (PCNS) is a different function from schedule setting by setpowerschedule. Sets only one of these functions for schedule. If both of them are set, the schedule setting link function of PCNS cannot be suspended by disablin the schedule operation set by setpowerschedule or suspending schedule operation (holiday setting).</li> </ul>	

	<ul> <li>You can confirm the schedule operation information set currently by using showpowerschedule(8).</li> </ul>		
	<ul> <li>Specifying a non-existent PPAR-ID or invalid option or parameter causes an error.</li> </ul>		
	<ul> <li>When you changed the configuration of the logical domain, execute the ldm add-spconfig on the control domain, to store the latest configuration information in XSCF. If you do not store the information, the automatic power off processing may fail to work properly.</li> </ul>		
EXAMPLES	<b>EXAMPLE 1</b> Enable the schedule operation of PPAR-ID 1.		
	XSCF> setpowerschedule -p 1 -c control=enable XSCF>		
	<b>EXAMPLE 2</b> Set so that the power of PPAR-ID 1 can be turned on according to schedule operation at the time of resumption of power.

setpowerschedule(8)

NAME	setpowerupdelay - Sets the warm-up operation time of the system and the wait time before start.	
SYNOPSIS	setpowerupdelay -p ppar_id -c warmup -s time	
	setpowerupdelay -a -c warmup -s time	
	setpowerupdel	<b>ay</b> -c wait -s <i>time</i>
	setpowerupdel	ay -h
DESCRIPTION	<ul> <li>Setpowerupdelay is a command to set the warm-up operation time of the system and the wait time before start.</li> <li>The wait time before start can be used for control such as starting the system after waiting for the temperature to become appropriate by air conditioning in the data center. If the input power of the system has already been turned on and the system is in operation, the set contents will be enabled next time when the system is started.</li> </ul>	
	The warm-up o	pperation wait time is set for each physical partition (PPAR).
Privileges	To execute this command, platadm or fieldeng privilege is required.	
	For details on u	user privileges, see setprivileges(8).
OPTIONS	The following options are supported.	
	-a	Sets a warm-up operation time for all PPARs.
	-c warmup	Sets the warm-up operation time.
	-cwait	Sets the wait time before the system is started.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-p ppar_id	Specifies the PPAR to set the warm-up operation time.
	-s time	Specifies the warm-up operation time or the wait time before start by minutes. You can specify an integer from 0 to 255 for <i>time</i> .
EXTENDED DESCRIPTION	<ul> <li>You can confirm the warm-up operation time and wait time before start set currently by using showpowerupdelay(8).</li> </ul>	
		is turned on by using testsb(8), the warm-up operation time and fore start are ignored. To monitor these times at start, use

# setpowerupdelay(8)

EXAMPLES	<b>EXAMPLE 1</b> Set the warm-up operation time to 10 minutes.
	XSCF> setpowerupdelay -p 00 -c warmup -s 10
	<b>EXAMPLE 2</b> Set the wait time before start to 20 minutes.
	XSCF> setpowerupdelay -c wait -s 20
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>poweron(8), showpowerupdelay(8), testsb(8)</pre>

NAME	setpparmode - Sets the operation mode of the physical partition (PPAR).	
SYNOPSIS	setpparmode [[-q] - {y n}] -p ppar_id -m function=mode	
	setpparmode -h	
DESCRIPTION	setpparmode is a command to set the operation mode of PPAR.	
	The type of the operation modes of PPAR are below.	
	Diagnosis level	Diagnosis level of Power-On Self-Test (POST). Set this while PPAR is not in operation. The default is standard. When the command is executed, the setting is reflected immediately.
	Message level	Detailed level of the console message of the POST diagnosis. Set this while PPAR is not in operation. The default is standard. When the command is executed, the setting is reflected immediately.
	Alive Check (the monitoring between XSCF and Hypervisor)	Whether to enable or disable Alive Check. The default is on (enable). To reflect the setting, PPAR must be powered on or reset.
	Operation after the Host Watchdog (the monitoring between Hypervisor and the control domain) timeout	Operation of PPAR at the time of Host Watchdog timeout. By default, PPAR is reset. When the command is executed, the setting is reflected immediately.
	Break signal (STOP-A) control	Whether to enable or disable break signal transmission control. The default is on (enable). When the command is executed, the setting is reflected immediately.
	Autoboot of the guest domain	Whether to autoboot the guest domain when PPAR is started. The default is on (enable). To reflect the setting, PPAR must be powered on or reset.
	Power-saving operation	Whether to enable or disable the low-power operation of CPU or memory. The default is off (disable). To reflect the setting, PPAR must be powered on or reset.
	I/O bus reconfiguration (ioreconfigure)	Whether to reconfigure I/O bus according to the bus configuration when PPAR is powered on or reset. The default is off (disable). Execute the command while PPAR is not stopped (in the status other than Powered Off). You cannot set it in SPARC M10-1.

# setpparmode(8)

	If any of the operation modes of PPAR is selected, the list of the current setting contents is displayed.		
Privileges	To execute this command, any of the following privileges is required.		
	<ul> <li>Diagnosis level, message level, autoboot of the guest domain</li> </ul>		
	fieldeng	Enables execution for all PPARs.	
	<ul> <li>Alive Check, operation at the time of Host Watchdog timeout, break signal, autoboot of the guest domain, power-saving operation, reconfiguration of I/O buses</li> </ul>		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	

-m *function=mode* Sets the operation mode and value. Specify the operation mode for *function*. You can specify any of the following.

### diag

Sets the diagnosis level of POST.

message

Sets the detailed level of the console message of POST diagnosis.

### alive\_check

Sets whether to enable or disable Alive Check.

### watchdog\_reaction

Sets the operation at the time of Host Watchdog timeout.

### break\_signal

Sets whether to enable or disable break signal control.

### guestboot

Sets whether to enable or disable autoboot of the guest domain.

### elastic

Sets whether to enable or disable the power-saving operation of CPU or memory.

### ioreconfigure

Sets whether to enable or disable reconfiguration of I/O buses when PPAR is started or restarted. You cannot set it in SPARC M10-1.

If diag is specified in <i>function</i> , you can specify either of the following in <i>mode</i> . Set this while PPAR is not in operation.	
off min	Does not make a diagnosis. Sets the diagnosis level to "standard" (Default).
max	Sets the diagnosis level to "Maximum."
	ified in <i>function,</i> you can specify either of the Set this while PPAR is not in operation.
none	The diagnosis output is not displayed until a failure is detected.
min	Displays the limited volume of the diagnosis output.
normal	Displays an appropriate volume of the diagnosis output (Default).
max	Displays the complete diagnosis output including the names of diagnoses performed and the results.
debug	Displays a wide diagnosis output including the debug output of each diagnosis.
If alive_check, break_signal, guestboot, or elastic is specified in <i>function</i> , you can specify either of the following for <i>mode</i> .	
on	Enables host watchdog, break signal transmission control, autoboot of the guest domain, and power-saving operation.
off	Disables host watchdog, break signal transmission control, autoboot of the guest domain, and power-saving operation.
	domani, and power-saving operation.

		If watchdog_read either of the follow	ction is specified in <i>function</i> , you can specify ving in <i>mode</i> .
		none	None.
		dumpcore	Generates panic in the logical domain where an abnormality is detected.
		reset	Resets the hardware of PPAR containing the logical domain where an abnormality is detected.
		If ioreconfigure of the following in	e is specified in <i>function</i> , you can specify either <i>a mode</i> .
		true	Every time the power of the system is turned on, XSCF confirms I/O buses and reconfigures them, if necessary.
		false	XSCF does not reconfigure I/O buses.
		nextboot	Only when the power is turned on next time, XSCF reconfigures the I/O buses. It is automatically set to false after reconfiguration.
	-n	Automatically resp	ponds to prompt with "n" (no).
	-p ppar_id		R-ID to set the operation mode. Depending on uration, you can specify an integer from 0 to 15
	-đ	Prevents display o output.	f messages, including prompt, for standard
	-У	Automatically resp	ponds to prompt with "y" (yes).
EXTENDED DESCRIPTION	the specified c the [n] key.	ontents is displayed	a prompt to confirm whether to execute it with . To execute, press the [y] key. To cancel, press
	<ul> <li>The operation but the setting</li> </ul>		armode does not display the actual operation
	The actual operation pane	eration varies accord el. If the mode switc le of PPAR is set as	ling to the status of the mode switch of the ch of the operation panel is "Service," the follows regardless of the contents set by
	the guest de	8	autoboot of the control domain, autoboot of g operation, reconfiguration of I/O buses: As

# setpparmode(8)

	<ul> <li>Alive Check and the op</li> </ul>	peration aft	er the Host Watchdog timeout: Disabled
	<ul> <li>Break signal (STOP-A) t</li> </ul>		n control: Sends a break signal regardless of
	the settings		
		ntents set	PAR operation mode set currently by using by setpparmode is displayed when executing setpparmode.

NAME	setpparparam - Foi control domain.	rcibly rewrites the OpenBoot PROM environment variables of the	
SYNOPSIS	<b>setpparparam</b> [[-q]-{y n}]-p <i>ppar_id</i> use-nvramrc		
	setpparparam [ [-o	<pre>q] - {y n}] -p ppar_id security-mode</pre>	
	setpparparam [ [-o	<pre>q] - {y n}] -p ppar_id set-defaults</pre>	
	setpparparam [ [-‹	g]-{y n}]-p ppar_id -s bootscript value	
	setpparparam [ [-‹	g]-{y n}]-p <i>ppar_id</i> -s bootscript -r	
	setpparparam -h		
DESCRIPTION	setpparparam is variables of the con	a command to rewrite the OpenBoot PROM environment ntrol domain.	
	You can set the fol	lowing OpenBoot PROM environment variables.	
	use-nvramrc?	Whether to execute the contents of NVRAM when PPAR is started or restarted	
	security-mode	Setting of the security level of the firmware	
	set-defaults	Whether to restore the OpenBoot PROM environment variables to the default	
Privileges	To execute this con	nmand, any of the following privileges is required.	
	platadm, fieldeng	Enables execution for all physical partitions (PPARs).	
		Enables execution for PPARs for which you have administration privilege.	
	For details on user	privileges, see setprivileges(8).	

OPTIONS	The following opt	ions are supported.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-p ppar_id	Specifies the PPAR-ID to rewrite the OpenBoot PROM environment variables of the control domain. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
		<b>Note</b> – Set this while PPAR is not in operation.
	-d	Prevents display of messages, including prompt, for standard output.
	-r	Deletes the set bootscript.
	-s bootscript	Forcibly rewrites the OpenBoot PROM environment variables of the control domain by using the bootscript function.
	-у	Automatically responds to prompt with "y" (yes).
OPERANDS	The following ope	erands are supported.
	use-nvramrc	Sets the environment variable use-nvramrc? to false.
	security-mode	Sets the environment variable security-mode? to none.
	set-defaults	Restores the OpenBoot PROM environment variables to the default.
	value	Sets the OpenBoot PROM environment variables of the control domain by bootscript. Enter the value enclosing it in double quotation marks ("). You can set it within 254 characters.
EXTENDED DESCRIPTION		rute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press
	by bootscrip domain set by	bot PROM environment variables of the control domain to be set t, if the OpenBoot PROM environment variables of the control another CLI is also set in <i>value</i> of -s bootscript, the value set bootscript is applicable.
	However, use- of -s bootsc:	nvramrc? and security-mode? are disabled even if set in <i>value</i> ript.
	<ul> <li>The value which start up the PP.</li> </ul>	ch is set by using the setpparparam will be cleared after you AR next time.

# EXAMPLES **EXAMPLE 1** Set the OpenBoot PROM environment variable use-nvramrc? of PPAR-ID 0 to false. XSCF> setpparparam -p 0 use-nvramrc PPAR-ID of PPARs that will be affected:0 OpenBoot PROM variable use-nvramrc will be set to false. Continue? [y|n] : **EXAMPLE 2** Set the OpenBoot PROM environment variable security-mode? of PPAR-ID 0 to none. XSCF> setpparparam -p 0 security-mode PPAR-ID of PPARs that will be affected:0 OpenBoot PROM variable security-mode will be set to none. Continue? [y|n]: **EXAMPLE 3** Initialize the OpenBoot PROM environment variables of PPAR-ID 0 to the default. XSCF> setpparparam -p 0 set-defaults PPAR-ID of PPARs that will be affected:0 All OpenBoot PROM variables will be reset to original default values. Continue? [y|n]: **EXAMPLE 4** Initialize the OpenBoot PROM environment variables of PPAR-ID 1 to the default. The message is hidden and the prompt is automatically given a "y" response. XSCF> setpparparam -q -y -p 1 set-defaults **EXAMPLE 5** Rewrite the OpenBoot PROM environment variables of PPAR-ID 0 by using bootscript. XSCF> setpparparam -p 0 -s bootscript "setenv auto-boot? true" setenv input-device virtual-console setenv output-device virtual-console" PPAR-ID of PPARs that will be affected:0 OpenBoot PROM variable bootscript will be changed. Continue? [y|n]: **EXAMPLE 6** Clear the bootscript of PPAR-ID 0. XSCF> setpparparam -p 0 -s bootscript -r PPAR-ID of PPARs that will be affected:0 OpenBoot PROM variable bootscript will be cleared. Continue? [y|n]:

# setpparparam(8)

EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>setpparmode(8), showpparparam(8)</pre>

NAME	setprivileges - Assigns the user privileges.	
SYNOPSIS	setprivileges user [privileges] [pparprivilege @ppars]	
	setprivileges -h	
DESCRIPTION	setprivileges is a command to assign the user privileges to the XSCF user account.	
	It is only the user privileges of XSCF that can be changed by setprivileges. You can assign up to 100 user accounts to one privilege. You can set multiple user privileges for a user account separating them with spaces. For the list of user privileges, see "Operand."	
	pparop, pparmgr, and pparadm privileges are the user privileges which can be specified for each physical partition (PPAR). For details, see "Operand" and Example 1.	
	If no user privilege is specified, setprivileges deletes all privilege data on XSCF of the specified user account. If the reference of the user privileges to Lightweight Directory Access Protocol (LDAP) is enabled, the privilege data of the user account is referred to in LDAP.	
	If none is assigned to the user account, no privilege is given to the target user account regardless of the contents of the privilege data in LDAP.	
Privileges	To execute this command, useradm privilege is required.	
	For details on user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.	
	-h Displays the usage. Specifying this option with another option or operand causes an error.	

OPERANDS	The following operands	are supported		
OI ERAINDS	The following operands are supported.			
	pparprivilege@ppars	parprivilege@ppars		
	Specifies pparad	m, pparmgr, or pparop privileges for one or more PPARs.		
		Specify the names of the user privileges which can be assigned to each PPAR in <i>pparprivilege</i> . It is specified with <i>@ppars</i> . You can specify any of the following.		
	pparadm	Enables all operations regarding hardware assigned to the PPARs to which privileges are assigned (assignment, assignment cancellation, power supply, etc.). It enables display of the statuses of all hardware assigned to the PPARs to which privileges are given. It enables execution of all operations regarding the PPARs to which privileges are given. It enables display of all statuses of the PPARs to which privileges are given.		
	pparmgr	Enables restarting, starting, and shutting down the PPARs to which privileges are given. It enables display of the statuses of all hardware assigned to the PPARs to which privileges are given. It enables display of all statuses of the PPARs to which privileges are given.		
	pparop	Enables display of the statuses of all hardware assigned to the PPARs which have privileges. It enables display of the statuses of all PPARs which have this privilege.		
	ppars	Specifies one or more PPARs for the appropriate value for <i>pparprivilege</i> attaching the @ sign and <i>ppars</i> descriptor. To specify PPAR, use it attaching PPAR-ID after the @ sign. Example: pparadm@3-4 If PPARs are specified by range, specify by separating the beginning and end of the PPARs included in the range by "" Example: pparadm@3-4 To specify multiple PPARs or PPAR ranges, separate them by commas (, ). Overlapping specification of PPARs causes an error. Example: pparadm@1-2,4		

# privileges

Specifies the user privileges which affect the entire system. You can specify any of the following.

	any of the following.	
	auditadm	Enables display and setting of all audit statuses and audit trails.
	auditop	Enables display of all audit statuses and audit trails.
	fieldeng	Enables all operations limited to the field engineers and service engineers.
	none	If privileges are set for the user in LDAP, no operation regarding the service processor requiring user privileges can be executed. The administrator can limit access to such operations on the service processor and PPAR by using this privilege.
	platadm	Enables execution of the settings of all XSCFs excluding the contents which can be executed by the useradm and auditadm privileges. It enables assignment of hardware to PPAR and cancellation of assignment from PPAR to hardware. It enables operations regarding the power supply of PPAR and XSCF. It enables operations regarding fail-over of XSCF units. It enables display of all statuses of platforms.
	platop	Enables display of all statuses of platforms but they cannot be changed.
	useradm	Enables creation, deletion, enabling, and disabling of user accounts. It enables changes in user passwords and password policies. It enables changes in user privileges.
	user	
	Specifies a valid	user name.
EXAMPLES		adm privilege for the user account (JSmith), and the pparadm r PPAR-ID 1 to 4 and 6.
	XSCF> setprivilege	es jsmith platadm pparadm@1-4,6,9
	<b>EXAMPLE 2</b> Delete all pr	rivileges set in the user account (JSmith).
	XSCF> setprivilege	es jsmith none
EXIT STATUS	The following exit valu	es are returned.
	0 Indica	tes normal end.
	>0 Indica	tes error occurrence.

NAME	setremotepwrmgmt - Sets the remote power management function.		
SYNOPSIS	<b>setremotepwrmgmt</b> -c config [-V] [-u user] [-X proxy [-t proxy_type]] [-y -n] configuration_file		
	setremotepwrmg	mt -c enable [-y -n]	
	setremotepwrmg	mt -c disable [-y -n]	
	setremotepwrmg	smt -h	
DESCRIPTION		igmt is a command to perform the following settings regarding the anagement function.	
	<ul> <li>Constructing t</li> </ul>	he remote power management group	
	<ul> <li>Changing the</li> </ul>	settings of the remote power management group	
	<ul> <li>Disabling the management g</li> </ul>	remote power management function of the remote power group	
	<ul> <li>Enabling the remote power management function of the remote power management group</li> </ul>		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-c config	Reads the management information file of the remote power management group and constructs or changes the settings of the remote power management group by transferring the settings to the host controller. It is used for initialization, addition, removal, and replacement of the devices whose powers are to be linked.	
	-cdisable	Disables the remote power management function of all the set remote power management groups. It is used when starting maintenance of the devices whose powers are to be linked.	
	-c enable	Enables the remote power management functions of all the set remote power management groups. Used when maintenance of the devices whose powers are to be linked is completed.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-t proxy_type	Specifies the proxy type. It is used with the -X option. You can specify any of http, socks4, and socks5. The default is http.	

_			
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry.	
	- V	Displays detailed information. This option is used to diagnose network and server problems.	
	-X proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified together, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> .	
	-У	Automatically responds to prompt with "y" (yes).	
OPERANDS	The following op	erands are supported.	
	configuration_file	Specifies the URL where the management information file of the remote power management group to use for setting exists.	
		The following types of format are supported.	
		http://server[:port]/path/file https://server[:port]/path/file	
		<pre>ftp://server[:port]/path/file</pre>	
		file:///media/usb_msd/path/file	
EXTENDED DESCRIPTION	<ul> <li>While setremotepwrmgmt is executed, do not execute setremotepwrmgmt for the same group ID.</li> </ul>		
	power manage	ower management device (host node) to be added to the remote ment group is registered to another group, delete the management using clearremotepwrmgmt(8) in advance.	
	set a network o	config, -c enable, and -c disable by setremotepwrmgmt, of the IPv4 format for all remote power management devices in the power management group and turn on the resident power.	
	format of the r	of the management information file to CSV. For details on the nanagement information file, see the <i>SPARC M10 Systems System</i> Administration Guide.	
		to create the management information file for each group. If one nformation file has multiple group IDs, it causes an error.	
	in the manager	d to access the distribution destination of the information is not set ment information file and the default user is not specified, it is ter the password when distributing the information of the remote ement group.	
		figuration of the remote power management group, execute rmgmt in the following procedure.	

	<ol> <li>Execute setremotepwrmgmt -c config and construct the remote power management group.</li> </ol>			
	2. Execute setremotepwrmgmt -c enable and enable the remote power management function of the constructed remote power management group.			
	<ul> <li>To update a constructed remote power management group, execute setremotepwrmgmt in the following procedure.</li> </ul>			
	1. Execute setremotepwrmgmt -c disable and disable the remote power management function of the constructed remote power management group to be updated.			
	2. Execute setremotepwrmgmt -c config and update the settings of the remote power management group.			
	3. Execute setremotepwrmgmt -c enable and enable the remote power management function of the updated remote power management group.			
	<ul> <li>If -c config is specified and the target remote power management group has been constructed and the remote power management function is enable, it causes an error.</li> </ul>			
	<ul> <li>If -c enable or -c disable is specified and no remote power management group is constructed, it causes an error.</li> </ul>			
	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.			
EXAMPLES	<b>EXAMPLE 1</b> Construct the remote power management group 1 reading the management information file on the FTP server.

NAME	setroute - Sets the routing information of the XSCF network interface.		
SYNOPSIS	<pre>setroute -c {add   del} -n address [-m address] [-g address] interface</pre>		
	setroute -h		
DESCRIPTION	setroute is a co interface.	ommand to set the routing information of the XSCF network	
		of the routing information can be registered per network interface. ceeds eight, it causes an error.	
Privileges	To execute this co	ommand, platadm privilege is required.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-c {add del}	Specifies the function for the routing information. You can specify either of the following. Omitting this causes an error.	
		addAdds the routing information.delDeletes the routing information.	
	-g address	Specifies the gateway address used for routing. <i>address</i> is specified in standard format using four sets of integers separated by periods (.). For example, for <i>xxx.xxx.xxx.xxx</i> , an integer from 0 to 255 is specified for each <i>xxx</i> . This can be specified using zero suppression.	
		You cannot specify a loop-back address (127.0.0.0/8), network address, or broadcast address.	

-h	Displays the usage. Specifying this option with another option or operand causes an error.		
-m <i>address</i>	Specifies the netmask to be the destination of the routing information. <i>address</i> is specified in standard format using four sets of integers separated by periods (.). For example, for $xxx.xxx.xxx$ , an integer from 0 to 255 is specified for each $xxx$ . This can be specified using zero suppression. If the netmask is specified, the network applying the netmask to the address specified by $-n$ is set as the target of routing.		
	If $-m$ option is omitted or 0.0.0.0 is specified for the netmask when the destination IP address is other than 0.0.0.0, the following netmasks are set depending on the address specified by the $-n$ option.		
	<ul> <li>If the specified address is Class A</li> <li>If the host part of the address (lower 24 bits) is 0 (Example: 20.0.0.0)</li> </ul>		
	A netmask value of 255.0.0.0 is set.		
	If the host part of the address (lower 24 bits) is other than 0 (Example: 20.18.108.10)		
	A netmask value of 255.255.255.255 is set.		
	<ul> <li>If the specified address is Class B</li> <li>If the host part of the address (lower 16 bits) is 0</li> <li>(Example: 136.18.0.0)</li> </ul>		
	A netmask value of 255.255.0.0 is set.		
	If the host part of the address (lower 16 bits) is other than 0 (Example: 136.18.108.10)		
	A netmask value of 255.255.255.255 is set.		
	<ul> <li>If the specified address is Class C</li> <li>If the host part of the address (lower 8 bits) is 0 (Example: 200.18.108.0)</li> </ul>		
	A netmask value of 255.255.255.0 is set.		
	If the host part of the address (lower 8 bits) is other than 0 (Example: 200.18.108.10)		
	A netmask value of 255.255.255.255 is set.		
	If 0.0.0.0 is specified by the $-n$ option, specify 0.0.0.0 for the $-m$ option or omit the $-m$ option.		

	-n address	information. <i>address</i> is specifi sets of integers separated by <i>xxx.xxx.xxx</i> , an integer fro This can be specified using z	om 0 to 255 is specified for each <i>xxx</i> . ero suppression. s, the default routing information is address (224.0.0.0 to
OPERANDS	The following op	perands are supported.	
	interface	Specifies the network interfact the following.	ce to be set. You can specify any of

NAME	setsmtp - Sets the Simple Mail Transfer Protocol (SMTP) service.		
SYNOPSIS	setsmtp [-v]		
	<pre>setsmtp [-s variable= value]</pre>		
	setsmtp -h		
DESCRIPTION	setsmtp is a command to set the SMTP service.		
	If this is used without specifying any options, it is required to enter the SMPT e- mail server name to be used, port name to be used for e-mail for transmission, and Reply-To address. Confirm that the e-mail address specified here is valid. If the -s option is specified, you can set up the SMTP setting value non-interactively.		
	Setting the e-mail server and port by using setsmtp enables transmission of test mail setting e-mail report by setemailreport(8).		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		

<b>OPTIONS</b>	The following options are supported.		
	-h		Displays the usage. Specifying this option with another option or operand causes an error.
	-s variable=	value	Sets SMTP. You can specify either of the following for variable.
			mailserver Specifies the IP address or server name. If a server name is specified, it is necessary to enable name-resolution.
			port Specifies the port address for reply.
			auth
			Specifies the authentication method. The valid values are below. none, pop, smtp-auth
			user
			Specifies the user name to be the authentication information for the SMP mail server.
			password Specifies the password to be the authentication information for the SMP mail server.
			replyaddress Specifies the address for reply. You can specify the address for reply in the format compliant with 3.4.1 of RFC 5322.
			popserver
			Specifies an IP address or a server name for the popserver. Server name, if specified, must be resolvable.
	-V		Displays detailed information.
EXTENDED DESCRIPTION	You can co	nfirm th	ne information of SMTP set currently by using showsmtp(8).
EXAMPLES	EXAMPLE 1	-	the mail server without specifying the authentication information in a-interactive mode.
	XSCF> setsmtp -s mailserver=10.4.1.1 -s auth=none		
	EXAMPLE 2	Set up	the authentication information in the non-interactive mode.
	XSCF> <b>se</b>	tsmtp	-s auth=pop -s user=jsmith -s password=*****

**EXAMPLE 3** Set up the SMTP authentication information in the interactive mode. XSCF> setsmtp Mail Server [10.4.1.1]: Port [25]: Authentication Mechanism [none]: smtp-auth User Name []: jsmith Password []: \*\*\*\*\*\* Reply Address [useradm@company.com]: EXIT STATUS The following exit values are returned. 0 Indicates normal end. Indicates error occurrence. >0 setemailreport(8), setnameserver(8), showsmtp(8) **SEE ALSO** 

setsmtp(8)

NAME	setsnmp - Manages the SNMP agent.		
SYNOPSIS	<pre>setsnmp enable [ mib_name]</pre>		
	<pre>setsnmp disable [ mib_name]</pre>		
	setsnmp addtrapho	st -t type -s community-string [-p trap-port] traphost	
	setsnmp remtrapho	st -t type traphost	
	<pre>setsnmp addv3traphost -u username -r authentication-protocol {-n engine_id   -i} [ -a authentication-password] [-e encryption-password] [-p trap-port] traphost</pre>		
	setsnmp remv3traphost -u username traphost		
	setsnmp enablev1v	2c read-only-community-string	
	setsnmp disablev1	v2c	
	<b>setsnmp</b> [-1 system-location] [-c system-contact] [-d system-description] [-p agent-port]		
	setsnmp default		
	setsnmp -h		
DESCRIPTION	setsnmp is a command to not only define the setting value of the SNMP agent but also enable or disable the SNMP agent.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user pr	rivileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-c system-contact	Specifies the contact of the system of the agent.	
	-d system-description	Specifies the explanation of the system of the agent.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-1 system-location	Specifies the location of the system of the agent.	
	-p agent-port	Specifies the listen port of the agent. The default is 161.	
	-s community-string	Works much like the password controlling access to the SNMP v1 and v2 agents. It is an interceptable plane text character string. addv3traphost is used to encrypt and hide the password.	

OPERANDS	The following o	The following operands are supported.				
	addtraphost		ion of the selected type of trap from the SNMP host. If <i>trap-port</i> is not specified, the default is string is required.			
		addtraphost has the following options and operands.				
		<ul> <li>-p <i>trap-port</i> Specifies the ID of trap port. The default is 162.</li> <li>-s <i>community-string</i> Works much like the password controlling access to the SNMP v1 and v2 agents. It is an interceptable plane text character string. addv3traphost is used to encrypt and hide the password.</li> <li>-t <i>type</i> Specifies the type of trap. The valid types of trap are below.</li> <li>v1 = The agent sends the SNMPv1 trap.</li> <li>v2 = The agent sends the SNMPv2 trap.</li> <li>inform = The agent sends information notification.</li> </ul>				
		addtraphost has the following operands.				
		traphost	Specifies the traphost name or the IP address.			

addv3traphost	Enables the transmission or notification of the SNMPv3 trap from the SNMP agent to the target host. It is necessary to select the authentication protocol. The valid protocols are below.			
	MD5 = Uses the MD5 algorithm for authentication.			
	SHA = Uses Secure Hash Algorithm (SHA) for authentication.			
	The encryption protocol used for all communication is Data Encryption Standard (DES). If no password option is used, it is required to enter the password. The password is read but not echoed to the screen. addv3traphost has the following options and operands.			
	<ul> <li>- a <i>authentication-password</i></li> <li>Sets the authentication password. It needs to have eight or more characters.</li> </ul>			
	-e <i>encryption-password</i> Sets the encryption password. -i			
	Requests the receiving host for acknowledgment.			
	-n <i>engine_id</i> Sets the ID of the local agent to send trap. You can specify the engine ID of the local SNMP agent, but even if not specified, this needs to match the engine ID expected by the receiving host. It needs to begin with "0x" and be composed of an even number of hex characters. If not, it causes an error.			
	-p trap-port			
	Specifies the ID of trap port. The default is 162. - r <i>authentication-protocol</i>			
	Sets the authentication protocol.			
	-u username			
	Specifies the user name. traphost			
	Specifies the traphost name or the IP address.			

default	Shuts down the SNMP agent and restores the settings of SNMP to the default. After using this operand, it is necessary to reconfigure SNMP before restarting the SNMP agent.		
	If setsnmp default is used, the SNMP agent for Sun MC is also shut down in the server where Sun MC is in operation. Though it does not affect the configuration of Sun MC, execute setsunmc(8) with the -s option to enable the SNMP agent again for Sun MC. <i>sunmc-server</i> of "setsunmc -s < <i>sunmc-</i> <i>server</i> >" is the server host name set in the past. Then, execute setsunmc enable after executing setsnmp enable. For details, see setsunmc(8).		
disable	Shuts down the SNMP agent, if used alone.		
	If it is used with the value ALL of <i>mib_name</i> of the option, the SNMP agent is shut down.		
	If it is used with other than the value ALL of <i>mib_name</i> of the option, the support for the target MIB module is deleted. If the support for another MIB module is maintained, the SNMP agent remains enabled. If the supports for both MIB modules are deleted, the SNMP agent is disabled and shut down. Just one <i>mib_name</i> can be specified at a time.		
	<i>mib_name</i> This is the name of the MIB module to be disabled. The valid MIB modules are below.		
	<ul> <li>SP_MIB = XSCF extension MIB</li> <li>ALL = All MIB modules in this list</li> </ul>		
disablev1v2c	Disables the communication of the SNMP agent using SNMPv1 or SNMPv2c. SNMP communication using these versions are not secure.		

	enable	To use it alone, enable the SNMP agent to support all MIB modules.
		If it is used with the value ALL of <i>mib_name</i> of the option, the SNMP agent supporting all MIB modules is activated.
		If it is used with other than the value ALL of <i>mib_name</i> of the option, the support for the target MIB module is added and the SNMP agent is enabled, if necessary. Just one <i>mib_name</i> can be specified at a time.
		<i>mib_name</i> This is the name of the MIB module to be enabled. The MIB modules which can be specified are below.
		<ul> <li>SP_MIB = XSCF extension MIB</li> <li>ALL = All MIB modules in this list</li> </ul>
	enablev1v2c	Enables the communication of the SNMP agent using SNMPv1 or SNMPv2c. SNMP communication using these versions are not secure. Therefore, the agent executes SNMPv3 by default. This agent is read only. The only community string requested is read only.
	remtraphost	Disables transmission of the selected type of trap from the SNMP agent to the target host. remtraphost has the following options and operands.
		-t <i>type</i> Specifies the type of trap. The valid types of trap are below.
		<ul> <li>v1 = The agent sends the SNMPv1 trap.</li> <li>v2 = The agent sends the SNMPv2 trap.</li> <li>inform = The agent sends information notification.</li> </ul>
		<i>traphost</i> Specifies the traphost name or the IP address.
	remv3traphost	Disables the transmission of the SNMPv3 trap from the SNMP agent to the target host. remv3traphost has the following options and operands.
		-u <i>username</i> Specifies the user name. <i>traphost</i> Specifies the traphost name or the IP address.
EXTENDED DESCRIPTION	You can confirm showsnmp(8).	the agent information of SNMP set currently by using

```
setsnmp(8)
```

<b>EXAMPLE 1</b> Set the system information.				
XSCF> setsnmp -l sandiego -c username@company.com -d ffl				
<b>EXAMPLE 2</b> Set the SNMPv3 trap host using the password option.				
XSCF> setsnmp addv3traphost -u jsmith -n 0x### -r SHA -a xxxxxxx -e yyyyyyy fiche				
<b>EXAMPLE 3</b> Set the SNMPv3 trap host without the password option.				
XSCF> <b>setsnmp addv3traphost -u bob -i -r SHA fiche</b> Authentication Password: Encryption Password:				
<b>EXAMPLE 4</b> Enable the SNMP agent.				
XSCF> setsnmp enable SP_MIB				
The following exit values are returned.				
0 Indicates normal end.				
>0 Indicates error occurrence.

I

NAME	setsnmpusm - Se	ets the User-based S	ecurity Model (USM) of the SNMPv3 agent.
SYNOPSIS	<pre>setsnmpusm create -a authentication_protocol [-p authentication_password] [-e encyrption_password] user</pre>		
	setsnmpusm de	lete user	
	setsnmpusm cl	one -u clone_user	user
	<b>setsnmpusm</b> pa <i>user</i>	sswd [-c{auth en	<pre>ncrypt}][-o old_password][-n new_password]</pre>
	setsnmpusm -h		
DESCRIPTION	setsnmpusm is	a command to set th	e USM of the SNMP agent.
Privileges	To execute this c	command, platadm	privilege is required.
	For details on us	ser privileges, see se	etprivileges(8).
OPTIONS	The following o	ptions are supported	ł.
	-h	Displays the usag or operand causes	e. Specifying this option with another option s an error.
OPERANDS	The following o	perands are support	ed.
	clone		comes to be recognized by the agent with the specified <i>clone_user</i> in the subsequent SNMP
		-u clone_user user	Specifies the user name to create clone. Specifies another user name to create a clone of <i>clone_user</i> .

I

create	Creates the user to be recognized by the agent with the specified settings in the subsequent SNMP communication. If it is used without specifying the -a option or -p option, the prompt to require the password is displayed and the password is read, but it is not echoed to the screen. The encryption protocol used for all SNMP communication is Data Encryption Standard (DES). In set snmpusm, the authentication protocol for SNMP communication is used. You can specify either of the MD5 algorithm or Secure Hash Algorithm (SHA).			
	user			
	Specifies the user name.			
	-a authentication_protocol			
	Specifies the authentication protocol. You can specify either of MD5 or SHA.			
	-e encryption_password			
	Specifies the encryption password. Specify 8 or more characters.			
	-p authentication_password			
	Specifies the authentication password. Specify 8 or more characters.			
delete	Makes the specified user unrecognized by the agent in the subsequent SNMP communication.			
	<i>user</i> Specifies the user name.			
passwd	Changes the password of the specified user. Either authentication password or encryption password can be changed. If the -c option is not specified, both are applicable. If the -c option is not specified, the authentication password needs to match the encryption password. If not, it causes an error. If no option is specified, the prompt to require the password is displayed. The password is read but not displayed on the screen.			
	-cauth encrypt			
	Specifies the password to be changed. For the authentication password and encryption password, specify auth and encrypt, respectively.			
	-n new_password			
	Specifies a new password. Specify 8 or more characters.			
	-0 old_password			
	Specifies an old password.			
	user			
	Specifies the user name.			

EXTENDED DESCRIPTION	You can confirm the current USM information regarding the SNMP agent set currently by using showsnmpusm(8).		
EXAMPLES	<b>EXAMPLE 1</b> Add a user specifying the password.		
	XSCF> setsnmpusm create -a SHA -p xxxxxxxx -e yyyyyyyy jsmith		
	<b>EXAMPLE 2</b> Add a user without specifying the password.		
	XSCF> <b>setsnmpusm create -a SHA bob</b> Authetication Password: Encryption Password:		
	<b>EXAMPLE 3</b> Create a clone of the user.		
	XSCF> <b>setsnmpusm clone -u sue joe</b> Authentication Password: Encryption Password:		
	EXAMPLE 4 Delete a user.		
	XSCF> setsnmpusm delete joe		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	setsnmpvacm - Sets the View-based Access Control Model (VACM) settings of the SNMPv3 agent.			
SYNOPSIS	setsnmpvacm creategroup -u username groupname			
	setsnmpvacm de	eletegroup -u <i>us</i>	ername gro	ирпате
	setsnmpvacm cr	ceateview -s OID	D_subtree [·	-e][-m OID_Mask] viewname
	setsnmpvacm de	eleteview-s OID	_subtree vi	ewname
	setsnmpvacm cr	reateaccess -r n	ead_viewnai	ne groupname
	setsnmpvacm de	eleteaccess grou	рпате	
	setsnmpvacm -h	1		
DESCRIPTION	setsnmpvacm is	a command to set	the VACM	of the SNMP agent.
	To execute this c	ommand, the basic	knowledge	of SNMP is required.
Privileges	To execute this c	ommand, platadm	privilege i	s required.
	For details on us	er privileges, see se	etprivile	eges(8).
OPTIONS	The following op	otions are supported	1.	
	-h	Displays the usag or operand causes		ng this option with another option
OPERANDS	The following op	perands are support	ed.	
	createaccess	Sets access to the 1	MIB view o	of the specified group.
		-r read_viewname groupname		Specifies the SNMP agent view. Specifies a valid group name.
	creategroup	Sets up the view a	access of the	e group of the specified user.
		-u username groupname	-	a valid user name. a valid group name.

	createview	Sets up the view of the exported MIB information regarding the SNMP agent. The view access to this agent is read only. The view is identified by the MIB OID subtree and you can limit a specific part of the subtree using the OID mask.	
		-е	Specifies the view to be excluded. The default is the view to be included.
		-m OID_Mask	Specifies a valid OID subtree mask. By default, the mask is ff (entire subtree).
		-s OID_subtree	Specifies the MIB OID subtree. In the entire MIB tree, the value begins with .1.
		viewname	Specifies a valid view name.
	deleteaccess	Deletes the access	entry.
		groupname	Specifies a valid group name.
	deletegroup	Deletes a group.	
		-u username	Specifies a valid user name.
		groupname	Specifies a valid group name.
	deleteview	Deletes a view.	
		-s OID_subtree	Specifies the MIB OID subtree. In the entire MIB tree, the value begins with .1.
		viewname	Specifies a valid view name.
EXTENDED DESCRIPTION	You can confirm the VACM information regarding the SNMP agent set currently by using showsnmpvacm(8).		
EXAMPLES	<b>EXAMPLE 1</b> Create a group of view access.		
	XSCF> setsnmpvacm creategroup -u jsmith admin		
	<b>EXAMPLE 2</b> Create a view of the entire MIB.		
	XSCF> setsnm	ovacm createview	-s .1 all_view
	EXAMPLE 3 Creat	te a view excluding t	he subtree.
	XSCF> setsnm	ovacm createview	-e -s .1.3.6.1.2.1.1 -m fe excl_view
	EXAMPLE 4 Creat	te access to the MIB v	riew.
	XSCF> setsnmpvacm createaccess -r all admin		ss -r all admin

setsnmpvacm(8)

NAME	setsscp - Assigns the IP address of the SP to SP communication protocol (SSCP).
SYNOPSIS	setsscp
	<pre>setsscp [-x xbbox_num][-n bb_num] -i address [[-m netmask] -N network_id]</pre>
	setsscp -b bb_id -i address -N network_id
	setsscp -c default
	setsscp -r -b bb_id [-N network_id]
	setsscp -h
DESCRIPTION	setsscp is a command to assign an IP address to an SSCP link.
	setsscp is designed to be used only for the purpose of the initial setting. When executing this command, do not turn on the power of the physical partition (PPAR).
	For SPARC M10-4S (without crossbar boxes), there are three networks of SSCP links as shown in the following.
	■ Network between BB#00 and each SPARC M10-4S cabinet (Network ID 0)
	<ul> <li>Network between BB#01 and each SPARC M10-4S cabinet (Network ID 1)</li> </ul>
	■ Network between BB#00 and BB#01 (Network ID 2)
	For SPARC M10-4S (with crossbar boxes), there are five networks as shown in the following.
	■ Network between XBBOX#80 and each SPARC M10-4S cabinet (Network ID 0)
	<ul> <li>Network between XBBOX#81 and each SPARC M10-4S cabinet (Network ID 1)</li> </ul>
	<ul> <li>Network between XBBOX#80 and each crossbar box (Network ID 2)</li> </ul>
	<ul> <li>Network between XBBOX#81 and each crossbar box (Network ID 3)</li> </ul>
	<ul> <li>Network between XBBOX#80 and XBBOX#81 (Network ID 4)</li> </ul>
	<b>Note</b> – To use the specified IP address after changing the IP address of SSCP after using setsscp, it is necessary to execute applynetwork(8) and rebootxscf(8). For other than SPARC M10-1/M10-4, it is also necessary to set the IP address of the SSCP link for the crossbar box or SPARC M10-4S composing the system.
	setsscp cannot be used for SPARC M10-1/M10-4.
Privileges	To execute this command, platadm or fieldeng privilege is required.
	For details on user privileges, see setprivileges(8).
I	

OPTIONS	The following options are supported.

-ь bb_id	Specifies the target BB-ID. For SPARC M10-4S (without crossbar boxes), you can specify an integer from 0 to 3. For SPARC M10-4S (with crossbar boxes), you can specify an integer from 0 to 15 as SPARC M10-4S, and 80 to 83 as crossbar box, respectively. It is specified by combination of the -i <i>address</i> and -N options or with the -r option.
-c default	Restores the entire SSCP links to the default.
-h	Displays the usage. Specifying this option with another option or operand causes an error.
-i address	Specifies the IP address by dotted decimal notation of IPv4. Specifies four sets of integers from 0 to 255 placing periods (.) between them. However, Class D and E address (224.0.0.0 to 255.255.255.255) cannot be specified. The integer can be specified using zero suppression.
	<ul> <li>To specify this with the -m <i>netmask</i>, specify the network addresses of all SSCP links in the system.</li> </ul>
	<ul> <li>To specify this with -b <i>bb_id</i>, specify the IP addresses unique to individual SPARC M10-4S or crossbar boxes in each network used in SSCP.</li> </ul>

-m <i>netmask</i>	Specifies the netmask addresses of all SSCP links in the system. It is specified with the $-i$ <i>address</i> and $-N$ options.		
	Specifies four sets of integers from 0 to 255 for netmask placing periods (.) between them. The integer can be specified using zero suppression.		
	If omitted, the following netmasks are set.		
	<ul> <li>For SPARC M10-4S (without crossbar box)</li> </ul>		
	■ If the network ID specified by -N is 0 or 1		
	A netmask value of 255.255.248 is set.		
	■ If the network ID specified by -N is 2		
	A netmask value of 255.255.255.252 is set.		
	• For SPARC M10-4S (with crossbar box)		
	• If the network ID specified by -N is 0 or 1		
	A netmask value of 255.255.255.224 is set.		
	<ul> <li>If the network ID specified by -N is 2 or 3</li> </ul>		
	A netmask value of 255.255.258 is set.		
	<ul> <li>If the network ID specified by -N is 4</li> </ul>		
	A netmask value of 255.255.255.252 is set.		
	If -N is not specified, the specified netmask is automatically divided by the above-mentioned netmasks and assigned to each network in order.		
-n bb_num	Specifies the number of SPARC M10-4S to be set. SPARC M10-4S (without crossbar box), you can specify a figure from 1 to 4. If not specified, the maximum value which can be specified is specified. For SPARC M10-4S (with crossbar box), you can specify a figure from 1 to 16. If not specified, 16 is specified.		

	-N network_id	Specifies the ID of the SSCP link network subject to setting. For <i>network_id</i> , specify a figure from 0 to 2 and 0 to 4 in the case of SPARC M10-4S (without crossbar box) and SPARC M10-4S (with crossbar box), respectively. If omitted, all networks are specified. If the -b option is specified without the -r option, it cannot be omitted.
	-r	It is used with $-b bb_id$ , and deletes the IP address of the specified SPARC M10-4S or crossbar box.
	-x xbbox_num	Specifies the number of crossbar boxes to be set. This cannot be specified for SPARC M10-4S (without crossbar box). For SPARC M10-4S (with crossbar box), you can specify 1, 2, or 4. If not specified, the maximum value which can be specified is specified.
EXTENDED DESCRIPTION		has never been executed, the default value is set as the IP address of k. The default values are below.
	■ For SPAR	C M10-4S (without crossbar box)
	- Network	: ID 0 (netmask: 255.255.255.248)
	BB#00	169.254.1.1
	BB#01	169.254.1.2
	BB#02	169.254.1.3
	BB#03	169.254.1.4
	- Network	x ID 1(netmask: 255.255.255.248)
	BB#00	169.254.1.9
	BB#01	169.254.1.10
	BB#02	169.254.1.11
	BB#03	169.254.1.12
	- Network	ID 1(netmask: 255.255.255.248)
	BB#00	169.254.1.9
	BB#01	169.254.1.10
	BB#02	169.254.1.11
	BB#03	169.254.1.12
	■ For SPAR	C M10-4S (with crossbar box)

- Network ID 0 (netmask: 255.255.255.224)		
XBBOX#80	169.254.1.1	
BB#00	169.254.1.2	
:		
BB#14	169.254.1.16	
BB#15	169.254.1.17	
- Network ID 1 (n	etmask: 255.255.255.224)	
XBBOX#81	169.254.1.33	
BB#00	169.254.1.34	
:		
BB#14	169.254.1.48	
BB#15	169.254.1.49	
- Network ID 2 (n	etmask: 255.255.255.248)	
XBBOX#80	169.254.1.65	
XBBOX#81	169.254.1.66	
XBBOX#82	169.254.1.67	
XBBOX#83	169.254.1.68	
- Network ID 3 (n	etmask: 255.255.255.248)	
XBBOX#80	169.254.1.73	
XBBOX#81	169.254.1.74	
XBBOX#82	169.254.1.75	
XBBOX#83	169.254.1.76	
- Network ID 4 (n	etmask: 255.255.255.252)	
XBBOX#80	169.254.1.81	
XBBOX#81	169.254.1.82	

• Executing setsscp with nothing specified starts the interactive mode and displays the prompt to enter the IP addresses of SSCPs in order.

- If SSCP has been set in the past, the current setting is displayed. If the displayed setting is appropriate, you can use it by pressing [Enter] key.
- The network address to be used for all SSCP links can be set by using the -i *address* and -m *netmask*. In this operation mode, the IP addresses used in each SSCP link unique to the crossbar box and SPARC M10-4S are automatically selected from the address range indicated by the network address. Assignment is performed in order from XBBOX#80. Collectively setting the network addresses used for all SSCP links requires a netmask which can retain a host part equivalent to or larger than 255.255.255.224 and 255.255.255.128 for SPARC M10-4S (without and with crossbar boxes, respectively).
- For SPARC M10-4S (without crossbar box), up to 10 IP addresses in the following configuration are used as the address space of all SSCP link networks.

Network ID	Number of IPs required for the maximum configuration	Netmask required for the maximum configuration
0	4	255.255.255.248
1	4	255.255.255.248
2	2	255.255.255.252

For SPARC M10-4S (with crossbar box), up to 44 IP addresses in the following configuration are used.

Network ID	Number of IPs required for the maximum configuration	Netmask required for the maximum configuration
0	17	255.255.255.224
1	17	255.255.255.224
2	4	255.255.255.248
3	4	255.255.255.248
4	2	255.255.255.252

To set the IP addresses of the links unique to individual crossbar boxes and SPARC M10-4S separately from all of the other SSCP address setting values, use the -b bb\_id, -N network\_id, and -i address.

- To change the setting value of netmask, it is necessary to execute the interactive mode or collective setting.
- If a value out of the range of network addresses set in advance is used for an SSCP link unique to a crossbar box or SPARC M10-4S, an error occurs.
- To add the crossbar boxes or SPARC M10-4S, it is necessary to assign the IP address of the SSCP link before executing addfru(8).
- If the assigned IP address overlaps with the IP address of another SSCP link, it causes an error of applynetwork(8).

- When deleting the IP address of the SSCP link of a crossbar box or SPARC M10-4S installed in the system, executing applynetwork(8) causes an error. applynetwork(8) determines whether the crossbar box or SPARC M10-4S to be deleted is included in the system.
- Setting a loopback address (127.0.0.0/8), broadcast address, or Class D or E address (224.0.0.0 to 255.255.255) in *address* causes an error.
- If the netmask value specified by -m addr does not match either of the following, it causes an error.
  - Only the most significant bit is 1.
  - 1 is placed in a row from the most significant bit.
- If the subnets of the SSCP network and another network overlap, the conditions in which executing applynetwork(8) causes an error are below.
  - Case that some of xbbox#80-lan#0, xbbox#80-lan#1, and the SCCP link have the same subnet
  - Case that some of xbbox#81-lan#0, xbbox#81-lan#1, and the SCCP link have the same subnet
  - Case that some of xbbox#80-lan#0, xbbox#81-lan#1, and the SCCP link have the same subnet
  - Case that some of xbbox#81-lan#0, xbbox#80-lan#1, and the SCCP link have the same subnet
  - Case that some of bb#00-lan#0, bb#00-lan#1, and the SCCP link have the same subnet
  - Case that some of bb#01-lan#0, bb#01-lan#1, and the SCCP link have the same subnet
  - Case that some of bb#00-lan#0, bb#01-lan#1, and the SCCP link have the same subnet
  - Case that some of bb#01-lan#0, bb#00-lan#1, and the SCCP link have the same subnet
- If the subnets of the IP address to be the destination of the routing information and subnet of the SSCP link are overlapping, executing applynetwork(8) causes an error.
- If the number of SPARC M10-4S or crossbar boxes under the maximum configuration quantity is set in the interactive mode, the IP addresses of the SPARC M10-4S or crossbar boxes not set, which have been set in the past, are deleted.
- If the number of SPARC M10-4S or crossbar boxes under the maximum configuration quantity is set by collective setting, the IP addresses of the SPARC M10-4S or crossbar boxes not set, which have been set in the past, are deleted.

However, if the ID of the SSCP link network is also specified, only the IP addresses of the SPARC M10-4S or crossbar boxes of the corresponding SSCP link network, which have been set in the past, are deleted.

■ When specifying -N *network\_id*, -b *bb\_id*, and -n *bb\_num*, -x *xbbox\_num* must be within the following range and otherwise it causes an error.

-N network_id	-b bb_id range	-n bb_num range	-x xbbox_num range
0	0 to 3	1 to 4	This cannot be specified.
1	0 to 3	1 to 4	This cannot be specified.
2	0 to 1	1 to 2	This cannot be specified.

• For SPARC M10-4S (without crossbar box)

# • For SPARC M10-4S (with crossbar box)

-N network_id	-b bb_id range	-n bb_num range	-x xbbox_num range
0	0 to 15, 80	1 to 16	1
1	0 to 15, 81	1 to 16	1
2	80 to 83	This cannot be specified.	2,4
3	80 to 83	This cannot be specified.	2,4
4	80 to 81	This cannot be specified.	2

#### EXAMPLES

**Note** – The IP addresses shown in the following examples are samples. To specify the IP address of SSCP, specify an IP address not used on the Local Area Network (LAN). For details on the IP address of SSCP, see SPARC M10 Systems System Operation and Administration Guide.

**EXAMPLE 1** Set the SSCP link using the interactive mode in a configuration composed of eight SPARC M10-4Ss.

#### XSCF> setsscp

```

NAME	setssh - Sets Secure Shell (SSH) service used in the XSCF network.
SYNOPSIS	setssh [ [-q] -{ $y n$ }] -c {enable disable}
	setssh -c addpubkey [-u user_name]
	setssh -c delpubkey {-a -s line} [-u user_name]
	<pre>setssh [ [-q] - {y n}] -c genhostkey [-b bits]</pre>
	setssh -h
DESCRIPTION	setssh is a command to set SSH service used in the XSCF network.
	In XSCF, only SSH2 is supported. In multi-XSCF configuration, the settings are automatically reflected in the standby XSCFs.
	The following contents can be set.
	<ul> <li>Start or halt of SSH service</li> </ul>
	<ul> <li>Generation of the host keys required for the SSH service</li> </ul>
	You can specify either of 2048 bits or 4096 bits. The size of the DSA host key is fixed to 4096 bits.
	<ul> <li>Registration of the user public key</li> </ul>
	The user public key can be registered for each user account. It is also allowed to register multiple user public keys for one user account. The maximum number of characters per user account including line feeds available for registration of user public keys is 8191.
Privileges	To execute this command, any of the following privileges is required.
	<ul> <li>Start or halt of SSH service and generation of the host key: platadm</li> </ul>
	<ul> <li>Registration or deletion of user public keys of other user accounts: useradm</li> </ul>
	<ul> <li>Registration or deletion of user public keys of user accounts which are currently logging in: No privileges are required.</li> </ul>
	For details on user privileges, see setprivileges(8).

# setssh(8)

OPTIONS	I	The following options are supported
OPTIONS		The following options are supported

	0 1			
	-a	Deletes all of the r specified with -c	egistered user public keys. It is delpubkey.	
	-ь bits		of the host key to be created. For <i>bits,</i> 148 or 4096. If omitted, it is recognized	
	-c addpubkey	Registers user pub	lic keys.	
	-cdelpubkey	Deletes user public	c keys.	
	-cgenhostkey	Generates the host	t key.	
	-c {enable disable}	Specifies the opera any of the followir	ation for SSH service. You can specify ng.	
		enable disable	Starts SSH service. Halts SSH service.	
	-h	Displays the usage option or operand	e. Specifying this option with another causes an error.	
	-n	Automatically resp	ponds to prompt with "n" (no).	
	-d	Prevents display o standard output.	f messages, including prompt, for	
	-s line	the number displa	oublic key number to be deleted. In <i>line,</i> yed when executing showssh -c d. It is specified with -c delpubkey.	
	-u user_name	public keys. It is sp delpubkey. If the	account name to register or delete user pecified with -c addpubkey or -c -u option is omitted, the user public ecount logging in currently are the	
	-у	Automatically resp	ponds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	the specified contents the [n] key.	s is displayed. To ex	pt to confirm whether to execute it with ecute, press the [y] key. To cancel, press	
	<ul> <li>Start of SSH service is reflected just after executing setssh and the service is started.</li> </ul>			
	<ul> <li>Halt of SSH service is reflected just after executing setssh. If any, the SSH sessions opened at the time of halting the service are disconnected.</li> </ul>			
		CF not by authenticat	nnot register user public keys. Connect to tion with the user public key but	

password authentication.

	<ul> <li>When you generate the host key, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, enter "y." To cancel, enter "n."</li> </ul>			
	<ul> <li>If a host key is generated when another one has already been generated, a prompt to ask whether to update it is displayed. To update, enter "y." To cancel, enter "n."</li> </ul>			
	<ul> <li>setssh can register just one user public key at a time.</li> </ul>			
	<ul> <li>Input of the user public key when executing setssh is finished by pressing [Enter] key and then [Ctrl] + [D] key (EOF).</li> </ul>			
	<ul> <li>If the XSCF units are duplexed, the settings are automatically reflected in the standby XSCFs. A failure of the standby XSCFs causes an error and then the settings are reflected only in the active XSCF.</li> </ul>			
	• You can confirm the contents of SSH service set currently by using showssh(8).			
EXAMPLES	<b>EXAMPLE 1</b> Start SSH service.			
	XSCF> <b>setssh -c enable</b> Continue? [y n] : <b>y</b>			
	<b>EXAMPLE 2</b> Start SSH service. The prompt is automatically given a "y" response.			
	XSCF> <b>setssh -y -c enable</b> Continue? [y n] :y			
	<b>EXAMPLE 3</b> Start SSH service. The message is hidden and the prompt is automatically given a "y" response.

SEE ALSO	showtelnet (8)		

NAME	settimezone - Sets the time zone and summer time of XSCF.		
SYNOPSIS	settimezone -c settz -s timezone		
	settimezone -c settz -a [-M]		
	<b>settimezone</b> -c a [ /time]	adddst -b std -o offset -d dst [-p offset] -f date [/time] -t date	
	settimezone -c c	deldst -b std -o offset	
	settimezone -h		
DESCRIPTION	settimezone is	a command to set the time zone and summer time of XSCF.	
	The time zone pr	repared as standard complies with the POSIX standard.	
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the list of the settable time zones. It is specified with -c settz.	
	-b std	Specifies the abbreviation of the standard time of the time zone. <i>std</i> is specified in alphabet from 3 to 7 characters. This can be specified in a format compliant with RFC2822. It is specified with -c adddst or -c deldst.	
	-c adddst	Manually sets the time zone and summer time. The summer time is set based on the time zone information specified by the -b, -o, -d, -p, -f, and -t options. If the summer time is set manually, the time zone information set by -c settz is ignored. Logging in XSCF again after executing settimezone reflects the contents of the settings.	
	-c deldst	Deletes the time zone and summer time set manually. If the summer time set manually is deleted, XSCF comes to operate in the time zone set by -c settz. Logging in XSCF again after executing settimezone reflects the contents of the settings.	
	-c settz	Sets a time zone compliant with the POSIX standard. The time zone is reflected just after executing settimezone.	
	-d dst	Specifies the summer time zone name. <i>dst</i> is specified in alphabet from 3 to 7 characters. This can be specified in a format compliant with RFC2822. It is specified with -c adddst.	

-£ date [/time]	-c adddst. It is s	time of the summer time. It is specified with specified in the same format as that of <i>date</i> of a be specified in any of the following formats.
	Jn	
	specify a figure <i>n</i> . In leap years	e date to start the summer time. You can from 1 to 365 with January 1 regarded as 1 for , February 29 is not counted. 365 indicates yen in leap years.
	specify a figure w: Specifies the first week and 5 figure from 1 to d: Specifies the	day of the week to start the summer time. 0 y and 6 indicates Saturday. You can specify a
		date to start the summer time. You can specify to 365 with January 2 regarded as 1. In leap 29 is counted.
	Specifies the time following format.	for <i>time</i> . This can be specified using the
	hh:mm:ss	This is specified in the format of "hh:mm:ss." <i>hh</i> is from 0 to 23. <i>mm</i> is 0 to 59. ss is 0 to 59. If omitted, it is 02:00:00.
-h	Displays the usage or operand causes	e. Specifying this option with another option an error.
– M	Displays text one s	screen at a time.

-0 offset	Time (GMT). It i	set between the time zone and Greenwich Mean s specified with -c adddst or -c deldst. <i>offset</i> using the following format.
	$GMT\{+   -\}hh[:mm]$	ı[:ss]]
	GMT {+   - } hh[:mm[:ss]]	Greenwich Mean Time To set a standard time earlier than GMT, specify (To set a local time on the east of Greenwich, the value of offset shall be - (minus). ) To set a standard time later than GMT, specify +. (To set a local time on the west of Greenwich, the value of offset shall be + (plus).) Specifies the offset time. <i>hh</i> is from 0 to 23. <i>mm</i> and <i>ss</i> are from 0 to 59.
-p offset	Mean Time (GM becomes one ho	set between the summer time and Greenwich (T). It is specified with -c adddst. If omitted, it ur earlier than the offset time specified by -o h be specified using the following format.
	$GMT\{+   -\}hh[:mm]$	ı[:ss]]
	GMT {+   -}	Greenwich Mean Time To set a standard time earlier than GMT, specify (To set a local time on the east of Greenwich, the value of offset shall be - (minus). ) To set a standard time later than GMT, specify +. (To set a local time on the west of Greenwich, the value of offset shall be + (plus).)
	hh[:mm[:ss]]	Specifies the offset time. <i>hh</i> is from 0 to 23. <i>mm</i> and <i>ss</i> are from 0 to 59.
-s timezone		ne zone. It is specified with -c settz. For n specify any of the time zones displayed by the

	-t date [/time]	-t adddst. It is	to finish the summer time. It is specified with specified in the same format as that of <i>date</i> of n be specified in any of the following formats.
		Jn	
		specify a figure <i>n</i> . In leap years	e date to finish the summer time. You can from 1 to 365 with January 1 regarded as 1 for , February 29 is not counted. 365 indicates yen in leap years.
		specify a figure w: Specifies the the first week a figure from 1 to d: Specifies the	day of the week to finish the summer time. 0 ay and 6 indicates Saturday. You can specify a
		specify a figure	date to finish the summer time. You can from 1 to 365 with January 2 regarded as 1. In ruary 29 is counted.
		Specifies the time following format.	for <i>time</i> . This can be specified using the
		hh:mm:ss	This is specified in the format of "hh:mm:ss." <i>hh</i> is from 0 to 23. <i>mm</i> is 0 to 59. <i>ss</i> is 0 to 60. If omitted, it is 02:00:00.
EXTENDED DESCRIPTION		e the summer time	umber of years for the time zone or summer every year, it is necessary to specify it again by
	■ If the summer	time is not set, it is	not affected by the time zone.
	<ul> <li>To set the sum format.</li> </ul>	mer time by "-c a	dddst," specify the start and end in the same
	<ul> <li>When setting t</li> </ul>	he summer time by	-c adddst, the following cases cause an error.
	<ul> <li>Case that th n format</li> </ul>	e period between th	the start and end is shorter than 14 days in $Jn$ or
		e start and end is in eeks in the Mm.w.d	n the same month and the period is shorter format
	<ul> <li>Case that an</li> </ul>	n offset smaller thar	n -p offset is specified in -0 offset

```
• Case that the difference in the offsets of -o offset and -p offset is longer than 24
                     hours

    If the standard time set by settimezone is added to the offset time, it becomes

                  GMT.
               • You can confirm the time zone set currently by using showtimezone(8).
               • To reflect the summer time information changed by the -c adddst and -c
                  deldst options, logout from XSCF and login again.
EXAMPLES
                          Set the time zone to "Asia/Tokyo."
               EXAMPLE 1
                 XSCF> settimezone -c settz -s Asia/Tokyo
                 Asia/Tokyo
               EXAMPLE 2 Display the list of the settable time zones.
                 XSCF> settimezone -c settz -a
                 Africa/Abidjan
                 Africa/Accra
                 Africa/Addis Ababa
                 Africa/Algiers
                 Africa/Asmara
                 Africa/Asmera
                 Africa/Bamako
                 Africa/Banqui
               EXAMPLE 3 Set the summer time information with setting the time zone abbreviation to
                           JST, offset from GMT to +9, summer time zone name to JDT, summer time to
                           one hour earlier, and period to 2:00 on the last Sunday of March (JST) to 2:00
                           on the last Sunday of October (JDT).
                 XSCF> settimezone -c adddst -b JST -o GMT-9 -d JDT -f M3.5.0 -t
                 M10.5.0
                 JST-9JDT,M3.5.0,M10.5.0
               EXAMPLE 4 Set the summer time information with setting the time zone abbreviation to
                           JST, offset from GMT to +9, summer time zone name to JDT, offset from the
                           summer time of GMT to +10 hours, and period to 0:00 on the first Sunday of
                           April (JST) to 0:00 on the first Sunday of September (JDT).
                 XSCF> settimezone -c adddst -b JST -o GMT-9 -d JDT -p GMT-10 -f
                 M4.1.0/00:00:00 -t M9.1.0/00:00:00
                 JST-9JDT-10,M4.1.0/00:00:00,M9.1.0/00:00:00
               EXAMPLE 5 Delete the summer time information set currently.
                 XSCF> settimezone -c deldst -b JST -o GMT-9
```

# setupfru(8)

NAME	setupfru - Sets the h	ardware of devices.
SYNOPSIS	setupfru [-m {y n}]	device location
	setupfru -h	
DESCRIPTION	setupfru is a command to set the hardware of the specified device.	
	You can specify a sy	stem board (PSB) as the device.
	The following contents can be set for PSB to make PSB available for the system after addition.	
	Memory mirror mod	e The mirror mode is the mode to divide the memory mounted in PSB into two and mirror the data. Since memory is divided into two, the memory size becomes half but it improves the reliability of data. It specifies whether to set the mode of memory to the mirror mode.
Privileges	To execute this command, platadm or fieldeng privilege is required.	
	For details on user p	vrivileges, see setprivileges(8).
OPTIONS	The following option	ns are supported.
		isplays the usage. Specifying this option with another option operand causes an error.
	th	becifies whether to set the mode of memory mounted in PSB to e mirror mode. To set it to the mirror mode, specify y. Not to t it to the mirror mode, specify n. If the -m option is omitted, e previous setting is taken over.
	u	sb is specified in <i>device</i> , the setting is reflected in all CPUs nder the specified PSB. If cpu is specified in <i>device</i> , the setting reflected only in the specified CPUs.
I		

# setupfru(8)

OPERANDS	The following o	perands are support	ed.
	device	Specifies the device following.	ce to be set. You can specify either of the
		sb	PSB
		сри	CPU in PSB
	location	Specifies the locat	ion where the device is mounted.
		sb is specified in	the following format.
		xx-y xx y	Specify an integer from 00 to 15 for it. It is fixed to 0.
		cpu is specified ir	the following format.
		xx-y-z xx y z	Specify an integer from 00 to 15 for it. It is fixed to 0. Specify an integer from 0 to 3 for it.
EXTENDED DESCRIPTION	You can confirm using showfru(		ing the hardware of the devices set currently by
EXAMPLES	<b>EXAMPLE 1</b> Set the modes of all CPUs under PSB 01-0 to the memory mirror mode.		
	XSCF> setupf	ru -m y sb 01-0	
	EXAMPLE 2 Set t	he mode of the CPU o	f PSB 02-0 CPU chip 1 to the memory mirror mode.
	XSCF> setupf	ru -m y cpu 02-0	-1
EXIT STATUS	The following ex	xit values are return	ed.
	0	Indicates normal	end.
	>0	Indicates error oc	currence.

NAME	showaltitude - Displays the altitude of the system.
SYNOPSIS	showaltitude
	showaltitude -h
DESCRIPTION	showaltitude is a command to display the altitude of the system set currently.
	If showaltitude is executed without specifying the option, the altitude of the device is displayed. The displayed altitude is the value set by setaltitude(8).
	The altitude is displayed by 100 meters (m).
Privileges	To execute this command, platadm or fieldeng privilege is required.
	For details on user privileges, see setprivileges(8).
<b>OPTIONS</b>	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	You can set the altitude of the system by using setaltitude(8).
EXAMPLES	<b>EXAMPLE 1</b> Display the altitude of the system.
EXAMPLES	EXAMPLE 1 Display the altitude of the system. XSCF> showaltitude 1000m
EXAMPLES EXIT STATUS	XSCF> showaltitude
	XSCF> <b>showaltitude</b> 1000m
	XSCF> <b>showaltitude</b> 1000m The following exit values are returned.
	<pre>XSCF&gt; showaltitude 1000m The following exit values are returned. 0 Indicates normal end.</pre>
EXIT STATUS	XSCF> showaltitude         1000m         The following exit values are returned.         0       Indicates normal end.         >0       Indicates error occurrence.

showaltitude(8)

NAME	showaudit - Displays the current status of the audit system.
SYNOPSIS	showaudit
	showaudit [all]
	<pre>showaudit [-a users] [-c { classes   all}] [-e { events   all}] [-g] [-m] [-p] [-s] [-t]</pre>
	showaudit -h
DESCRIPTION	showaudit displays the current status of the system audit. If showaudit is executed without specifying the option, it is displayed whether writing of audit records is enabled or disabled.
Privileges	To execute this command, auditadm or auditop privilege is required.
	For details on user privileges, see setprivileges(8).

OPTIONS	The following options are supported.					
	-a users	Displays the audit record generation policy of the specified user. <i>users</i> is the comma-separated list of the valid user names.				
	-c classes	Displays the audit record generation policy of the specified audit class. <i>classes</i> is a comma-separated list of audit classes. Classes can be specified with a number or name. The prefix of ACS_ can be omitted. For example, the classes of audit-related events can be expressed as ACS_AUDIT, AUDIT or 2.				
		The valid classes are below.				
		all	All classes			
		ACS_SYSTEM(1)	System-related event			
		ACS_WRITE(2)	Command that can change the status			
		ACS_READ(4)	Command to display the current status			
		ACS_LOGIN(8)	Login-related event			
		ACS_AUDIT(16)	Audit-related event			
		ACS_PPAR(32)	Physical partition (PPAR) administration-related event			
		ACS_USER(64)	User administration-related event			
		ACS_PLATFORM(128)	Platform administration-related event			
		ACS_MODES(256)	Mode-related event			
	-e events	events. <i>events</i> is a comma-sep be specified with a number o	neration policy of the specified audit arated list of audit events. Events can or name. The prefix of AEV_ can be ent of SSH login can be expressed as H, or 4.			
		For the list of valid events, se	ee showaudit -e all.			
	-g	Displays the global audit reco	ord generation policy of the user.			
	-h	Displays the usage. Specifyin operand causes an error.	ng this option with another option or			
	- m	Displays the destination add usage of the local audit area	ress of the e-mail to be sent if the reaches the threshold.			

	-p	Displays the policy to be followed if the audit trail reaches the full capacity.
	- S	Displays the following audit statuses.
		<ul> <li>Area used by the local audit record</li> </ul>
		<ul> <li>Free space left for the local audit record</li> </ul>
		<ul> <li>Number of the audit record deleted (after the previous boot) since the audit trail reaches the full capacity</li> </ul>
	-t	Displays the threshold to issue a warning for the usage of the local region.
OPERANDS	The followi	ng operands are supported.
	all	Displays the following information.
		<ul> <li>Whether writing of audit trail is set to enable or disable. This information is the same as that which is displayed when showaudit is executed without specifying any options.</li> </ul>
		<ul> <li>All information displayed when showaudit is executed specifying the -a, -c all, -e all, -g, -m, -p, -s, and -t options.</li> </ul>
EXAMPLES	EXAMPLE 1	Display the audit status.

NAME	showautologout - Displays the session timeout time of the XSCF shell.				
SYNOPSIS	showautologout				
	showautologout -h				
DESCRIPTION	showautologout is a command to display the session timeout time set in the XSCF shell.				
	Displays the session timeout time by minutes. If the session timeout time is not set by setautologout(8), it is set to 10 minutes by default.				
Privileges	To execute this command, any of the following privileges is required.				
	useradm, platadm, platop, auditadm, auditop, pparadm, pparmgr, pparop, fieldeng				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
EXAMPLES	<b>EXAMPLE 1</b> Display the session timeout time of the login shell. (If set to 30 minutes)				
	XSCF> <b>showautologout</b> 30min				
	<b>EXAMPLE 2</b> Display the session timeout time of the login shell. (In the default status)				
	XSCF> <b>showautologout</b> 10min				
EXIT STATUS	The following exit values are returned.				
	0 Indicates normal end.				
	>0 Indicates error occurrence.

NAME	showboards - Displays the information of the system board (PSB).					
SYNOPSIS	showboards [-v] -a [-c sp]					
	showboards [-v] -p ppar_id [-c sp]					
	showboards [-v] psb					
	showboards -h showboards is a command to display the information of PSB.					
DESCRIPTION						
	Displays the information of all PSBs currently incorporated into, assigned to, or mounted in the physical partition (PPAR). If PPAR is specified, only the informatic defined in the PPAR configuration information (PCL) is displayed.					
	The following in	formation is display	red.			
	PSB	PSB number				
		This is displayed	in the format below.			
		xx-y: xx Y	Integer from 00 to 15 It is fixed to 0			
	PPAR-ID	PPAR-ID				
		Any of the follow:	ing is displayed.			
		00-15 SP	PPAR-ID to which PSB is assigned PSB does not belong to PPAR and is in the system board pool status			
		Other	This is displayed if the PSB is set in the PCL of a PPAR to which access privilege has been granted, and at the same time, belongs to a PPAR to which no access privilege has been granted.			
	LSB	Logical System Bo	bard (LSB) number defined in PPAR			
		An integer from 0	0 to 15 is displayed.			

Assignment	Assignment status of PSB to PPAR		
	Any of the following is displayed.		
	Unavailable	PSB is in the system board pool status (not assigned to PPAR) and corresponds to any of "Undiagnosed," "Diagnosing," or "Abnormal diagnosis." Unimplemented PSB also becomes Unavailable.	
	Available	PSB is in the system board pool status and the diagnosis has been normally completed.	
	Assigned	PSB is assigned to PPAR.	
Pwr	PSB is turned on		
	Either of the follow	ving is displayed.	
	n Y	In the power-off status In the power-on status	
Conn	PSB is connected t	o the PPAR configuration	
	Either of the follow	ving is displayed.	
	n	Not connected to the corresponding PPAR or in the system board pool status	
	У	Connected to the corresponding PPAR	

	Conf	Operating st	atus of Oracle Solaris		
	00112	Either of the following is displayed.			
		n y	PSB is not operating in Oracle Solaris. PSB is operating in Oracle Solaris.		
	Test	-	initial diagnosis of PSB		
			ollowing is displayed.		
		Unmount Unknown Testing Passed Failed	Recognition is impossible because it is not mounted or a failure occurred Not diagnosed The initial diagnosis is in progress. The initial diagnosis is normally completed. An abnormality occurred in the initial diagnosis. PSB cannot be used or are degraded.		
	Fault	Degradation	status of PSB		
		Any of the fo	ollowing is displayed.		
		Normal	Normal status		
		Degraded	There is a degraded part. PSB can be operated.		
		Faulted	An abnormality occurred and PSB cannot operate.		
	If it is specified v detailed status of		tion, the following information is displayed as the		
	R	Dynamic Reo PPAR	configuration (DR) reservation status of PSB for		
		*	DR processing is reserved. If PPAR is restarted, the PPAR configuration is changed by incorporation or release of PSB.		
Privileges	To execute this co	ommand, any	of the following privileges is required.		
	platadm, platc	p,fieldeng	Enables execution for all PPARs and PSBs.		
	pparadm, pparm	gr, pparop	Enables execution for PPARs for which you have access privilege.		

## showboards(8)

	For details on user privileges, see setprivileges(8).							
OPTIONS	The following options are supported.							
	-a	Displays the statuses of all PSBs incorporated into, assigned or mounted in PPAR.						ated into, assigned to,
	-c sp	Displays the PSB of the system board pool. System board pool means the status in which PSB does not belong to any PPARs.						
	-h	Displays the usage. Specifying this option with another option or operand causes an error.						
	-p ppar_id	Specifies the PPAR-ID to display the status. Only the information defined in the PCL of the specified PPAR is displayed. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .						
	- V	Disp	ays the det	ailed	l infor	matio	n of PSB.	
OPERANDS	The following op	The following operands are supported.						
	psb	Specifies the PSB number to be displayed. The specification format is below.					l. The specification

NAME	showcod - Displays the information of the Capacity on Demand (CoD).					
SYNOPSIS	showcod [-v]-s cpu					
	showcod [-v] -p ppar_id					
	<b>showcod</b> [-v] [-M]					
	showcod -h					
DESCRIPTION	showcod is a command to display the CoD information. The CoD information includes the numbers of the CPU core Activation which have been installed and the CPU core Activations reserved for the physical partition (PPAR) and chassis host ID. The numbers of the CPU core Activations which have been installed and the CPU core Activations assigned to PPAR are displayed for each type of resources. The types of resources are CPU.					
	If showcod is ex PPARs is displa		vithout specifying -p <i>ppar_id</i> , the CoD information of all			
Privileges	To execute this	command	d, any of the following privileges is required.			
	platadm,plat	op	Enables execution for all PPARs.			
	pparadm, ppar pparop	mgr,	Enables execution for PPARs for which you have access privilege.			
	For details on user privileges, see setprivileges(8).					
OPTIONS	The following o	ptions ar	e supported.			
	-h	Displa	ys the usage. Specifying this option with another option rand causes an error.			
	– M	Displa	ys text one screen at a time.			
	-p ppar_id	-	ies PPAR-ID. Depending on the system configuration, you ecify an integer from 0 to 15 for <i>ppar_id</i> .			
	-s cpu	Displa	ys the CoD information of CPU.			
	-v		ys detailed information. It the -v option is specified, the lown of keys is displayed.			
EXTENDED DESCRIPTION	The following p	arameter	s are displayed as the types of resource.			
	PROC	CoD res	ource of CPU			
	l					

## showcod(8)

is owned for PPAR-ID 1).
for PPAR 1: 0
Dinformation in detail (in the case that the pparadm, pparmgr, vilege is owned for PPAR-ID 1).
for PPAR 1: 0 [Permanent Ocores]
D information of all CPUs in detail (in the case that the atop privilege is owned).

SYNOPSIS	showcodusage	[-v][-M]	[-p{resource ppar all}]			
	showcodusage	-h				
DESCRIPTION	showcodusage Activation in u		mand to display the current status of the CPU core			
			uted with nothing specified, the overview of the CPU core have been installed is displayed with the current status of			
Privileges	To execute this	command	l, any of the following privileges is required.			
	platadm,plat fieldeng	cop,	Enables execution for all physical partitions (PPARs).			
	pparadm, ppar pparop	rmgr,	Enables execution for PPARs for which you have access privilege.			
	For details on ı	user privil	eges, see setprivileges(8).			
OPTIONS	The following o	options are	e supported.			
	-h		the usage. Specifying this option with another option or causes an error.			
	– M	Displays	s text one screen at a time.			
	-p all	Displays	all CPU core Activation information.			
	-p ppar	Displays text one screen at a time by using more. It displays the key information of the CPU core Activation for each PPAR. The displayed statistics information includes the number of the CPU core Activations which are used by PPAR, number of the resources assigned to PPAR, and number of the CPU core Activations assigned to PPAR.				
	-p resource	Displays the key information of the CPU core Activation.				
	- V	Displays detailed information. The information regarding the usage statuses of all usable CoDs (including the usage statuses of the CPU core Activations in both of the system and its domains) is displayed.				

EXTENDED DESCRIPTION		howcodusage -p resource is used, the key information of the following D resources regarding the system is displayed.				
	Resource	Type of usable CoD resource (processor) The following parameters are displayed.				
		PROC	CoD resource of CPU. The unit is cores.			
	In Use	If communication	D resources currently used in the system with Hypervisor cannot be established, the D resources currently used in the system			
	Installed	Number of the Co	D resources attached to the system			
	COD Permitted	Number of the CI installed	PU core Activations which have been			
	Status	Any of the follow	ing CoD statuses			
		OKIndicates that there is enough number CPU core Activations for the CoD resources in use. In addition, the num of the remaining CPU core Activations which can be used.VIOLATIONThere are some violation of CPU core Activation. The number of the CoD resources in use which exceeds the number of the CPU core Activations available is displayed. It is when the number of the CoD resources in use exceeds the number of the CPU core				
		Activations due to forcible deletion CPU core Activation keys from the database that this situation may occ				
		ge -p ppar is used, the key information of the following CoD ding each PPAR is displayed.				
	PPAR-ID/	Each PPAR and type of CoD resource The CoD resources with Unused displayed are those not use in PPAR.				
	Resource					
	In Use	Number of the Co	oD resources currently used in PPAR			
	Installed	Number of the Co	oD resources attached to PPAR			
	Assigned	Number of the CPU core Activations assigned to PPAR				

**EXAMPLES** Users with privileges regarding the platform can display the overview of the key information on both resources and PPAR. Users with privileges regarding PPAR can only display the overview of the key information for which they have the privilege and reports of the CPU core Activation not in use.

**EXAMPLE 1** Display the key information of the CoDs for each resource type.

XSCF> showcodusage -p resource						
Resource In Use Installed CoD Permitted Status

NAME	showconsolepath - Displays the information of the domain console that is currently connected to the physical partition (PPAR).				
SYNOPSIS	showconsolepat	<b>h</b> -a			
	<pre>showconsolepath -p ppar_id</pre>				
	showconsolepat	<b>h</b> -h			
DESCRIPTION		ath is a command to y connected to PPA	o display the information of the domain R.		
	The following co	ntents are displayed	d.		
	User	XSCF user accour	its connected to the domain consoles		
	PPAR-ID	PPAR ID			
	RO/RW	Type of domain c	onsole		
		ro rw	Read-only console Writable console		
	escape	Escape sign set in	console		
	Date	Date and time when XSCF connected to the domain console			
Privileges	To execute this c	s command, any of the following privileges is required.			
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng				
	pparadm, pparm	rmgr, pparop Enables execution for PPARs for which you have access privilege.			
	For details on us	ls on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.				
	-a	Displays the information of the consoles connected to all accessible PPARs.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	-p ppar_id	Specifies the PPAR-ID to display the information. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .			

## **EXTENDED** To one PPAR, just one writable console can be connected while multiple read-only consoles can be connected.

**EXAMPLES EXAMPLE 1** Display the information of the consoles connected to all accessible PPARs.

	XSCF> showconsolepath -a					
	User	PPAR-ID	ro/rw	escape	Date	
	nakagawa	00	rw	@	Fri Jul 29 21:23:34	
	hana	00	ro	#	Fri Jul 29 09:49:12	
	k-okano	00	ro	#	Fri Jul 29 18:21:50	
	yuuki	01	rw		Fri Jul 29 10:19:18	
	uchida	01	ro	*	Fri Jul 29 13:30:41	
EXIT STATUS	The following exit values are returned.					
	0	Indicates	normal	end.		
	>0	Indicates	error oc	currence.		
SEE ALSO	console (8), sendb	reak(8)				

NAME	showdate - Displays the date and time of the XSCF clock.		
SYNOPSIS	showdate [-u]		
	showdate -h		
DESCRIPTION	showdate is a command to display the date and time of the XSCF clock.		
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, Enables execution for all PPARs. auditadm, auditop, fieldeng		
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
	-u Specifies the time in the Universal Coordinated Time (UTC). If omitted, the local time is applicable.		
EXTENDED DESCRIPTION	You can set the date and time of the XSCF clock by using setdate(8).		
EXAMPLES	<b>EXAMPLE 1</b> Display the current time in local time (JST).		
	XSCF> <b>showdate</b> Sat Oct 20 14:53:00 JST 2012		
	<b>EXAMPLE 2</b> Display the current time in UTC.		
	XSCF> <b>showdate -u</b> Sat Oct 20 05:56:15 UTC 2012		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	<pre>setdate(8), settimezone(8), showtimezone(8)</pre>		

showdate(8)

NAME	showdateoffset - Displays the difference between the system time and the Hypervisor time of each physical partition (PPAR).		
SYNOPSIS	<pre>showdateoffset -p ppar_id</pre>		
	showdateoffset	[-a]	
	showdateoffset	-h	
DESCRIPTION	showdateoffset is a command to display the difference between the system time managed by the XSCF clock and the Hyper visor time managed by each PPAR clock, by seconds.		
	PPAR is stored. I	erence between the system time and the Hypervisor time of each f the system time is set by setdate(8), etc., the difference between ime of each PPAR and the system time is updated.	
	The difference of the time is retained even if PPAR or the system is restarted.		
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng		
	pparadm, pparm	ngr, pparop Enables execution for PPARs for which you have access privilege.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the differences form the Hypervisor times of all PPARs.	
		Even if the option is omitted, the difference from the Hypervisor times of all PPARs as in the case that the -a option is specified.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-p ppar_id	Specifies the PPAR-ID to display the difference from the system time. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
EXAMPLES		lay the difference between the system time and the Hypervisor time PAR-ID 1.	
	XSCF> <b>showdat</b> PPAR-ID 01	teoffset -p 1 Domain Date Offset 0 sec	

	EXAMPLE 2	Display the differences between the system time and the Hypervisor times of all PPARs.	
	XSCF> <b>showdateoffset -a</b>		
	PPAR-ID	Domain Date Offset	
	00	0 sec	
	01	0 sec	
	02	0 sec	
	03	0 sec	
	04	0 sec	
	05	0 sec	
	06	0 sec	
	07	0 sec	
	08	0 sec	
	09	0 sec	
	10	0 sec	
	11	0 sec	
	12	0 sec	
	13	0 sec	
	14	0 sec	
	15	0 sec	
EXIT STATUS	The follow	The following exit values are returned.	
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	resetdateoffset (8)		

NAME	showdomainconfig - Displays the configuration information of the logical domain of the specified physical partition (PPAR).		
SYNOPSIS	showdomainconfig -p ppar_id [-M]		
	showdomaincon	fig -h	
DESCRIPTION	showdomainconfig is a command to display the logical domain configuration information.		
	The following se	tting values are displayed.	
	Index	Administration number in the XSCF of logical domain configuration	
	PPAR-ID	PPAR ID	
	Booting config (Current)	Logical domain configuration name used in the PPAR currently in operation	
	Booting config(Next)	Logical domain configuration name used next time when PPAR is started	
	config_name	Logical domain configuration name	
	date_created	Date and time to create logical domain configuration	
	domains	Number of the logical domains included in logical domain configuration	
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, fieldeng, pparadm, pparmgr, pparop		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	- M	Displays text one screen at a time.	
	-p ppar_id	Specifies the PPAR-ID to display the logical domain configuration information.Depending on the system configuration, you can specify only one integer from 0 to 15 for <i>ppar_id</i> .	

EXAMPLES	<b>EXAMPLE 1</b> Display the logical domain configuration information set in PPAR-ID 0.		
	XSCF> showdomainconfig -p 0		
	PPAR-ID :0		
	Booting config		
	(Current) :ldm-set1		
	(Next) :ldm-set2		
	Index :1		
	config_name :factory-default		
	domains :1		
	date_created:-		
	Index :2		
	config_name :ldm-set1		
	domains :8		
	date_created:'2012-08-08 11:34:56'		
	Index :3		
	config_name :ldm-set2		
	domains :20		
	date_created:'2012-08-09 12:43:56'		
	Index :4		
	config_name :initial		
	domains :256		
	date_created:'2012-08-08 11:34:56' XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	setdomainconfig (8)		

NAME	showdomainstatus - Displays the status of the current logical domain.		
SYNOPSIS	showdomainstatus -p ppar_id [-M] [-g domainname]		
	showdomainstatus -h		
DESCRIPTION	showdomainstatus is a command to display the status of the current logical domain.		
	The statuses to be displayed are below.		
	<ul> <li>Logical Domain Name</li> </ul>		
	Host name of logical domain. If the number of characters in the host name exceeds 21, the characters after the 21st characters are not displayed. If the logical domain has not been started, "-" is displayed.		
	∎ Status		
	Operating status of the current logical domain. The following statuses are displayed.		
	Host Stopped	The logical domain is stopped	
	Solaris booting	In the status in which the Oracle Solaris of the logical domain is starting	
	Solaris running	In the status in which the Oracle Solaris of the logical domain is running	
	Solaris halting	In the status in which the Oracle Solaris of the logical domain is executing the shutdown processing	
	Solaris powering down	In the status in which the Oracle Solaris of the logical domain is executing the power-off processing	
	Solaris rebooting	In the status in which the Oracle Solaris of the logical domain is being reset	
	Solaris panicking	In the status in which a panic is occurring in the Oracle Solaris of the logical domain	
	Solaris debugging	In the status in which the kmdb prompt of the logical domain is stopped	
		In the status in which Kernel Debug is running	
	OpenBoot initializing	In the status in which the OpenBoot PROM of the logical domain is executing the initialization processing	
	OpenBoot Running	In the status in which the OpenBoot PROM of the logical domain has completed initialization or the operation is stopped by the ok prompt	

OpenBoot Primary Boot Loader	In the status in which the Oracle Solaris of the logical domain is loading	
OpenBoot Running OS Boot	In the status in which the Oracle Solaris of the logical domain is in transition	
OS Started. No state support	In the status in which SUNW, soft-state-supported CIF has not been executed and SUNW, set-trap-table CIF is in execution	
OpenBoot Running Host Halted	In the status in which the Oracle Solaris of the logical domain is executing init 0	
OpenBoot Exited	In the status in which the ok prompt of the logical domain is executing reset-all	
OpenBoot Host Received Break	In the status in which the Oracle Solaris of the logical domain called enter service	
OpenBoot Failed	In the status in which an error occurred in the initialization of the logical domain by OpenBoot PROM	
Unknown	In the status in which the host name matching that of the logical domain specified by the option by the user is not found and unknown	
	It includes the status in which add-spconfig has not been executed by Logical Domains (LDoms) Manager.	
-	In the status in which no physical partition (PPAR) is defined	
To execute this command, any of the following privileges is required.		
useradm, platadm, platop, Enables execution for all PPARs. fieldeng pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.		
	Boot Loader OpenBoot Running OS Boot OS Started. No state support OpenBoot Running Host Halted OpenBoot Exited OpenBoot Host Received Break OpenBoot Failed Unknown - To execute this comman useradm, platadm, plat fieldeng pparadm, pparmgr, ppa	

# **OPTIONS** | The following options are supported.

l

	-g domainname	Specifies the host name of the logical domain to be displayed. If the -g option is omitted, the information of all logical domains under the PPAR to be displayed is displayed.		
		Up to 255 characters can be used to specify <i>domainname</i> . To include "#" in <i>domainname</i> , specify a backslash (\) just before it like "\#." To include ";," specify a backslash (\) just before it like "\;." To include "(," specify a backslash (\) just before it like "\(." To include "),", specify a backslash (\) just before it like "\)." To include a symbol, specify it by enclosing the entire value in single quotation marks (') or double quotation marks ("). (e.g. 'guest01').		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	– M	Displays text one screen at a time.		
	-p ppar_id	Specifies the PPAR-ID to display the status. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .		
EXAMPLES	<b>S EXAMPLE 1</b> Display the statuses of all logical domains on PPAR-ID 0.			
		mainstatus -p 0 n Name Status Solaris running Solaris running Solaris booting Solaris powering down Solaris panicking Shutdown Started OpenBoot initializing OpenBoot Primary Boot Loader		
	EXAMPLE 2 Disp ID 0.	lay the statuses of the logical domain whose name is guest01 on PPAR-		
	XSCF> showdomainstatus -p 0 -g guest01			
	Logical Domai: guest01	n Name Status Solaris powering down		
	-	lays the status of the logical domain named as guest01 on PPAR-ID 0 (no is assigned to PPAR).		
	XSCF> showdor	mainstatus -p 0 -g guest01		

	Logical Domain Name - PPAR 0 is not config	Status - gured.	
EXIT STATUS	The following exit values are returned.		
	0 Indic	ates normal end.	
	>0 Indic	ates error occurrence.	
SEE ALSO	showpparstatus (8)		

NAME	showdualpowerfeed - Displays the status of the dual power feed mode.				
SYNOPSIS	showdualpowerfeed				
	showdualpowerfeed -h				
DESCRIPTION	showdualpowerfeed is a command to display the status of the dual power feed mode.				
	The dual power feed mode can be set by setdualpowerfeed(8).				
Privileges	To execute this command, platadm or fieldeng privilege is required.				
0	For details on user privileges, see setprivileges(8).				
	Tor details on deer privileges, see Seeprivileges(6).				
OPTIONS	The following options are supported.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
EXAMPLES	<b>EXAMPLE 1</b> On the SPARC M10-1, displays the current setting of dual power feed mode.				
	XSCF> <b>showdualpowerfeed</b> BB#00: Dual power feed is enabled.				
	<b>EXAMPLE 2</b> On the SPARC M10-4S (with crossbar boxes), displays the current setting of dual power feed mode.				
	XSCF> showdualpowerfeed				
	BB#00:Dual power feed is disabled.				
	BB#01:Dual power feed is disabled.

NAME	showenvironment - Displays the intake-air temperature and humidity, temperature sensor information, voltage sensor information, and fan rotation information of the system.			
SYNOPSIS	<pre>showenvironment [-M] [temp volt Fan power air]</pre>			
	showenvironment -h			
DESCRIPTION	showenvironme	ent is a command to display the following information.		
	The following information is displayed.			
	Environment information	Intake-air temperature of the system		
	Humidity information	Intake-air temperature of the system and exhaust-air temperatures of each component		
		You can confirm the exhaust-air temperatures of the following components. SPARC M10-1		
		Mother board unit (MBU), CPU, DIMM, SW, SAS SPARC M10-1/M10-4 (without crossbar box)		
		CMUU, CMUL, CPU, DIMM, SW, SAS, XBChip SPARC M10-4S (with crossbar box)		
		Display information of SPARC M10-4S (with crossbar box) and temperature information inside the crossbar box		
	Voltage information	Voltage sensor value		
info	mormanon	Displays the margin settings information if voltage margin is set.		
	Fan rotation information	Rotation status and rotation speed of fan		
	Power monitor	Power consumption information		
	Air flow	Exhaust-air amount of the system		
<b>Privileges</b> To execute this command, any of the following privileges		ommand, any of the following privileges is required.		
	useradm, platadm, platop, fieldeng			
	For details on user privileges, see setprivileges(8).			
I				

OPTIONS	The following options are supported.			
	-h	Displays the usag or operand causes	e. Specifying this option with another option an error.	
	- M	Displays text one	screen at a time.	
<b>OPERANDS</b>	The following ope	erands are support	ed.	
	temp volt Fan  power air	Specifies the type of the information to be displayed. Any of the following types can be specified. If omitted, the information of the intake-air temperature of the system is displayed.		
		temp	Displays the temperature information.	
		volt	Displays the voltage information.	
		Fan	Displays the rotation information of fan.	
		power	Displays the power consumption information.	
		air	Displays the exhaust-air amount of the system.	
EXTENDED DESCRIPTION	The information displayed by the power and air operands does not include the information of the PCI Expansion Unit or the peripheral I/O devices.			
EXAMPLES	<b>EXAMPLE 1</b> Display the intake-air temperature of the system.			
	XSCF> showenvironment			
	BB#00 Temperature:30 71C

NAME	showfru - Displays the contents of settings regarding the hardware devices.			
SYNOPSIS	showfru device location			
	showfru -a [-M]			
	showfru -h			
DESCRIPTION	showfru is a command to display the contents set in the hardware of the devices by setupfru(8).			
	The contents of the specified device or all devices can be displayed. You can specify a physical system board (PSB) as the device.			
	The following contents are displayed.			
	Device Device name			
		Any of the followi	ng values is displayed.	
		sb	PSB	
		сри	CPU in PSB	
	Location	Position where the	e device is mounted	
		This is displayed i	n the format below.	
		<ul> <li>If Device is sb</li> </ul>		
		<i>xx-y</i> :		
		xx	Integer from 00 to 15	
		<i>y</i>	It is fixed to 0.	
		<ul> <li>If Device is cp</li> </ul>	u	
		xx-y-z: xx	Integer from 00 to 15	
		y	It is fixed to 0.	
		z	Integer from 0 to 3	
		Mirror mode of th	e memory set in PSB	
	Mode	Either of the following values is displayed.		
		yes no	Memory mirror mode Not in the memory mirror mode	
Privileges	To execute this command, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			

## showfru(8)

OPTIONS	The following options are supported.				
	-a	Displa	Displays the contents of all devices.		
	-h		ays the usage. Specifying this option with another option erand causes an error.		
	– M	Displa	ays text one screen at a time.		
OPERANDS	The followi	ng operands	operands are supported.		
	device	Specifi be spec	es the device to be displayed. The following devices can cified.		
		sb	PSB		
		cpu	CPU in PSB		
	location	Specifi	tes the location where the <i>device</i> is mounted.		
		This is	specified using the following format.		
	<ul> <li>If device is sb</li> </ul>				
		xx-y:			
		xx	Integer from 00 to 15		
		у	It is fixed to 0.		
		■ If de	evice is cpu		
		xx-y-z:			
		xx	Integer from 00 to 15		
		у	It is fixed to 0.		
		9 Z	Integer from 0 to 3		
EXTENDED DESCRIPTION	You can set	the hardware	e of the devices by using setupfru(8).		
EXAMPLES	EXAMPLE 1	Display the in	nformation set in all devices.		
	sb		Memory Mirror Mode		
	cpu cpu	00-0-0	yes yes		
	cpu	00-0-2	yes		
	cpu	00-0-3	yes		
	sb	01-0			
	cpu	01-0-0	yes		
	cpu	01-0-1	yes		
	cpu	01-0-2	yes

showfru(8)

NAME	showhardconf - D mounted on the s	Displays the information of the Field Replaceable Unit (FRU) erver.		
SYNOPSIS	showhardconf [-u] [-M]			
	showhardconf -h	1		
DESCRIPTION	showhardconf is a command to display the information of each FRU.			
	The information to be displayed is below.			
	<ul> <li>Current configuration and status</li> </ul>			
	<ul> <li>Number of the</li> </ul>	mounted units		
	<ul> <li>Physical partition (PPAR) information</li> </ul>			
	<ul> <li>PCI Expansion</li> </ul>	Unit information (Displayed only if the power of PPAR is on)		
	<ul> <li>PCI card information (Displayed only if the power of PPAR is on)</li> </ul>			
Privileges	To execute this command, any of the following privileges is required.			
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng			
	pparadm, pparmo	gr, pparop Enables execution for PPARs for which you have access privilege.		
	For details on use	er privileges, see setprivileges(8).		
OPTIONS	The following opt	tions are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	- M	Displays text one screen at a time.		
	-u	Displays the number of each mounted FRU. In addition, the operation frequency is displayed for the CPU module. The DIMM type and size are displayed for the memory. If omitted, the current configuration and status information and PPAR information of each FRU are displayed.		

### EXTENDED DESCRIPTION

 If the configuration, status information, and PPAR information of FRU is displayed, an asterisk (\*) indicating an abnormality and any of the following statuses are displayed for the units in which a failure or degradation occurred.

	Status	Contents	
	Faulted	In the status in which the unit is not in operation due to a failure.	
	Degraded	The unit is in operation. The unit is also showing a failure status because part of the unit has a failure or is degraded or some error is detected, but the unit is in normal operation.	
	Deconfigured	In the status in which the unit is degraded though it is normally operating due to a configuration abnormality, environment abnormality, or degradation of another unit.	
	Maintenance	Maintenance work is in progress. deletefru(8), replacefru(8), or addfru(8) is operating.	
	Normal	In the status in which the unit is in normal operation.	
	• For SPARC M10-4S, if the mode switches on the operator panels of the master cabinet and cabinets whose XSCFs are standby do not match, an asterisk (*) is displayed on the operator panel units of the master cabinet and cabinets whose XSCFs are standby.		
EXAMPLES	EXAMPLE 1 Displa	ay the FRU information of SPARC M10-1.

NAME	showhostname - Displays the host names set in the master cabinet and cabinets whose XSCFs are standby.			
SYNOPSIS	showhostn	showhostname { -a   xscfu}		
	showhostn	ame -h		
DESCRIPTION	showhostname is a command to display the host names set currently in the master cabinet and cabinets whose XSCFs are standby.			
	The host na	me is displayed in the Fully Qualified Domain Name (FQDN) format.		
Privileges	No privileges are required to execute this command.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-a	Displays the host names set in the master cabinet and cabinets whose XSCFs are standby. The cabinet name specified with the -a option becomes invalid.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
OPERANDS	The followi	The following operands are supported.		
	xscfu	Specifies the cabinet name to be displayed. Depending on the system configuration, you can specify either of the following. If the cabinet name is specified with the -a option, it becomes invalid.		
		<ul> <li>For configuration with SPARC M10-4S (with crossbar box)</li> </ul>		
		For XBBOX#80, specify "xbbox#80."		
		For XBBOX#81, specify "xbbox#81."		
		<ul> <li>For configuration with SPARC M10-4S (without crossbar box)</li> </ul>		
		For BB#00, specify "bb#00."		
		For BB#01, specify "bb#01."		
EXTENDED DESCRIPTION		e sethostname(8), you can set the host name of the master cabinet and on which XSCF is in the standby status.		
EXAMPLES	EXAMPLE 1	Display the host name which has been set to the master cabinet and the cabi-

NAME	showhttps - Displays the status of the HTTPS service set in the XSCF network.		
SYNOPSIS	showhttps [-M]		
	showhttps -t [-M]		
	showhttps -h		
DESCRIPTION	showhttps is a command to display the status of the HTTPS service set currently in the XSCF network.		
	You can confirm whether HTTPS service is in operation and the installation status of the information required for authentication. If it is installed, the date of installation is also displayed.		
	The following statuses are displayed.		
	HTTPS status	Whether HTTPS service is in operation	
	Server key	Whether the private key of the Web server is installed	
	CA key	Whether the private key of the certificate authority is installed	
	CA cert	Whether the certificate of the certificate authority is installed	
	CSR	Web server certificate request	
Privileges	No privileges are required to execute this command.		
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	- M	Displays text one screen at a time.	
	-t	Displays the set certificate.	
EXTENDED DESCRIPTION	You can set the HTTPS service of the XSCF network by using sethttps(8).		
EXAMPLES	EXAMPLE 1 Displa	ay the status of HTTPS service and the installation status of the key.	
	CA key: instal	-

NAME	showlocator - Displays the status of the CHECK LED on the operation panel.				
SYNOPSIS	showlocator [-a -b bb_id]				
	<b>showlocator</b> -h				
DESCRIPTION	showlocator is a command to display the blinking status of the CHECK LEDs of the operation panels mounted in SPARC M10 Systems cabinets and crossbar boxes (XBBOXs).				
	Any of the follow	ving statuses is displayed.			
	Off (Off)	Indicates that it is normal, the input power is being off, or the power fails.			
	Blinking (Blinking)	Indicates that it is a cabinet subject to maintenance.			
	On (Lighted)	Indicates that an abnormality is detected.			
Privileges	To execute this command, any of the following privileges is required.				
	useradm, platadm, platop, fieldeng				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-a Displays the statuses of all CHECK LEDs connected currently.				
	-b <i>bb_id</i> Displays the status of the CHECK LEDs of the SPARC M10 Systems cabinets and crossbar boxes corresponding to the specified <i>bb_id</i> . If omitted, the status of the CHECK LED of the cabinet itself is displayed.				
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
EXTENDED DESCRIPTION	You can set the blinking status of CHECK LED by using setlocator(8).				
EXAMPLES	EXAMPLE 1 Displ	ay the status of CHECK LED of BB-ID 10.			
	XSCF> <b>showlocator -b 10</b> BB#10: Locator LED status: Blinking				

	<b>EXAMPLE 2</b> Display the statuses of all CHECK LEDs.
	<pre>XSCF&gt; showlocator -a XB-Box#80 : Locator LED status: Blinking : BB#00 : Locator LED status: Blinking BB#01 : Locator LED status: Off BB#02 : Locator LED status: On :</pre>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	showloginlockout - Displays the time set in the lockout function of the user account.					
SYNOPSIS	showloginlockout					
	showloginlockout -h					
DESCRIPTION	showloginlockout is a command to display the time by minutes when login is prohibited after failing in login three times in a row.					
Privileges	To execute this command, useradm privilege is required.					
	For details on user privileges, see setprivileges(8).					
OPTIONS	The following options are supported.					
	-h Displays the usage. Specifying this option with another option or operand causes an error.					
EXTENDED DESCRIPTION	The user can attempt login three times in a row. If the third attempt fails, login is prohibited for the time set by setloginlockout(8). showloginlockout displays the set lockout time by minutes.					
	If the set lockout time elapses, attempt to log in is allowed again.					
EXAMPLES	<b>EXAMPLE 1</b> Display the timeout time of lockout.

showloginlockout(8)

NAME	showlogs - Displays the specified log.						
SYNOPSIS	<b>showlogs</b> [-t <i>time</i> [-T <i>time</i> ]] [-v -V -S] [-r] [-M] error						
	<pre>showlogs [-t time [-T time]   -p timestamp] [-v] [-r] [-M] event</pre>						
	<pre>showlogs [-t time [-T time]] [-r] [-M] power</pre>						
	<pre>showlogs {-a -b bb_id} [-t time [-T time]] [-r] [-M] env</pre>						
	showlogs [-r] [-M] monitor						
	<pre>showlogs -p ppar_id [-t</pre>	time [-T	<pre>time]][-r][-M]{console ipl panic}</pre>				
	showlogs -h						
DESCRIPTION	showlogs is a command	d to displa	ay the specified log.				
	The logs are displayed in following logs can be sp		ogical order of time stamps by default. The each unit of collection.				
	System unit		<ul> <li>Error log (Scan logs may be included.)</li> <li>Power log</li> <li>Event log</li> <li>Monitoring log</li> </ul>				
	SPARC M10 Systems cab	vinet	<ul><li>Temperature history</li></ul>				
	Physical partition (PPAR		<ul> <li>Console message log</li> </ul>				
			<ul> <li>Panic message log</li> </ul>				
	■ IPL message log						
Privileges	To execute this command, any of the following privileges is required.						
	■ Error log, event log, t	emperatu	re history, monitoring log				
	platadm, platop, fi	leldeng					
	<ul> <li>Power log</li> </ul>						
	platadm, platop, Enables execution for all PPARs. fieldeng		execution for all PPARs.				
	pparadm, pparmgr		execution for PPARs for which you have ration privilege.				

	<ul> <li>Console message log</li> </ul>		g, panic message log, IPL message log			
	platadm, plato fieldeng	op,	Enables execution for all PPARs.			
	pparadm, pparmgr, pparop		Enables execution for PPARs for which you have access privilege.			
	<ul> <li>Scan log</li> <li>fieldeng</li> </ul>					
	For details on us	er priv	ivileges, see setprivileges(8).			
OPTIONS	The following op	otions a	are supported.			
	-a		abinets on the system are subject. This can be specified for emperature history.			
	-ъ bb_id	for th M10-	ifies only one BB-ID to display the log. This can be specified ne temperature history. The <i>bb_id</i> , on the SPARC M10-1/ 4, fixed to 0. On the SPARC M10-4S, you can specify an er from 0 to 15, and from 80 to 83 in case of crossbar box.			
			plays the usage. Specifying this option with another option operand causes an error.			
	- M	Disp	splays text one screen at a time.			
	-p ppar_id	the c log. l	ifies a single PPAR-ID to display. This can be specified for onsole message log, panic message log, and IPL message Depending on the system configuration, you can specify an er from 0 to 15 for <i>ppar_id</i> .			
	- P timestamp		e log is displayed alone, specify the time stamp of the log. can be specified for the error log and event log.			
		times	tamp is specified in any of the following formats.			
		уууу-	-mm-dd,hh:mm:ss			
			The value is specified in the year-month- day,hour:minute:second format.			
		]	<i>ld/yy,hh:mm:ss</i> The value is specified in the month/day/ year,hour:minute:second format.			
		Monu	<i>Idhh:mm:ssyyyy</i> The value is specified in the month-			
			name,day,hour:minute:second,year format.			

I

-r	Displays logs in reverse chronological order of time stamps. By default, logs are displayed in chronological order of time stamps.
- S	Displays the scan log attached to an error log. Only the users with fieldeng privilege can specify it. It cannot be specified with the $-v$ or $-V$ option.
-t time	Specifies the starting date and time for specifying the display range of logs. Any of the following specification formats is applied.
	yyyy-mm-dd,hh:mm
	The value is specified in the year-month-day,hour:minute format. mm/dd/yy,hh:mm
	The value is specified in the month/day/year,hour:minute format.
	Monddhh:mmyyyy
	The value is specified in the month- name,day,hour:minute,year format. yyyy-mm-dd,hh:mm:ss
	The value is specified in the year-month- day,hour:minute:second format. mm/dd/yy,hh:mm:ss
	The value is specified in the month/day/ year,hour:minute:second format. Monddhh:mm:ssyyyy
	The value is specified in the month- name,day,hour:minute:second,year format.
	Even if it is specified with the -r option, the specifications of the -t and -T option will never be reversed. It cannot be used for monitoring logs.

	-т time	Specifies the ending date and time for specifying the display range of logs. Any of the following specification formats is applied.
		yyyy-mm-dd,hh:mm
		The value is specified in the year-month-day,hour:minute format. mm/dd/yy,hh:mm
		The value is specified in the month/day/year,hour:minute format.
		Monddhh:mmyyyy The value is specified in the month- name,day,hour:minute,year format.
		yyyy-mm-dd,hh:mm:ss The value is specified in the year-month- day,hour:minute:second format. mm/dd/yy,hh:mm:ss
		The value is specified in the month/day/ year,hour:minute:second format. Monddhh:mm:ssyyyy
		The value is specified in the month- name,day,hour:minute:second,year format.
		Even if it is specified with the -r option, the specifications of the -t and -T option will never be reversed. It cannot be used for monitoring logs.
	-v	Displays detailed information. In addition to normal display, the detailed diagnosis code (Diagnostic Code) is displayed. It cannot be specified with the -V or -S option. This can be specified for the error log and event log.
	- V	Displays more detailed information. If the machine administration detail log information, the PCI card information, and the I/O error fault log information have been collected, those are displayed in addition to the information displayed by the $-v$ option. They may not be collected depending on the type of error event. It cannot be specified with the $-v$ or $-s$ option. This can be specified for the error log.
OPERANDS	The following operands are supported.	
	error	Displays the error log. (Scan logs may be included.)
	event	Displays the event log.
	power	Displays the power log.

	env	Displays the temperature history.				
	monitor	Displays the monitoring log.				
	console	Displays the console message log.				
	ipl	Displays the IPL message log.				
	panic	Displays the panic message log.				
	panic	Displays the pathe message log.				
EXTENDED	Each log is displ	ayed in the following format.

EXIT STATUS	The following exit values are returned.				
	0	Indicates normal end.			
	>0	Indicates error occurrence.			

NAME	showmonitorlog - Displays the contents of the monitoring message log in real time.
SYNOPSIS	showmonitorlog
	showmonitorlog -h
DESCRIPTION	showmonitorlog is a command to display the contents of the monitoring message log in real time. It is similar to "tail -f."
	If showmonitorlog is executed, the command is not terminated to display the monitoring message log and the XSCF shell is occupied. If a message is registered in a monitoring message log, the content is displayed. If the command is executed, nothing is displayed until a monitoring log is registered next time.
	To terminate real-time display, press [Ctrl]+[C] key.
Privileges	To execute this command, any of the following privileges is required.
	platadm, platop, fieldeng
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXAMPLES	<b>EXAMPLE 1</b> Display the contents of the monitoring message log in real time.
	<pre>XSCF&gt; showmonitorlog Jun 23 12:17:18 PAPL-SERVER Warning: /BB#0/CMUL,/UNSPECIFIED:SCF:SCF SPI FMEM access error Jul 10 14:13:32 PAPL-SERVER Alarm: /BB#0/CMUU:SCF:Critical low voltage error Jul 11 13:40:20 PAPL-SERVER Information: /BB#0/XBU#0:ANALYZE:CPU-XB interface correctable error Jul 11 13:46:21 PAPL-SERVER Notice: /FIRMWARE,/BB#0/CMUL:SCF:SCF process down detected Jul 11 15:31:54 PAPL-SERVER Event: SCF:System powered on .</pre>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

showmonitorlog(8)

NAME	shownameserver - Displays the name servers and search paths set in the XSCF network.				
SYNOPSIS	shownameserver				
	shownameserver -h				
DESCRIPTION	shownameserver is a command to display the list of the IP addresses of the name server and search paths set currently in the XSCF network.				
Privileges	No privileges are required to execute this command.				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
EXTENDED DESCRIPTION	You can set the name servers and search paths of the XSCF network by using setnameserver(8).				
EXAMPLES	<b>EXAMPLE 1</b> Display the name servers set currently in the XSCF network. We take as an example the case that three name servers and five search paths are set.				
	<pre>XSCF&gt; shownameserver nameserver 192.168.1.2 nameserver 10.18.108.10 nameserver 10.24.1.2 search example1.com search example2.com search example3.com search example5.com</pre>				
	<b>EXAMPLE 2</b> Display the name servers set currently in the XSCF network. We take as an example the case that no name server or search path is set.				
	XSCF> <b>shownameserver</b> nameserver search				
EXIT STATUS	The following exit values are returned.				
	0 Indicates normal end.				
	>0 Indicates error occurrence.

NAME	shownetwork - Displays the information of the network interface set in the XSCF.			
SYNOPSIS	shownetwork [-M] [-a -i  <i>interface</i> ]			
	shownetwork -h			
DESCRIPTION	shownetwork is a command to display the information of the network interface set currently in the XSCF. You can display the information of the specified network interface or all network			
	interfaces. The fo	llowing information is displayed.		
	xscf#x-y	XSCF network interface name		
	HWaddr	MAC address (Displayed in hexadecimal)		
	inet addr	IP address		
	Bcast	Broadcast		
	Mask	Netmask		
	UP/DOWN	Whether the network interface is valid		
Privileges	No privileges are	e required to execute this command.		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following op	tions are supported.		
	-a	Displays the information set in all XSCF network interfaces.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-i	Displays the status of the current XSCF network.		
	– M	Displays text one screen at a time.		

		1 11	llowing operands are supported.			
	interface	Specifies the network interface to be displayed. You can specify any of the following depending on the system configuration. If it is specified with the -a option, it becomes invalid.				
		<ul> <li>For SPARC M10-4S (with crossbar box)</li> </ul>				
		xbbox#80-lan#0 xbbox#80-lan#1 lan#0	XBBOX#80-LAN#0 XBBOX#80-LAN#1 Take-over IP address of XBBOX#80-LAN#0 and			
		xbbox#81-lan#0 xbbox#81-lan#1	XBBOX#81-LAN#0 XBBOX#81-LAN#0 XBBOX#81-LAN#1			
		lan#1	Take-over IP addresses of XBBOX#80-LAN#1 and XBBOX#81-LAN#1			
		■ For SPARC M10-4S (without crossbar box)				
		bb#00-lan#0 BB#00-LAN#0				
		bb#00-lan#1	BB#00-LAN#1			
		lan#0	Take-over IP addresses of BB#00- LAN#0 and BB#01-LAN#0			
		bb#01-lan#0	BB#01-LAN#0			
		bb#01-lan#1	BB#01-LAN#1			
		lan#1	Take-over IP addresses of BB#00- LAN#1 and BB#01-LAN#1			
		■ For SPARC M10-1/M1	0-4			
		bb#00-lan#0	BB#00-LAN#0			
		lan#0	Abbreviated form of bb#00-lan#0			
		bb#00-lan#1	BB#00-LAN#1			
		lan#1	Abbreviated form of bb#00-lan#1			
EXTENDED DESCRIPTION	of XSCF reco XSCF unit is and lan#1.	gnized in multi-XSCF config set in lan#0 and lan#1, yo	esses which can be used without switch guration. If each LAN port of an active u can access them by the names, lan#0			
	bb#0-lan#1	r SPARC M10-1/M10-4, lan#0 is fixed to bb#0-lan#0 and lan#1 is fixed to #0-lan#1.				
		C M10-4S, if the take-over IP address is disabled by setnetwork(8), displayed even with the take-over IP address specified by york.				

```
    You can set the XSCF network interface by using setnetwork(8).

EXAMPLES
              EXAMPLE 1 Display the information set in LAN#1 of XBBOX#80.
                XSCF> shownetwork xbbox#80-lan#1
                xbbox#80-lan#1
                          Link encap:Ethernet HWaddr 00:00:00:12:34:56

NAME	showntp - Displ	ays the NTP information se	t in the XSCF network.		
SYNOPSIS	<b>showntp</b> {-1   -a   <i>address</i>   -s   -m}				
	showntp -h				
DESCRIPTION	showntp is a cor network.	nmand to display the NTP	information set currently in the XSCF		
	The following in	formation can be displayed.			
	■ NTP server re	gistered in the XSCF netwo	rk		
	<ul> <li>Synchronization</li> </ul>	chronization status with the upper NTP servers			
	<ul> <li>Whether NTP</li> </ul>	service is provided to the c	lient		
		set in the XSCF network			
	-	referred server is specified			
	<ul> <li>Clock address</li> </ul>	of the local clock set in XSO	CF		
Privileges	No privileges are	e required to execute this co	mmand.		
	For details on us	er privileges, see setprivi	leges(8).		
OPTIONS	The following op	tions are supported.			
	-a	Displays all NTP servers	set currently in the XSCF network.		
	-h	Displays the usage. Specif or operand causes an erro	ying this option with another option r.		
	-1	Displays whether it is syn	chronized with the NTP server		
	- m	Displays whether the pref clock address of the local	erred server is specified (perfer) and clock (localaddr).		
		In perfer, either of the f	ollowing is displayed.		
		-	referred server is specified. referred server is not specified.		
			ignificant byte of the clock address of is displayed by a figure from 0 to 3.		
	- S	Displays the stratum valu	e set in XSCF.		

l

<b>OPERANDS</b>	The following operands are supported.					
	address	Specifies the IP address or host name of the NTP server to be displayed. If the -a option is specified, it becomes invalid.				
		To specify them by the IP address, <i>address</i> can be specified in a format using four sets of integers separated by periods (.).				
		xxx.xxx.xxxSpecifies an integer from 0 to 255. This ca be specified using zero suppression.				
		To specify them by the host name, specify <i>address</i> within 64 characters in a format separating the label elements by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) Depending on the DNS server, the server name needs to be name-resolvable.				
EXTENDED DESCRIPTION	server display	ferred server is not specified, there is no prefer information in the NTP splayed by showntp.				
	You can set th	set the NTP server of the XSCF network by using setntp(8).				
	are displayed.	executed after executing setntp(8), the contents set by setntp(8) To confirm the settings information of the NTP currently in cute this command with the -l option.				
EXAMPLES		ay all registered NTP servers. If -mprefer=off is set by setntp, the acters prefer are not displayed.				
	XSCF> <b>showntp -a</b> client : enable server : disable					
	server ntpl.example.com prefer server ntp2.example.com					
	<b>EXAMPLE 2</b> Confirm synchronization with the NTP server and display the result.					
	XSCF> showntr					
	remote ===========	refid st t when poll reach delay offset jitter				
		192.168.1.56 2 u 27 64 377 12.929 -2.756 1.993				
	+192.168.0.57 127.127.1.0	192.168.1.86         2 u         32         64         377         13.030         2.184         94.421           .LOCL.         5 1         44         64         377         0.000         0.000         0.008				

	<b>EXAMPLE 3</b> Display the stratum value set in the XSCF network <del>.</del>
	XSCF> <b>showntp -s</b> stratum : 5
	<b>EXAMPLE 4</b> Display whether the preferred server is specified and the clock address of the local clock.
	XSCF> <b>showntp -m</b> prefer : on localaddr : 0
	<b>EXAMPLE 5</b> Confirm synchronization if the NTP server is not synchronized with the upper NTP servers and the service is not provided to the client.
	XSCF> <b>showntp -l</b> NTP is unavailable.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	showpacketfilters - Displays the IP packet filtering rules set in the XSCF network.				
SYNOPSIS	showpacketfilters {-a   -1} [-M]				
	showpacketfilters -h				
DESCRIPTION	showpacketfilters is a command to displays the IP packet filtering rules set in the XSCF network.				
Privileges	No privileges are required to execute this command.				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-a Displays the IP packet filtering rules set in the XSCF network.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
	-1 Displays the operation status of the IP packet filtering rules set in the XSCF network.				
	-M Displays text one screen at a time.				
EXTENDED DESCRIPTION	You can set the IP packet filtering rules used in the XSCF network by using setpacketfilters(8).				
EXAMPLES	<b>EXAMPLE 1</b> For SPARC M10-4S (with crossbar box), display the IP packet filtering rules set in the XSCF network.				
	<pre>XSCF&gt; showpacketfilters -a -s 172.16.0.0/255.255.0.0 -i xbbox#80-lan#0 -j DROP -s 172.16.0.0/255.255.0.0 -i xbbox#81-lan#0 -j DROP -s 10.10.10.10/255.255.255.255 -j DROP -s 192.168.100.0/255.255.255.0 -i xbbox#80-lan#1 -j ACCEPT -s 192.168.100.0/255.255.255.0 -i xbbox#81-lan#1 -j ACCEPT -i xbbox#80-lan#1 -j DROP -i xbbox#81-lan#1 -j DROP</pre>				
	<b>EXAMPLE 2</b> For SPARC M10-4S (with crossbar box), display the operation status of the IP packet filtering rules of the XSCF network.				
	XSCF>       showpacketfilters -1         pkts       bytes target       prot in       source         0       0 DROP       all xbbox#80-lan#0       172.16.0.0/255.255.0.0         0       0 DROP       all *       10.10.10.10         0       0 ACCEPT       all xbbox#80-lan#1       192.168.100.0/255.255.255.0         0       0 DROP       all xbbox#80-lan#1       0.0.0.0/0.0.0         pkts       bytes target       prot in       source

NAME	showpasswordpolicy - Displays the current password policy setting.		
SYNOPSIS	showpasswordpolicy		
	showpasswordpolicy -h		
DESCRIPTION	showpasswordpolicy is a command to display the password policy setting.		
	The pam_cracklib module, date of the effective period, and number of the passwords stored in the password history are included.		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	<b>EXAMPLE 1</b> Display the password policy setting.		
	<pre>XSCF&gt; showpasswordpolicy Mindays: 0 Maxdays: 99999 Warn: 7 Inactive: -1 Expiry: 0 Retry: 3 Difok: 10 Minlen: 9 Dcredit: 1 Ucredit: 1 Lcredit: 1 Remember: 3</pre>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	setpasswordpolicy (8)		

showpasswordpolicy(8)

NAME	showpciboxdio - Displays each PCI slot setting of whether to enable the direct I/O function for PCI card mounted on PCI Expansion unit.		
SYNOPSIS	<pre>showpciboxdio [-a -b bb_id] [-M] all</pre>		
	showpciboxdio [-a -b bb_id] [-M] slot_no		
	showpciboxdio -h		
DESCRIPTION	showpciboxdio is a command to display the enable/disable setting information of the direct I/O function for each PCI card mounted on the PCI Expansion unit.		
	This command is not supported on SPARC M10-1.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the setting information of the direct I/O function for all SPARC M10-4/M10-4S. When omitting both -a and -b options, the setting information of the current SPARC M10-4/M10-4S is displayed.	
	-ъ bb_id	Specifies a BB-ID of the target server to be displayed. On SPARC M10-4, only 0 can be specified for <i>bb_id</i> . On SPARC M10-4S, an integer 0-15 can be specified for <i>bb_id</i> depending on the system configuration. When omitting both -a and -b options, the setting information of the current SPARC M10-4/M10-4S is displayed.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	– M	Displays text one screen at a time.	
OPERANDS			
	all	Displays the settings of all PCI slots on the specified server. This operand cannot be used with the <i>slot_no</i> at the same time.	
	slot_no	Specifies the number of a PCI slot to be displayed. An integer 0- 10 can be specified in no particular order. Plural slot numbers can be specified at the same time by inserting space characters. This operand cannot be used with the all at the same time.	

```
showpciboxdio cannot be executed for any crossbar box. And omitting -a and
   EXTENDED
DESCRIPTION
                      -b bb_id fails with an error when operating on the crossbar box.
                   This command can be executed only in the case where the power of a PPAR, in
                      which the target server's physical system board (PSB) is included, is turned off.
                      In other cases, the command fails with an error. When the power of the PPAR is
                      not turned off, an error occurs and the settings will be reflected at the next boot.
                     The configured settings will be ignored when 8-10 is specified for the slot
                      number in SPARC M10-4S.

    You can configure each PCI slot setting of whether to enable the direct I/O

                      function for PCI card mounted on PCI Expansion unit by using
                      setpciboxdio(8).
   EXAMPLES
                   EXAMPLE 1
                               Displaying setting information of PCI slots 2, 3, and 7 of BB-ID 2.
                     XSCF> showpciboxdio -b 2 2 3 7
                     PCI slot Direct I/O via PCIBOX

showpciboxdio(8)

NAME	showpcl - Displays the physical partition (PPAR) configuration information (PCL) that is currently set.
SYNOPSIS	showpcl [-v] -a [-M]
	<b>showpcl</b> [-v] -p <i>ppar_id</i> [ [-1 <i>lsb</i> ]]
	showpcl -h
DESCRIPTION	showpcl is a command to display the PCL set by setpcl(8).
	PCL is hardware resource information which can be set in PPAR or logical system boards (LEB) composing PPAR.
	LSB is the unit of system boards recognized by Hypervisor. It is indicated by an independent integer from 00 to 15 for each PPAR.
	The system board (PSB) means the boards recognized by system and mounted as hardware.

PPAR-ID	PPAR ID
LSB	LSB number. An integer from 00 to 15 is displayed.
PSB	PSB number corresponding to LSB. This is displayed in the format below.
	xx-y:xxInteger from 00 to 15yIt is fixed to 0
Status	Operating status of PPAR. Any of the following is displayed.
	<pre>Powered Off In the power-off status Initialization Phase In the status in which POST is in operation Initialization Complete In the status in which POST is completed and Oracle Solaris is running Hypervisor Abort The status between occurrence of Hypervisor Abort and reset</pre>

	If the -v option is specified, the following information is added.					
	Cfg-policy	Degradation range in the case that an abnormality is detected in the initial hardware diagnosis. Any of the following is displayed				
		FRU	Degradation occurs by part such as CPU and memory (Default).			
		PSB	Degrades by PSB.			
		System	Degrades by PPAR.			
	No-Mem	Whether to make the logical domain use the memory mounted LSB. Either of the following is displayed.				
		True	Does not allow use of memory.			
		False	Allows use of memory (Default).			
	No-IO		the logical domain use the I/O devices mounted he following is displayed.			
		True	Does not allow use of I/O devices.			
		False	Allows use of I/O devices (Default).			
Privileges	To execute this command, any of the following privileges is required.					
	platadm,plato fieldeng	atop, Enables execution for all PPARs.				
	pparadm, pparm pparop	ngr, Enables execution for PPARs for which you have access privilege.				
	For details on us	er privileges, see setprivileges(8).				
OPTIONS	The following op	tions are supported				
	-a	Displays the infor	mation of all PPARs.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.				
	-l lsb	integer from 0 to 2 option by separati	number to be displayed. <i>lsb</i> is specified by an 15. You can specify multiple values for the -1 ng them with spaces. If the -1 option is n PPAR are subject.			

	l						
	– M		Displa comma		e screen a	t a time. l	t is similar to more
	-p ppar_id		Specifies the PPAR-ID to be display configuration, an integer from 0 to				
	-v			ys additio 5-10 of PC		informatio	on of Cfg-policy, No-Mem,
EXTENDED DESCRIPTION	You can set PCL by using setpcl(8).						
EXAMPLES	EXAMPLE 1	Displa	play the PCL information set in PPAR-ID 0.				0.
	XSCF> sh	ownel	-D 0				
	PPAR-ID	LSB	PSB	Status

NAME	showpowercapping - Displays the status of power consumption limitation.
SYNOPSIS	showpowercapping
	showpowercapping -h
DESCRIPTION	showpowercapping is a command to display the status of power consumption limitation of the system.
	The following statuses are displayed.
	<ul> <li>Whether the power consumption limiting function is enabled or disabled</li> </ul>
	Displays whether to enable/disable the power consumption limiting function of the system.
	<ul> <li>Upper limit of power consumption</li> </ul>
	<ul> <li>Upper limit of power consumption (Wattage)</li> </ul>
	Displays the upper limit of power consumption by wattage.
	<ul> <li>Upper limit of power consumption (%)</li> </ul>
	Displays the upper limit of power consumption by percentage.
	Converts the minimum power consumption value (0%) and maximum power consumption value (100%) of the system to the upper limit power value (watt).
	If the upper limit of the power consumption of setpowercapping(8) is set by wattage specification, no value is displayed.
	<ul> <li>Window time for exceeding the upper limit</li> </ul>
	Displays the window time (second) until recognition as violation after the power consumption value of the system exceeds the upper limit of power consumption.
	<ul> <li>System operation at the time of violation</li> </ul>
	Displays the system operation (display of warning message, shutdown processing, and forcible power-off processing) when the window time for exceeding the upper limit elapsed while the power consumption value of the system exceeds the upper limit of power consumption.
	You can confirm the minimum power consumption value and maximum power consumption value of the system by showenvironment(8).
Privileges	To execute this command, any of the following privileges is required.
	useradm, platadm, platop, fieldeng
	For details on user privileges, see setprivileges(8).

OPTIONS	The following options are supported.							
	-h Displays the usage. Specifying this option with another option or operand causes an error.							
EXAMPLES	<b>EXAMPLE 1</b> Display the status of power consumption limitation of the system. (If the upper limit of power consumption of setpowercapping(8) is set by percent specification)							
	<pre>XSCF&gt; showpowercapping activate_state :enabled powerlimit :25% timelimit :30 violation_actions :none XSCF&gt;</pre>							
	<b>EXAMPLE 2</b> Display the status of power consumption limitation of the system. (If the upper limit of power consumption of setpowercapping(8) is set by wattage specification)							
	<pre>XSCF&gt; showpowercapping activate_state :enabled powerlimit :1000w timelimit :300 violation_actions :poff XSCF&gt;</pre>							
EXIT STATUS	The following exit values are returned.							
	0 Indicates normal end.							
	>0 Indicates error occurrence.							
SEE ALSO	<pre>setpowercapping(8), showenvironment(8)</pre>							

NAME	showpowerschedule - Displays the schedule operation information.					
SYNOPSIS	<pre>showpowerschedule {-p ppar_id -a} -m state</pre>					
	<pre>showpowerschedule {-p ppar_id -a} -mlist [-v] [-M]</pre>					
	showpowersched	dule -h				
DESCRIPTION	showpowersche	dule is a command to display the schedule operation information.				
	The types of the displayed contents are the following two.					
		garding the schedule operation settings				
	<ul> <li>PPAR-ID</li> </ul>					
	<ul> <li>Whether scl</li> </ul>	hedule operation is enabled/disabled				
		the set schedules				
	-	he power recovery mode				
		garding the schedule				
	<ul> <li>Schedule ID</li> </ul>	)				
	<ul> <li>PPAR-ID</li> <li>Specification</li> </ul>	n method				
	<ul><li>Specification method</li><li>Period/Date of specification</li></ul>					
		<ul> <li>Power-on time</li> </ul>				
	<ul> <li>Power-off ti</li> </ul>					
Privileges	To execute this command, any of the following privileges is required.					
	platadm, platop Enables execution for all PPARs.					
	pparadm, pparm pparop	gr, Enables execution for PPARs for which you have accessible privilege.				
	For details on user privileges, see setprivileges(8).					
OPTIONS	The following options are supported.					
	-a	Displays the schedule information of all physical partitions (PPARs).				
	-h	Displays the usage. Specifying this option with another option or operand causes an error.				
	- M	Displays text one screen at a time.				
	-mlist	Displays the schedule information.				
l						

	-m state Displays the schedule operation settings.						
	-p <i>ppar_id</i> Displays the information of the specified <i>ppar_id</i> . Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .						
	-v Displays the information of the next power-on time and power-off time of PPAR.						
EXTENDED	<ul> <li>To change the schedule operation information, use setpowerschedule(8).</li> </ul>						
DESCRIPTION	<ul> <li>To set the schedule, use addpowerschedule(8). To delete it, use deletepowerschedule(8).</li> </ul>						
	<ul> <li>Specifying a non-existent <i>ppar_id</i> or invalid option causes an error.</li> </ul>						
EXAMPLES	<b>EXAMPLE 1</b> Display the schedule status which sets to all PPARs.						
	<pre>XSCF&gt; showpowerschedule -a -m state PPAR-ID schedule member recover mode 0 disable - on 1 enable 2 auto 2 enable 1 on 3 disable - off XSCF&gt; EXAMPLE 2 Display the schedule list of PPAR-ID 1. (If the command is executed at 0 o'clock on January 1st without the -v option.) XSCF&gt; showpowerschedule -p 1 -m list ID# PPAR-ID Type Term/Date OnTime/OffTime Pattern</pre>

showpowerschedule(8)

NAME	showpowerupdelay - Displays the warm-up time and wait time for air conditioning of the system that is currently set.			
SYNOPSIS	showpowerupde	lay		
	showpowerupde	lay -h		
DESCRIPTION		lay is a command to display the warm-up time and wait time for of the system that is currently set.		
	The following co	ntents are displayed.		
	warmup time	Warm-up time. The setting value of each physical partition (PPAR) is displayed.		
	wait time	Wait time for air conditioning		
Privileges	To execute this co	ommand, any of the following privileges is required.		
	platadm, plato	p,pparadm,pparmgr,pparop,fieldeng		
	For details on use	er privileges, see setprivileges(8).		
OPTIONS	The following op	tions are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	You can set the w using setpower	varm-up time and wait time for air conditioning of the system by updelay(8).		
EXAMPLES	EXAMPLE 1 Displ	ay the warm-up time and wait time for air conditioning of the system.		
	PPAR#01 :	<pre>:10 minute(s) :10 minute(s) :15 minute(s)</pre>		
EXIT STATUS	The following ex	it values are returned.		
	0	Indicates normal end.		
	>0	Indicates error occurrence.		
SEE ALSO	setpowerupdelay	7(8)

NAME	showpparmode - Displays the operation mode of the physical partition (PPAR) that is currently set.				
SYNOPSIS	<b>showpparmode</b> -p <i>p</i>	ppar_id [-v]			
	<b>showpparmode</b> -h				
DESCRIPTION	showpparmode is a command to display the operation mode set currently in the specified PPAR.				
	The following statuses are displayed.				
	HOST-ID	Host ID			
		If no host ID is ass	signed, a hyphen (-) is displayed.		
	Diagnositics Level		of the self-diagnosis test (POST)		
		Any of the followi	ng is displayed.		
		off min max	None Standard (default) Maximum		
	Message Level	Detailed level of the console message of the POST diagno			
	-	Any of the following is displayed.			
		none	None		
		min	Limited volume		
		normal	Normal volume (default)		
		max	Maximum volume		
		debug	Debug output		
	Host Watchdog	Operation of PPAR at the time of host watchdog timeout			
	operation at the time of timeout	Any of the followi	ng is displayed.		
		none	None		
		dumpcore	Generates panic		
		reset	Resets the PPAR (default)		
	Break Signal	Whether the break	signal is enabled or disabled		
		on	Enabled (default)		
		off Disabled			

# showpparmode(8)

	Autoboot (Guest Domain)		Whether the guest domain autoboot is enabled or disabled when PPAR is started	
		on off	Enabled (default) Disabled	
	Elastic Mode	Whether the enabled or c	low-power operation of CPU or memory is isabled	
		on off	Enabled Disabled (default)	
	IOreconfigure	Whether to a reset	reconfigure I/O buses when PPAR is started or	
		Any of the f	ollowing is displayed.	
		true false nextboot	Enabled Disabled Enabled only when the next boot	
	Ethernet Address		AC) address of PPAR	
		This address is used if the environment variable of PROM, local-mac-address?, is false. This inford displayed only if the -v option is specified. However Ethernet (MAC) address is not assigned, a hyphen displayed.		
Privileges	To execute this com	mand, any of the following privileges is required.		
	platadm, fielder	ng Enables e	g Enables execution for all PPARs.	
	pparadm		execution for PPARs for which you have ration privilege.	
	For details on user	privileges, see	setprivileges(8).	
OPTIONS	The following optic	ons are support	ed.	
		Displays the usage. Specifying this option with another option or operand causes an error.		
	(	Specifies the PPAR-ID to be displayed. Depending on the syste configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .		
	-v I		ed information. If the $-v$ option is specified, the address of PPAR is also displayed.	

EXTENDED DESCRIPTION	operation but the setting status of the mode switch operator panel is "Servi	he operation mode displayed by showpparmode does not indicate the actual peration but the setting status. The actual operation varies according to the atus of the mode switch of the operator panel. If the mode switch of the perator panel is "Service," the operation mode of PPAR is set as follows gardless of the contents displayed by showpparmode.			
		Watchdog timeout, autoboot of the guest domain, on, I/O bus reconfiguration: As the display of			
	<ul> <li>Alive Check: Disabled</li> </ul>				
	<ul> <li>Break signal (STOP-A)</li> </ul>	: Sending a signal			
	-	can set the operation mode of PPAR by using setpparmode(8).			
EXAMPLES	<b>EXAMPLE 1</b> Display the opera	ation mode of the PPAR set in PPAR-ID 0.

SEE ALSO	setpparmode (8)		

NAME	showpparparam - Displays the OpenBoot PROM environmental variable of the control domain which will be set at the subsequent startup of the specified physical partition (PPAR).			
SYNOPSIS	showpparparam -p ppar_id			
	showpparparam	-p <i>ppar_id</i> -c auto-boot		
	showpparparam -h			
DESCRIPTION	showpparparam is a command to display the setting value of the OpenBoot PROM environmental variable of the control domain which will be set at the subsequent startup of the specified physical partition (PPAR).			
	<b>Note</b> – When you changed the value of the environmental variable from OpenBoot PROM while the PPAR is in operation, it will not be applied to the showpparparam output. When you start up the PPAR next time, the value you changed in OpenBoot PROM will be set.			
	The following set	ting values are displayed.		
	use-nvramrc Displays the setting value of the OpenBoot PROM environment variable use-nvramrc? of the control domain.			
	security-mode Displays the setting value of the OpenBoot PROM environment variable security-mode of the control domain.			
	bootscript Displays the setting values of the OpenBoot PROM environment variables of the control domain by bootscript.			
Privileges	To execute this command, any of the following privileges is required.			
	useradm,platao platop,fielder			
	pparadm, pparm pparop	ngr, Enables execution for PPARs for which you have accessible privilege.		
	For details on use	er privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-h Displays the usage. Specifying this option with another option or operand causes an error.			
	-c auto-boot -p ppar_id	Displays the setting value of OpenBoot PROM environment variables auto-boot?.		
	-p ppar_id	Specifies the PPAR-ID to be displayed.		

# showpparparam(8)

EXTENDED DESCRIPTION	• A hyphen "-" will be displayed as the value of the OpenBoot PROM environment variables which are not set will be displayed.
	<ul> <li>The value which is set by using the setpparparam(8) will be cleared after you start up the PPAR next time.</li> </ul>
EXAMPLES	<b>EXAMPLE 1</b> Display the setting value OpenBoot PROM environment variables of the control domain set in PPAR-ID 0.
	<pre>XSCF&gt; showpparparam -p 0 use-nvramrc :false security-mode :none bootscript : setenv auto-boot? true setenv input-device virtual-console setenv output-device virtual-console</pre>
	<b>EXAMPLE 2</b> Display the setting OpenBoot PROM environment variables auto-boot? of the control domain set in PPAR-ID 0.
	XSCF> <b>showpparparam -p 0 -c auto-boot</b> auto-boot? :true
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	setpparparam (8)

NAME	showpparstatus - Displays the status of the current physical partition (PPAR).				
SYNOPSIS	showpparstatus -p ppar_id				
	showpparstatus -a				
	showpparstatus -h				
DESCRIPTION	showpparstatus is	a command to display the status of current PPAR.			
	Any of the following	statuses is displayed for each PPAR.			
	Powered Off In the power-off status				
	Initialization Phase	In the status in which POST is in operation			
	Initialization Complete	In the status in which Power-On Self-Test (POST) is completed			
	Running In the status in which POST is completed and Oracle Solaris is running.				
	Hypervisor Aborted The status between occurrence of Hypervisor Abort and reset				
	- Other than those above (when PPAR is not defined)				
Privileges	To execute this command, any of the following privileges is required.				
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng				
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.				
	For details on user p	rivileges, see setprivileges(8).			
OPTIONS	The following option	s are supported.			
	-a Di	splays the statuses of all accessible PPARs.			
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
	-p <i>ppar_id</i> Specifies the PPAR-ID to display the status. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .				

EXTENDED DESCRIPTION	You can confirm the status of the logical domain by using showdomainstatus(8).		
EXAMPLES	<b>EXAMPLE 1</b> Display the statuses of all PPARs.		
	PPAR-ID 00 01 02 03 04 05 06 07 08 09 10 11 12 12 13	<pre>Dowpparstatus -a PPAR Status Powered Off Initialization Phase Initialization Phase Running - Hypervisor Aborted Running Initialization Complete Initialization Phase Initialization Phase - Powered Off Running Running</pre>	
	14 15	Powered Off -

NAME	showremotepwrmgmt - Displays the settings of the remote power management function and the power status of the Node.				
SYNOPSIS	<b>SYNOPSIS</b> showremotepwrmgmt [-a -G groupid [-N nodeid]] [-M]				
	showremotepwri	ngmt -h			
DESCRIPTION	to display the management information of nd the power status of the specified node.				
	In showremotepwrmgmt, the following information is displayed.				
	[Remote Power N	lanagement Group	Information]		
	GroupID	0 1	D of the specified remote power management from 01 to 32 is displayed.		
	Remote Power Management	This is the status of group.	of the specified remote power management		
	Status	Enable	The remote power management function enabled		
		Disable	The remote power management function disabled		
	NodeID	Node ID of the spe decimal is displaye	ecified node. An integer from 001 to 128 as a ed.		
	NodeType	This is the type of nodes is displayed Master HOST HOST I/O PwrLinkBox Others	the specified node. Any of the following l. Server device (Master HOST Node) Server device (HOST Node) I/O device (I/O Node) Remote power management box (I/O Node) Other node		
	NodeIdentName	This is the unique number of bytes is	ID or name to identify a node. The maximum 32.		

Power	This is the power status of the specified node. Either of the followings is displayed.		
	ON OFF	Power-on Power-off	
PowerLinkage	This is the power-of followings is display		for the specified node. Any of the
	Disable		Remote power management disabled
	Enable Enable(Power-O Enable(Power-O Link)		Power-on/Power-off link enabled Only power-on link enabled
			Only power-off link enabled
Operation	This is the power-o displayed	on method.	Either of the followings is
	IPMI	Power-on	
	WakeUpOnLAN	Power-on	by Wake-On LAN
[Power Status Inf	ormation]		
any subnode. Sub	onodes are displayed	l in the form	de, and subnode(s) when there is nat as "SubNode#xx", in which "xx" s displayed for the power status.
ON	Power-on		
OFF	Power-off		
[IPMI Information	n]		
IPMI UserName			the controller to control the node umber of bytes is 20.
IPMI IP address			PMI port of the controller to control displayed in the IPv4 format.
IPMI Slave Address	This is the IPMI Slave Address of the controller to control the node to be linked. This is displayed in hexadecimal.		
			MI specification "Intelligent ce Specification Second Generation
IPMI MAC Address	This is the IPMI M node to be linked.	AC addres	s of the controller to control the

Privileges	To execute this command, any of the following privileges is required.				
	platadm, platop, fieldeng				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-a	Displays the management information of all the set remote power management groups. This is the same as that displayed when executing showremotepwrmgmt without specifying any options.			
	-G groupid	Specifies one or more group IDs of the remote power management group to be displayed. A figure from 1 to 32 can be specified.			
		e.gG 1			
		To specify multiple remote power management groups by range, specify the group IDs of the remote power management groups included in the range separating the beginning and end by hyphens (-).			
		e.gG 2-10			
		To specify multiple remote power management groups or ranges of remote power management groups, specify them separating by commas (,). Overlapping specification causes an error.			
		e.gG 1,3,5			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	– M	Displays text one screen at a time.			
	-N nodeid	Specifies one node of the remote power management device registered to the remote power management group specified by the -G option and to be displayed. 1A figure from 1 to 128 can be specified.			
		e.gN 1			
EXTENDED DESCRIPTION	<ul> <li>Execution specifying a remote power management group not constructed by the "-G" option causes an error.</li> </ul>				
	no remote pov	is is executed for all remote power management groups by the -a option and emote power management group is constructed (initial status or after uting clearremotepwrmgmt (8)), it causes an error.			

 If this is executed specifying the remote power management device subject to display by the -N option, and the -G option specified at the same time is specified by range, it causes an error.

**EXAMPLES EXAMPLE 1** Display the information of all the registered remote power management groups.

NAME	showroute - Displays the routing information set in the XSCF network interface.				
SYNOPSIS	<b>showroute</b> [-M] [-n] {-a   <i>interface</i> }				
	showroute -h				
DESCRIPTION	showroute is a command to display the routing information set currently in the XSCF network interface.				
	You can display the routing information of the specified network interface or all network interfaces. The following information is displayed.				
	Destination	Destination IP add	dress		
	Gateway	Gateway			
	Netmask	Netmask			
	Flags	Flag indicating the status of routing			
		U H G R C !	Route enabled Only one host reachable Gateway used Dynamic route to be restored Entry of cache Rejected route		
	Interface	XSCF network int	erface name		
Privileges	No privileges are	e required to execut	e this command.		
	For details on us	For details on user privileges, see setprivileges(8).			
OPTIONS	The following op	e following options are supported.			
	-a	Displays the routing information set in all the XSCF network interfaces.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	– M	Displays text one	screen at a time.		
	-n	Displays the IP address without name-resolution of the host name.			

OPERANDS	The following operands are supported.						
	interface		Specifies the network interface to be displayed. You can specify any of the following depending on the system configuration. If it is specified with the -a option, it becomes invalid.				
			■ For SPARC M	10-4S (with cross	bar box)

NAME	showsscp - Dis (SSCP).	plays the IP address assigned to the SP to SP communication protocol	
SYNOPSIS	<b>showsscp</b> [-a -b <i>bb_id</i> ] [-N <i>network_id</i> ] [-M]		
	showsscp -h		
DESCRIPTION		command to display the setting values of the SSCP links of the or crossbar boxes.	
		ses of the SSCP links in the system are displayed, they are output in ble is sorted by PPAR-ID.	
		ss of the specific PPAR or service processor is displayed, not a table address of the specified PPAR or service processor is displayed.	
	showsscp can	not be used on a SPARC M10-1/M10-4.	
Privileges	No privileges a	are required to execute this command.	
	For details on u	user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-a	Displays the setting values of the SSCP links of all crossbar boxes and SPARC M10-4S	
	-ь <i>bb_id</i>	Specifies the target BB-ID. For SPARC M10-4S, you can specify an integer from 00 to 15. For crossbar box, you can specify an integer from 80 to 83.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	– M	Displays text one screen at a time.	
	-N network_id	Specifies the ID of the SSCP link network subject to setting. For <i>network_id</i> , specify a figure from 0 to 2 and 0 to 4 in the case of SPARC M10-4S (without crossbar box) and SPARC M10-4S (with crossbar box), respectively. If omitted, all networks are specified.	
EXTENDED DESCRIPTION	SSCP links o	o is executed without specifying any options, the setting values of the of all crossbar boxes and SPARC M10-4S are displayed. This is similar hat the -a option is specified.	
		b is executed specifying BB-ID by -b <i>bb_id</i> , all the setting values of ks of the specified BB-ID are displayed.	
		b is executed specifying the network ID by $-N$ <i>network_id</i> , only the es of the SSCP links of the specified network ID are displayed.	

#### showsscp(8)

- You can display the setting values of the SSCP links on the specific network of the specific BB-ID by combining -b *bb\_id* and -N *network\_id*.
- You can display the setting values of all SSCP links on the specific network by combining -a and -N *network\_id*.

For information before the settings are reflected, see applynetwork(8).

■ If -N *network\_id* is specified and -b *bb\_id* is not within the following range, it causes an error.

For SPARC M10-4S (without crossbar box)

-N network_id	-b bb_id range
0	0 to 3
1	0 to 3
2	0 to 1

For SPARC M10-4S (with crossbar box)

_		
	-N network_id	-b bb_id range
_	0	0 to 15, 80
	1	0 to 15, 81
	2	80 to 83
	3	80 to 83
	4	80 to 81

#### EXAMPLES

**Note** – The IP addresses shown in the following examples are samples.

NAME	showssh - Displa network.	ys the contents of the Secure Shell (SSH) service set in the XSCF	
SYNOPSIS	showssh [-chostkey][-M]		
	showssh -c pub	key [-u user_name][-M]	
	showssh -h		
DESCRIPTION	showssh is a coı XSCF network.	mmand to display the contents of SSH service set currently in the	
	The following in	formation is displayed.	
	SSH status	Whether SSH service is enabled	
	SSH DSCP	Physical partition (PPAR) - Whether access to SSH service from PPAR is allowed via the SP communication protocol (DSCP)	
	RSA key	Host public key in the RSA format	
	DSA key	Host public key in the DSA format	
	Fingerprint	Host public key in the fingerprint format	
	1 1	user public key is specified, the user public key number and user natically given by the system are displayed.	
	In XSCF, only SS	H2 is supported.	
Privileges	To execute this c	ommand, any of the following privileges is required.	
	<ul> <li>Specification of</li> </ul>	of the user name:	
	useradm		
	<ul> <li>Other than ab No privileges</li> </ul>		
	1 0	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-c hostkey	Displays the host public key. If you omit the -c option, "-c hostkey" is assumed specified.	
	-c pubkey	Displays the user public key. If you omit the -c option, -c hostkey is assumed specified.	

## showssh(8)

	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	– M	Displays text one screen at a time.
	-u user_name	Specifies the user account name to display user public keys. It is specified with -c pubkey. If the -u option is omitted, the user public keys of the user account logged in currently are displayed.
EXTENDED DESCRIPTION	specified when	ic key numbers automatically given to user public keys can be n deleting user public keys by setssh(8). H service of the XSCF network by using setssh(8).
EXAMPLES	<b>EXAMPLE 1</b> Display the information of the host public key.

showssh(8)

NAME	showstatus - Displays the degraded Field Replaceable Unit (FRU).		
SYNOPSIS	showstatus [-M]		
	showstatus -h		
DESCRIPTION	showstatus is a FRUs composing	command to display the information of the degraded unit in the the system.	
Privileges	To execute this co	ommand, any of the following privileges is required.	
	useradm, plata	dm, platop, pparadm, pparmgr, pparop, fieldeng	
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following op	tions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	– M	Displays text one screen at a time.	
EXTENDED DESCRIPTION	one layer abov following state addition, on th	on of the unit in which a failure or degradation occurred and unit re in the FRUs composing the system is displayed. Any of the uses is displayed after "Status:" on the displayed unit. In he unit in which a failure or degradation occurred, "*" indicating points is displayed.	
	Status	Contents	
	Faulted	In the status in which the unit is not in operation due to a failure.	
	Degraded	The unit is in operation. The unit is also showing a failure status because part of the unit has a failure or is degraded or some error is detected, but the unit is in normal operation.	
	Deconfigured	In the status in which the unit is degraded though it is normally operating due to a configuration abnormality, environment abnormality, or degradation of another unit.	
	Maintenance	Maintenance work is in progress. deletefru(8), replacefru(8), or addfru(8) is operating.	
	of the master 2	composed of multiple XSCFs, if the switches of the operator panels XSCF and standby XSCFs do not match, "*" is displayed on the f the master XSCF and standby XSCFs.	

### showstatus(8)

EXAMPLES	<b>EXAMPLE 1</b> Display the degraded unit. Here, we take as an example the case that the CPU and memory on CMUL of BB#00 and PSU of XBBOX#80 are degraded due to a failure.
	<pre>XSCF&gt; showstatus BB#00; CMUL Status:Normal; * CPU#0 Status:Faulted; * MEM#00A Status:Faulted; XBBOX#80; * PSU#0 Status:Faulted;</pre>
	<b>EXAMPLE 2</b> Display the degraded part. Here, we take as an example the case that memory on MBU is degraded due to a failure.
	<pre>XSCF&gt; showstatus MBU Status:Normal; * MEM#0A Status:Faulted;</pre>
	<b>EXAMPLE 3</b> Display the degraded part. Here, we take as an example the case that memory on MBU is degraded due to a failure.
	<pre>XSCF&gt; showstatus MBU Status:Normal; * MEM#1B Status:Deconfigured;</pre>
	<b>EXAMPLE 4</b> Display the degraded part. Here, we take as an example the case that the CPU memory unit is degraded because the crossbar unit is degraded.
	<pre>XSCF&gt; showstatus BB#00 CMUU Status:Normal; * CPU#1 Status:Deconfigured; * XBU#0 Status:Degraded;</pre>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	showtelnet - Dis	plays the status of the Telnet service set in the XSCF network.
SYNOPSIS	showtelnet	
	showtelnet -h	
DESCRIPTION	showtelnet is a in the XSCF netv	a command to display the status of the Telnet service set currently vork.
	Either of the foll	owing statuses is displayed.
	enable	Indicates that the Telnet service is in operation.
	disable	Indicates that the Telnet service is not in operation.
Privileges	No privileges are	e required to execute this command.
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following op	ptions are supported.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	You can set the T	Celnet service of the XSCF network by using settelnet(8).
EXAMPLES	EXAMPLE 1 Displ	ay the status of the Telnet service set currently in the XSCF network.
	XSCF> <b>showtel</b> Telnet status

NAME	showtimezone - Displays time information.	the currently set time zone of the XSCF and the summer
SYNOPSIS	<b>showtimezone</b> -ctz	
	showtimezone -c dst [-	m {standard custom}]
	showtimezone -h	
DESCRIPTION	showtimezone is a command the summer time info	nand to display the currently set time zone of the XSCF ormation.
Privileges	To execute this command	, any of the following privileges is required.
	useradm, platadm, plat pparmgr, pparop	op, auditadm, auditop, fieldeng, pparadm,
	For details on user privile	ges, see setprivileges(8).
OPTIONS	The following options are	supported.
	-ctz	Displays the time zone.
	-c dst	Displays the information of the summer time.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-m{standard custom	Specifies the information of the summer time to be displayed. You can specify either of the following. If you omit the -m option, -m custom is assumed specified.
		standard
		Displays the information of the summer time set as standard in the current time zone.
		custom
		Displays the information of the summer time set by settimezone(8). If the summer time is not set, nothing is displayed.
EXTENDED DESCRIPTION	<ul><li>The information of the</li><li>If custom is specified</li></ul>	summer time is displayed in the following format.
	std offset dst[offset2]	from-date[/time] to-date[/time] ]
	std Abbrev	iated form of the time zone

offset	Offset time betwee (GMT)	n the time zone and Greenwich Mean Time
	If the value of the minus (-) or plus (	offset is plus or minus, it is displayed as (+), respectively.
dst	Summer time name	e
offset2	Offset time betwee	n the summer time and GMT
	If the value of the minus (-) or plus (	offset is plus or minus, it is displayed as (+), respectively.
from-date[/time]	Summer time start	information
	from-date is display	red in any of the following formats.
	figure from 1 to w: Week to start from 1 to 5 with and 5, respectiv d: Day of the we by a figure from by 0 and 6, resp Jn Jn: Date to start from 1 to 365 w February 29 is n n n: Date to start to from 1 to 365 w February 29 is c	<ul> <li>the summer time. It is displayed by a figure in the first week and last week indicated by 1 ely.</li> <li>eek to start the summer time. It is displayed in 0 to 6 with Sunday and Saturday indicated bectively.</li> <li>e the summer time. It is displayed by a figure with January 1st indicated by 1. 	before switch.	
	hh:mm:ss	This is specified in the format of "hh:mm:ss." The default is 02:00:00.

to-date[/time]	Summer time end information
	to-date is displayed in any of the following formats.
	<ul> <li>Mm.w.d</li> <li>Mm: Month to end the summer time. <i>m</i> is displayed by a figure from 1 to 12.</li> <li><i>w</i>: Week to end the summer time. It is displayed by a figure from 1 to 5 with the first week and last week indicated by 1 and 5, respectively.</li> <li><i>d</i>: Day of the week to end the summer time. It is displayed by a figure from 0 to 6 with Sunday and Saturday indicated by 0 and 6, respectively.</li> </ul>
	Jn
	Jn: Date to end the summer time. It is displayed by a figure from 1 to 365 with January 1st indicated by 1. In leap years, February 29 is not counted.
	n
	<i>n</i> : Date to end the summer time. It is displayed by a figure from 1 to 365 with January 2nd indicated by 1. In leap years, February 29 is counted.
	<i>time</i> displays the time to switch from the summer time by the time before switch.
	<i>hh:mm:ss</i> This is specified in the format of "hh:mm:ss." The default is 02:00:00.
<ul> <li>If standa</li> </ul>	ard is specified
From: de	dd MM dd hh:mm:ss yyyy dst
To: da	ld MM dd hh:mm:ss yyyy dst
ddd	Day of the week
MM	Month
dd	Day
hh	Hour
mm	Minute
<i>SS</i>	Second
уууу	Year
dst	Summer time zone name

- You can set the time zone of XSCF by using settimezone(8).
- **EXAMPLES EXAMPLE 1** Display the time zone.

```
XSCF> showtimezone -c tz
Asia/Tokyo
```

**EXAMPLE 2** Display the summer time information if you have set the time zone abbreviated form to JST, offset from GMT to +9, summer time zone name to JDT, summer time to one hour earlier, and period to 2:00 on the last Sunday of March to 2:00 on the last Sunday of October.

```
XSCF> showtimezone -c dst -m custom
JST-9JDT,M3.5.0,M10.5.0
```

**EXAMPLE 3** Display the summer time information if you have set the time zone abbreviated form to JST, offset from GMT to +9, summer time zone name to JDT, summer time to one hour earlier, and period to 0:00 on the first Sunday of April to 0:00 on the first Sunday of September.

```
XSCF> showtimezone -c dst
JST-9JDT-10,M4.1.0/00:00:00,M9.1.0/00:00:00
```

**EXAMPLE 4** If the summer time is not set by settimezone.

XSCF> showtimezone -c dst

**EXAMPLE 5** Display the information of the summer time set as standard in the current time zone.

```
XSCF> showtimezone -c dst -m standard
From: Sun Mar 25 03:00:00 2012 CEST
To: Sun Oct 28 02:59:59 2012 CEST
```

**EXAMPLE 6** If the standard summer time of the system is not set.

XSCF> showtimezone -c dst -m standard

- **EXIT STATUS** The following exit values are returned.
  - 0 Indicates normal end.
  - >0 Indicates error occurrence.

**SEE ALSO** setdate (8), settimezone (8), showdate (8)

NAME	showuser - Displays the XSCF user account information.
SYNOPSIS	<b>showuser</b> [-a][-p][-u][-M]
	<b>showuser</b> [-a] [-p] [-u] [-M] <i>user</i>
	<b>showuser</b> [-a][-p][-u][-M]-l
	showuser -h
DESCRIPTION	showuser is a command to display the XSCF user account information.
	If showuser is executed specifying the user account name, the account information of the specified user is displayed. If showuser is executed without specifying the user account name, the account information of the current user is displayed. If showuser is executed specifying the -1 option, the account information of all users is displayed.
	If showuser is executed specifying one or more options among -a, -p, and -u, the information explained in the following sections on the options is displayed. If showuser is executed without specifying any of these options, all the account information is displayed.
Privileges	To execute this command, any of the following privileges is required.
	<ul> <li>Display of your own account:</li> </ul>
	No privileges are required.
	<ul> <li>Display of the account information of other users: useradm</li> </ul>
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-a Displays the information regarding the validity of the password and status of the account. It is only valid for the XSCF user account.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
	-1 Displays the account information of all XSCF users sorted by the login name of the user. It cannot be used with the <i>user</i> operand.

### showuser(8)

	- M	Displays text one screen at a time.
	-p	Displays all privileges assigned to users. This is valid for local users and remote users.
	-u	Displays the user ID (UID). This is valid for local users and remote users.
OPERANDS	The following o	operands are supported.
	user	Name of the existing user account. It cannot be used with the -l option.
EXAMPLES	EXAMPLE 1 Dis	play the information regarding the validity of the password and account.
	XSCF> <b>show</b> User Name: Status: Minimum: Maximum: Maximum: Warning: Inactive: Last Change: Password Exp Password Exp Password Ina Account Expi <b>EXAMPLE 2</b> Disj XSCF> <b>show</b> User Name: Privileges:	jsmith Enabled 0 99999 7 -1 Aug 22, 2005 ires: Never ctive: Never res: Never play the information of the user privileges.
EXIT STATUS	The following e	exit values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	adduser (8), de setprivileges (8	leteuser(8), disableuser(8), enableuser(8), password(8), 3)

NAME	snapshot - Collects and transfers the data regarding environment, logs, errors, and Field Replaceable Unit Identifier (FRUID).
SYNOPSIS	<b>snapshot</b> -d <i>device</i> [-r] {-a -b <i>bb_id</i> } [-e [-P <i>password</i> ]] [-L {F I R}] [-1] [-v] [ [-q] -{y n}] [-S <i>time</i> [-E <i>time</i> ]]
	<b>snapshot</b> -t user@host:directory $\{-a \mid -b \ bb_id\}$ [-e [-P password]] [-k host-key] [-1] [-L $\{F \mid I \mid R\}$ ] [-p password] [-v] [[-q] - $\{y \mid n\}$ ] [-S time [-E time]]
	snapshot -h
DESCRIPTION	snapshot is a command to provide the data collection mechanism and acquire the diagnosis information on the service processor quickly, securely, and flexibly.
	snapshot collects the data of the configuration, environment, logs, error, and FRUID information and transfers it to the specified destination.
	snapshot outputs the collected data to a file. The file name is automatically generated based on the host name and IP address assigned to the service processor and the date and UTC time (hour-minute-second format) on the service processor when executing snapshot. For example, it can be jupiter:10.1.1.1_2012-10-20T22-33-44. snapshot cannot specify the output file name. If the file and command outputs are collected from the service processor, snapshot compresses the output data and write it on the archive of the .zip format.
	The output file is a .zip format archive composed of the .zip format archives into which the information collected in each SPARC M10 Systems cabinet is compressed.
	The name of .zip archive of each SPARC M10 Systems cabinet is automatically generated based on the SPARC M10 Systems name, host name and IP address assigned to the service processor and the date and UTC time (hour-minute-second format) on the service processor when executing snapshot. For example, it can be BB#01_jupiter_10.1.1.1_2012-10-20T22-33-44.
	The name of the .zip archive of the SPARC M10 Systems cabinet which does not have the host name or IP address assigned to the service processor is automatically generated based on the SPARC M10 Systems name and the date and UTC time (hour-minute-second format) on the service processor when executing snapshot. For example, it can be BB#03_2012-10-20T22-33-44.
	If snapshot is executed on slave XSCF, only the .zip archive file of the SPARC M10 Systems cabinet which executed the command is transferred to the specified destination.
	snapshot saves the collected data in the remote network host or external media device based on which of the -t and -d options is used. To save the data collected by using the -t option in the remote network host, it is necessary to specify the host name (or IP address), destination directory on the remote network host, and user name on the remote host. When saving data on the remote network host,

snapshot opens SSH network connection to function as a channel of data to the remote file. You can limit data collection on larger log files by specifying the date range with the -S option, and -E option if necessary. Encryption network protocols such as SSH and SSL are used for data transfer via network connections. To encrypt the .zip archive itself, use the -e option. To decode the .zip archive encrypted in this process, use the encrypted password specified in snapshot by openss1. The following shows an example of decoding of the file jupiter\_10.1.1.1\_2012-10-20T22-33-44.zip.e. % openss1 aes-128-cbc -d -in jupiter\_10.1.1.1\_2012-10-20T22-33-44.zip.e -out jupiter\_10.1.1.1\_2012-10-20T22-33-44.zip All . zip archives generated by snapshot contain two files generated by snapshot itself. The firs file named README describes the original name of the . zip archive, name of the setting file on the service processor used to create the . zip archive, version of snapshot, and whether the log-dedicated mode (-1 option) is used to create the archive. The second file named CONFIG is a copy of the actual setting file used by snapshot to create the archive. The data generated for each SPARC M10 Systems cabinet by snapshot may be used by field engineers to diagnose the problems with the system. snapshot can collect different sets of data according to the purpose of the diagnosis. These data sets are called Initial, Root Cause, and Full, respectively, and set by using the -L option. Privileges To execute this command, platadm or fieldeng privilege is required. For details on user privileges, see setprivileges(8).

# **OPTIONS** | The following options are supported.

-a		common logs in the system, the logs stored Systems cabinets are collected and output to
	If the system has collected.	an abnormality, some logs cannot be
-ъ bb_id	Selects the BB-ID IDs.	to collect data. You cannot specify multiple
		common logs in the system, the logs stored PARC M10 Systems cabinets are collected.
		a specify an integer from 0 to 15 and 80 to 83 PARC M10 Systems cabinet and crossbar box ely.
-d device	Specifies the exten following options	rnal media device to be used. For -d, the are available.
	-r	Deletes all files in the external media device before collecting data. This option is disabled if it is used with the -t option.
-Е time	frame of the log n time option of the	to finish collecting data. Defines the time nessages collected by snapshot with the -S start time. Only the log entries created becified by -E <i>time</i> are collected by so the -S option.
	time	Use either of the following two formats described by strptime(3).
		%Y-%m-%d,%H:%M:%S %Y-%m-%d_%H-%M-%S
-e	Encrypts the arch and <i>password</i> .	ive of the zip format. It is required to use -P
-h	Displays the usag or operand causes	e. Specifying this option with another option s an error.

-k host-key	service processor	ption. Set the public key to be used by the to log in the network host. This option is ed with the -d option.
	You can specify th	is using up to 895 characters.
	The values which	can be specified in <i>host-key</i> are below.
	none	If the public key is not used for authentication of the network host, specify this literal value.
	download	For snapshot to download the public host key of the network host using SSH and the public host key from the host specified by the -t argument, specify this literal value. snapshot displays the SHA- 256 fingerprint of the key and requests for confirmation. If the key is accepted, it is used for server authentication. If the key is rejected, snapshot is terminated without executing anything. If the -k option is not specified, this is the default operation in the SSH target mode. The specified public key is used for server authentication. The <i>host-key</i> argument must be the complete public key of the network host (beginning with the key type). (Therefore, it must be the complete contents of /etc/ssh/ ssh_host_rsa_key.pub on the network host.)
	_	c key needs to be enclosed in quotation ed by the shell as a single word.
-L {F I R}	Specifies the log se	et to be collected.
	F I R	Full log set Initial log set Root Cause log set
	If the log set is no default.	t specified, the Full log set is collected by
-1		ion so that only log files are collected. s are not collected.
-n	Automatically resp	ponds to prompt with "n" (no).

	-P password	Specifies it with th be used to encrypt	ne -e option. Set the encrypted password to the output file.
		You can specify th	is using up to 63 characters.
	-p password		vord to be used for SSH login. This option is -t option. If it is used with the -d option, it
		You can specify th	is using up to 63 characters.
	-d	Prevents display o output.	f messages, including prompt, for standard
	-s time	frame of the log m <i>time</i> option of the e	to start collecting data. Defines the time essages collected by snapshot with the -E end time. If the end time is not specified, the when snapshot is executed. See also the
		time	Use either of the following two formats described by strptime(3).
			%Y-%m-%d,%H:%M:%S %Y-%m-%d_%H-%M-%S
	-t user@host:directory	destination. Specif network host in th login to the archiv directory on the ar	ost and remote directory of the data transfer y the host name or IP address of the <i>host</i> field. Specify the user name for ssh e host in the <i>user</i> field. Specify the archive rchive host in which the output file is saved d. The <i>directory</i> field must not begin with "-
			directory is created by snapshot. Create the the remote host in advance.
	- V	snapshot files for e	information. The status of correction of each SPARC M10 Systems cabinets. If it is -q option, the -v option becomes invalid.
		executed by the sr given. In this case,	privilege to operate all commands to be napshot setting file may not have been , an error message indicating that these ons are not allowed is displayed.
	-у	Automatically resp	ponds to prompt with "y" (yes).
EXTENDED DESCRIPTION	Operation mode	o operation mode of	anonabot is described below
	The overview of the	e operation mode of	snapshot is described below.

## snapshot(8)

	The initial mode is the "SSH target mode." If the data collector is started specifying the -t option, this mode is applied for execution. In this mode, the data collector opens the SSH connection of the destination specified by the service processor (after appropriate authentication) and sends the data archive of the zip format to the destination host via the SSH connection. No target directory is created by snapshot. Create the target directory in the remote host in advance. Transfer encryption in this mode is performed by SSH. The second mode is the "USB device mode." If the data collector is started specifying the -d option, this mode is applied for execution. In this mode, the outputs of the data collector (archive of the zip format) are saved in files on the USB device. The USB device needs to have been formatted by the FAT32 file system. In this mode, you can use the -e option to encrypt zip files like the SSH target mode. However, in this mode, data is local to the service processor, so transfer encryption (like SSH) is not performed.
	To execute snapshot in the master cabinet, connect the USB device to a USB port of the master cabinet.
EXAMPLES	<b>EXAMPLE 1</b> Download data to the external media device.
	<pre>XSCF&gt; snapshot -d usb0 -r -b 3 Testing writability of USB deviceSUCCESS About to remove all files from device `usb0'. Continue? [y n] : y Collecting data into /media/usb_msd/jupiter_10.1.1.1_2012-10-20T22-41- 51.zip Data collection complete.</pre>
	<b>EXAMPLE 2</b> Limit log collection to obtain specific logs for the data range.
	XSCF> <b>snapshot -d usb0 -b 3 -S 2012-01-01,01:00:00 -E 2012-01-</b> 31_14-00-00
	Testing writability of USB deviceSUCCESS Collecting data into /media/usb_msd/jupiter_10.1.1.1_2012-10-20T22-41- 51.zip Data collection complete.
	<b>EXAMPLE 3</b> Collect the logs of all SPARC M10 Systems cabinets.
	<pre>XSCF&gt; snapshot -d usb0 -r -a Testing writability of USB deviceSUCCESS About to remove all files from device 'usb0'. Continue? [y n] : y Collecting data from BB#00SUCCESS Collecting data from BB#01FAILURE Collecting data from BB#02SUCCESS Collecting data into /media/usb_msd/jupiter_10.1.1.1_2012-10-20T22-41- 51.zip</pre>
	Data collection complete.

NAME	switchscf - Switc	hes the status of XSCF in between master and standby.	
SYNOPSIS	switchscf [ $[-q] - {y n}$ ] -t {Master   Standby} [-f]		
	switchscf -h		
DESCRIPTION	switchscf is a standby.	command to switch the status of XSCF in between active and	
	switchscf can	be used only for the systems composed of multiple XSCFs.	
		e status means master XSCF. Therefore, the master XSCF and XSCF atus is switched by executing switchscf.	
	executed for the paired XSCFs (be	be executed in the master or standby XSCF. If the command is XSCF logged in currently, switch processing is executed between etween XBBOX#80 and XBBOX#81 or between BB#00 and BB#01, if no crossbar box, respectively).	
	<b>Note –</b> When switching XSCFs, the sessions of the network connected to the master XSCF are disconnected.		
	cannot be switch of XSCF state is of whether the main and flashupdat wait until the con	hally, XSCFs cannot be switched during maintenance work. If XSCF ed because the execution result of switchscf becomes "Switching disabled due to a maintenance operation. Try again later.", confirm intenance commands of addfru(8), deletefru(8), replacefru(8), ce(8) are in execution. If any of these commands is in execution, mmand is terminated. If XSCF cannot be switched though the immand is not in execution, use the -f option to switch.	
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
0		er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-f	If XSCF is not switched, it can be switched forcibly.	
		<b>Caution</b> – The -f option forcibly switches XSCF. Therefore, use it only if switching by normal operations is impossible.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	

#### switchscf(8)

	-d	Prevents display of messages, including prompt, for standard output.
	-t Active	Switches the status of XSCF to the active status.
	-t Standby	
		Automatically responds to prompt with "y" (yes).
	-У	Automatically responds to prompt with y (yes).
Extended description	When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.	
EXAMPLES	EXAMPLE 1 Swite	h the status of the XSCF logged in currently to the standby status.
		<b>scf -t Standby</b> switch between the Master and Standby states. Continue?
		th the status of the XSCF logged in currently to the standby status. The upt is automatically given a "y" response.
		scf -t Standby -y switch between the Master and Standby states. Continue?
EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	nIndicates error occurrence.

testsb(8)

host         traceroute -h         DESCRIPTION       traceroute is a command to display the network route to the specified host. The network route means the router (gateway) to connect the specified hosts and network devices and displays what kinds of routers are located on the route. traceroute attempts to extract the ICMP TIME_EXCEEDED response using the TTL field of IP protocols from all gateways on the network route to the specified hosts or network devices.         Privileges       No privileges are required to execute this command. For details on user privileges, see setprivileges(8).         OPTIONS       The following options are supported.         -h       Displays the usage. Specifying this option with another option or operand causes an error.         -m       maxttl         Specifies the maximum number of hops. Displays the same number of gateways as the specified number of hops. If omitted, it is set to 30.         -n       Outputs just with the IP address without reverse DNS lookup.         -p port       Specifies the number of the UDP packet to be used. This is valid only if the UDP packet is used. If omitted, it is set to 33434.         -q nqueries       Specifies the number of attempts for one gateway. If omitted, it is set to 3 times.         -r       Directly transfers packets to the specified hosts or network devices ignoring the routing table. If there is no target host or network device on the same physical network, it causes an error         -r       Directly transfers packets following the route.         -v       Displays detail	NAME	traceroute - Disp	plays the network route to the specified host.	
DESCRIPTIONtraceroute is a command to display the network route to the specified host. The network route means the router (gateway) to connect the specified hosts and network devices and displays what kinds of routers are located on the route. traceroute attempts to extract the ICMP TIME_EXCEEDED response using the TTL field of IP protocols from all gateways on the network route to the specified hosts or network devices.PrivilegesNo privileges are required to execute this command. For details on user privileges, see setprivileges(8).OPTIONSThe following options are supported. -h Displays the usage. Specifying this option with another option or operand causes an error. -m maxttlSpecifies the maximum number of hops. Displays the same number of gateways as the specified number of hops. If omitted, it is set to 30. -n Outputs just with the IP address without reverse DNS lookup. -p portSpecifies the number of attempts for one gateway. If omitted, it is set to 3 times. -r Directly transfers packets to the specified hosts or network device signoring the routing table. If there is no target host or network device signoring the routing table. If there is no target host or network device on the same physical network, it causes an error -s src_addr	SYNOPSIS	<pre>traceroute [-n] [-r] [-v] [-m maxttl] [-p port] [-q nqueries] [-s src_addr] [-w wait] host</pre>		
The network route means the router (gateway) to connect the specified hosts and network devices and displays what kinds of routers are located on the route.         traceroute attempts to extract the ICMP TIME_EXCEEDED response using the TTL field of IP protocols from all gateways on the network route to the specified hosts or network devices.         Privileges       No privileges are required to execute this command.         For details on user privileges, see setprivileges(8). traceroute(8)

NAME	unlockmaintenance - Forcibly unlocks the XSCF that was locked during maintenance work.		
SYNOPSIS	unlockmaintenance [ [-q] - {y n}]		
	unlockmaintenance -h		
DESCRIPTION	unlockmaintenance is a command to forcibly unlocks the XSCF that was locked during maintenance work.		
	While addfru(8), deletefru(8), and replacefru(8), which are normally commands for maintenance, are in execution, XSCF is locked, and unlocked after completion of execution. However, if an abnormality such as disconnection of LAN during execution of any of the commands for maintenance occurs, XSCF may not be unlocked. In such as case, you can forcibly unlock XSCF by executing unlockmaintenance.		
Privileges	To execute this command, fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-n Automatically responds to prompt with "n" (no).		
	-q Prevents display of messages, including prompt, for standard output.		
	-y Automatically responds to prompt with "y" (yes).		
EXTENDED DESCRIPTION	<ul> <li>When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.</li> </ul>		
	<ul> <li>Be sure not to use this except in the case that maintenance work is stopped due to LAN disconnection, etc. because this forcibly stops the work by the maintenance menu.</li> </ul>		
	• You can execute unlockmaintenance only from the master XSCF.		
EXAMPLES	<b>EXAMPLE 1</b> Unlock XSCF that was locked by maintenance work.		
	<pre>XSCF&gt; unlockmaintenance This command unlocks the maintenance lock which prevents the multiple execution of maintenance commands. *Never* use this command, except when the lock state remains by some reason. Careless execution of this command causes serious situation because it interrupts the running command and XSCF might not be able to recognize the parts. Continue? [y n] :y</pre>		

	<b>EXAMPLE 2</b> Unlock XSCF that was locked by maintenance work. The prompt is automatically given a "y" response.
	<pre>XSCF&gt; unlockmaintenance -y This command unlocks the maintenance lock which prevents the multiple execution of maintenance commands. *Never* use this command, except when the lock state remains by some reason. Careless execution of this command causes serious situation because it interrupts the running command and XSCF might not be able to recognize the parts. Continue? [y n] :y</pre>
	<b>EXAMPLE 3</b> Unlock XSCF that was locked by maintenance work. The message is hidden and the prompt is automatically given a "y" response.
	XSCF> <b>unlockmaintenance -q -y</b> XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	addfru (8), deletefru (8), replacefru (8)

NAME	version - Displays the version number of the firmware.		
SYNOPSIS	version -c xcp [-v] [-t]		
	<b>version</b> -c {cmu   xscf} [-v] [-M]		
	version -h		
DESCRIPTION	version is a cor	nmand to display the version of the firmware.	
	The following ve	rsions can be displayed.	
	xcp	Versions of XSCF Control Package (XCP) applied to the system	
	Cmu	Representative version of CMU firmware. CMU firmware is the archives of the Power-on self test (POST)/OpenBoot PROM/ Hypervisor	
	xscf	Version of XSCF firmware	
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-с хср	Displays the versions of XCP.	
	-c cmu	Displays the representative version of the archives of the POST/ OpenBoot PROM/Hypervisor (cmu firmware version).	
	-cxscf	Displays the version of the XSCF firmware.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	– M	Displays text one screen at a time.	
	-t	Displays the information of the total number of versions of XCP registered to XSCF. It is specified with -c xcp.	
	- V	Displays detailed information. If it is specified with $-c xscf$ , the same information as in the normal status is displayed.	
EXAMPLES	EXAMPLE 1 Displ	ay the versions of XCP.	
	XSCF> <b>version</b> BB#00-XSCF#0 XCP0 (Current) XCP1 (Reserve) BB#01-XSCF#0 XCP0 (Current)	(Master) : 1090 : 1090 (Standby)	

```
XCP1 (Reserve): 1090

EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	viewaudit - Displays the audit records.		
SYNOPSIS	viewaudit		
	record] [-e events	date-time] [-B date-time][-C][-c classes] [-D date-time][-E end- ][-i audit-ids][-1][-m del][-n][-p privilege-results][-r return- record][-u users][-x]	
	viewaudit -h		
DESCRIPTION	viewaudit is a c	ommand to display the audit records.	
	If viewaudit is executed without specifying any options, all of the current local audit records are displayed. If viewaudit is executed specifying the option, only the selected records are displayed. By default, the records are displayed in the tex format. One token per line is shown and comma is used as the field separator character. The output format can be changed by separately using the options of -C -E, -l, -m <i>del</i> , -n, -S, and -x.		
Privileges	To execute this command, auditadm or auditop privilege is required.		
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-A date-time	Selects the records which occurred after <i>date-time</i> . <i>date-time</i> is based on the local time. You can specify a range by using the -A and -B options together. The valid values of <i>date-time</i> are below.	
		<ul> <li>Absolute time <i>date-time</i>: <i>yyyymmdd[hh[mm[ss]]</i>]</li> <li>The variables have the following meanings.</li> </ul>	
		<ul> <li>yyyy = Year (1970 is the earliest valid value.)</li> <li>mm = Month (01 to 12)</li> <li>dd = Day (01 to 31)</li> <li>hh = Hour (00 to 23)</li> <li>mm = Minute (00 to 59)</li> <li>ss = Second (00 to 59)</li> </ul>	
		The default values of <i>hh</i> , <i>mm</i> , and <i>ss</i> are 00.	

-B date-time	Selects the records which occurred before <i>date-time</i> . <i>date-time</i> is based on the local time. You can specify a range by using the -A and -B options together. The valid values of <i>date-time</i> are the absolute time and offset time.		
	<ul> <li>Absolute time <i>date-time</i>: <i>yyyymmdd</i>[<i>hh</i>[<i>mm</i>[<i>ss</i>]]]</li> <li>The variables have the following meanings.</li> </ul>		
	<ul> <li>yyyy = Year (1970 is the earliest valid value.)</li> <li>mm = Month (01 to 12)</li> <li>dd = Day (01 to 31)</li> <li>hh = Hour (00 to 23)</li> <li>mm = Minute (00 to 59)</li> <li>ss = Second (00 to 59)</li> </ul>		
	<ul> <li>Offset <i>date-time</i>: +n d   h   m   s</li> <li>The variables have the following meanings.</li> </ul>		
	<ul> <li>n = Number of units</li> <li>d = Number of days</li> <li>h = Number of hours</li> <li>m = Number of minutes</li> <li>s = Number of seconds</li> </ul>		
	The offset time can be specified only by the -B option and needs to be specified with the -A option.		
	The default values of <i>hh</i> , <i>mm</i> , and <i>ss</i> are 00.		
- C	Adds the number of records matching the selection standard at the end of output.		

-с classes	Selects the record of the specified class. <i>classes</i> is a comma- separated list of audit classes. Classes can be specified with a number or name. The prefix "ACS_" can be omitted. For example, the classes of audit-related events can be expressed as ACS_AUDIT, AUDIT or 2.			
	The valid classes are belo	W.		
	all	All classes		
	ACS_SYSTEM(1)	System-related event		
	ACS_write(2)	Command that can change the status		
	ACS_READ(4)	Command to display the current status		
	ACS_LOGIN(8)	Login-related event		
	ACS_AUDIT(16)	Audit-related event		
	ACS_PPAR(32)	PPAR administration-related event		
	ACS_USER(64)	User administration-related event		
	ACS_PLATFORM(128)	Platform administration-related event		
	ACS_MODES(256)	Mode-related event		
-D date-time	hours between 00:00:00 as Specify the specified date (year, month, day, hour, r time. All records with the selected. It becomes inval	occurred on a specific day (in 24 nd 23:59:59 of the specified day). in the format of <i>yyyymmddhhmmss</i> ninute, second) based on the local time stamp of the specified day are id even if the hour, minute, or second n cannot be specified with the -A or		
-E end-record	Specifies the last record matching the selection standard for display.			
-e events	Selects the record of the specified event. <i>events</i> is a comma- separated list of audit events. Events can be specified with a number or name. The prefix "AEV_" can be omitted. For example, the events of SSH login can be expressed as AEV_LOGIN_SSH, LOGIN_SSH, or 4.			
	For the list of valid events, see showaudit -e all.			
	Displays the use of Speci	fying this option with another option		

	-i <i>audit-ids</i>	Selects the record of the specified audit session identifier. If you are interested in the activities reflected in a specific audit record, you can display all audit records of the session. <i>audit-id</i> is not fixed and assigned again when the service processor is reset. <i>audit-ids</i> is a comma-separated list of audit session identifiers. <i>audit-id</i> is the number after the label "subject" of the audit file.	
		For example, <i>audit-id</i> is "1" in the following list.	
		subject,1,bob,normal,telnet 45880 jupiter	
	-1	Outputs one record per line.	
	-m del	Not the default delimiter (comma) but <i>del</i> is used as the field separator character. If <i>del</i> has a special meaning in the shell, it is necessary to enclose it in quotation marks. The maximum number of the delimiters is three. Delimiters have no meaning. In addition, they cannot be specified with the -x option.	
	-n	Specifies the UID and IP address not to convert them to the user name or host name.	
	-p privilege-results	Selects the record according to the specified <i>privilege-results</i> . <i>privilege-results</i> is a comma-separated list. <i>privilege-results</i> is granted, denied, or error.	
	-r return-values	Selects the record according to the specified return value. <i>returnvals</i> is a comma-separated list of the value success or failure. success corresponds to the return value 0. failure corresponds to nonzero return values.	
	-S start-record	Specifies the first record matching the selection standard for displayed.	
	-u <i>users</i>	Selects the records belonging to the specified user. <i>users</i> is a comma-separated list of users. The user can specify a user name or figure UID.	
	- x	Outputs in the XML format.	
EXAMPLES	EXAMPLE 1 Display	the audit records of December 12, 2005.	
	XSCF> viewaudit -D 20121212		
	file,1,2012-01-1	L1 10:52:30.391 -05:00,20120111155230.0000000000.jupiter	

l

**EXAMPLE 2** Display the audit records of all users. XSCF> viewaudit -u jsmith file,1,2012-01-11 10:52:30.391 -05:00,20120111155230.000000000.jupiter header, 37, 1, login - telnet, jupiter, 2012-01-11 11:31:09.659 -05:00 subject,1,jsmith,normal,ssh 45880 jupiter command, showuser platform access, granted return,0 **EXAMPLE 3** Display the audit records of user privileges.
