Preface

This manual describes the man pages for the XSCF firmware for SPARC M12/M10 Systems from Oracle and Fujitsu.

The XCP firmware which is described in this document might no longer be the latest available version, or the version now installed on your particular server. For the current firmware release, always refer to the Product Notes for the firmware installed and the one for the latest firmware release.

Fujitsu SPARC M12 is sold as SPARC M12 by Fujitsu in Japan. Fujitsu SPARC M12 and SPARC M12 are identical products.

Fujitsu M10 is sold as SPARC M10 by Fujitsu in Japan. Fujitsu M10 and SPARC M10 are identical products.

Audience

This document is written for experienced system administrators with working knowledge of computer networks and advanced knowledge of the Oracle Solaris.

Related Documentation

All documents for your server are available online at the following locations.

Notes on Safety

Read the following documents thoroughly before using or handling SPARC M12/M10.

- Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 Important Legal and Safety Information
- Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 Safety and Compliance Guide

Text Conventions

This manual uses the following fonts and symbols to express specific types of information.

Font/Symbol	Meaning	Example	
AaBbCc123What you type, when contrasted with on-screen computer output. This font is used to indicate example of command input		XSCF> adduser jsmith	
AaBbCc123	The names of commands, files, and directories; on-screen computer output. This font is used to indicate an example of command output.	XSCF> showuser -P User Name: jsmith Privileges: useradm auditadm	
Italic	Indicates the name of a reference manual, a variable, or userreplaceable text.	See the Fujitsu M10-1/SPARC M10-1 Installation Guide.	
	Indicates the names of chapters, sections, items, buttons, or menus.	See "Chapter 2 Network Connection."	

Command syntax in the text

While the XSCF commands have the section number of (8) or (1), it is omitted from the text. Each command has the section number in a command name when prompting users to refer to it.

Syntax of the Command-Line Interface (CLI)

The command syntax is as follows:

- A variable that requires the input of a value must be put in Italics.
- An optional element must be enclosed in [].
- A group of options for an optional keyword must be enclosed in [] and delimited by |.

Notation of This Manual

Here describes the notation used in this manual.

Intro(1) provides the XSCF shell commands and the brief description of them in the alphabetical order.

Each XSCF shell command is described in the order of sections below. When there's no relevant description provided, the section itself is omitted.

Section	Description
NAME	This section gives the names of the XSCF shell commands, followed by a brief description of what they do.

Section	ection Description	
SYNOPSIS	This section gives the syntax of commands. The use of font style complies with the following rule.	
	bold Enters the command name or the constants as displayed.	
	<i>Italic</i> Substitutes the variables and so forth with the appropriate values when the command executed.	
	The use of symbols such as parenthesis complies with the following rule.	
	[] Brackets. The OPTIONS or OPERANDS enclosed in these brackets can be omitted. Those not enclosed can't be omitted.	
	{ } Braces. The OPTIONS or OPERANDS enclosed in these braces are treated as a unit.	
	Separator. You should specify one of the OPTIONS or OPERANDS delimited with this symbol " ".	
	Ellipsis. You can specify multiple OPTIONS or OPERANDS just before.	
DESCRIPTION	This section gives the detailed description such as the command function. It describes the behavior after the command executed and the content to be displayed. It doesn't describe how to specify the OPTIONS or OPERANDS.	
Privileges	This section gives the privileges required for command execution. In case that what can be executed varies by the user privileges, it is described here.	
OPTIONS	This section gives the meaning of and how to specify the OPTIONS. In case the OPERANDS required for the OPTIONS, it is described here. To specify multiple 1-character OPTIONS, you may specify the first OPTION followed by the alphabetic part of the second.	
	e.g. fmadm -a -i fmadm -ai	
OPERANDS	This section gives the meaning of and how to specify the OPERANDS. The OPERANDS which follows the OPTIONS are described in "OPTIONS."	

Section	Description
EXTENDED DESCRIPTION	This section gives the description in case the supplementary explanation required in addition to the content written in "DESCRIPTION." Also used to divide the description prolonged in "DESCRIPTION."
EXAMPLES	This section gives the examples of command execution. The explanation of examples, the execution command, and the messages returned from the system as a result of execution.
EXIT STATUS	This section gives the status which shows whether or not the command executed normally terminated. "0" for normal termination, and ">0" for abnormal termination.
SEE ALSO	This section gives the related command names.

Documentation Feedback

If you have any comments or requests regarding this document, please take a moment to share it with us by indicating the manual code, manual title, and page, and stating your points specifically through the following websites:

Reference

List of XSCF Commands

NAME | Intro - Displays the list of commands provided by the XSCF firmware.

DESCRIPTION

The Intro page lists the user commands (exit(1), man(1), and who(1)) and the system management commands (all commands starting with addboard(8)), which are provided by the XSCF firmware of the SPARC M12/M10 systems. The XSCF commands include the commands with the same names as ones of Oracle Solaris. However, their usages are not the same. For details, see the man page of each command.

XSCF supports the following commands.

exit	Ends the XSCF shell.
man	Displays the manual page of the XSCF shell command.
who	Displays list of user accounts logged in to XSCF.
addboard	Incorporates or assigns a physical system board (PSB) to a physical partition (PPAR).
addcodactivation	Adds the CPU Activation key to the system.
addfru	Adds the Field Replaceable Unit (FRU) and a chassis.
addpowerschedule	Adds a schedule for powering on/off a physical partition (PPAR).
adduser	Creates an XSCF user account.
addvbootcerts	Adds X.509 public key certificates used for performing Verified Boot of Oracle Solaris.
applynetwork	Applies the contents of the XSCF network to the XSCF.
clearremotepwrmgmt	Deletes the management information of the remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems.
console	Connects to the control domain console.
deleteboard	Releases the physical system board (PSB) from the physical partition (PPAR) configuration.
deletecodactivation	Deletes the CPU Activation key from the system.
deletepowerschedule	Deletes a schedule for powering on/off a physical partition (PPAR).
deleteuser	Deletes an XSCF user account.

Intro(1)

deletevbootcerts	Deletes X.509 public key certificates used for performing Verified Boot of Oracle Solaris.
diagxbu	Diagnoses crossbar cable and crossbar unit (XBU).
disableuser	Disables an XSCF user account.
dumpcodactivation	Saves the CPU Activation key in a file.
dumpconfig	Saves the XSCF configuration information in a file.
enableuser	Enables an XSCF user account.
flashupdate	Updates the firmware.
getflashimage	Downloads a firmware image file.
getremotepwrmgmt	Obtains the setup file of the remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems.
initbb	Detach the SPARC M12-2S/M10-4S and the crossbar box from the system and initialize it to the factory default.
ioxadm	Manages the PCI Expansion unit, and the link card connected to the host server.
nslookup	Refers to the Internet name server for the host name.
password	Sets the password of the XSCF user account and the effective period.
ping	Sends the ECHO_REQUEST packet of ICMP to the host on the network.
poweroff	Shuts down the physical partition (PPAR).
poweron	Starts the physical partition (PPAR).
prtfru	Displays the FRUID data on the system and the PCI Expansion Unit.
rastest	Causes a fault virtually.
rebootxscf	Reboots XSCF.
replacefru	Replaces the Field Replaceable Unit (FRU) and chassis.
reset	Resets the specified physical partition (PPAR) or a logical domain (guest domain).
resetdateoffset	Resets the difference between the system time and the time of each physical partition (PPAR).

restorecodactivation	Restores the CPU Activation key.
restoreconfig	Restores the XSCF configuration information.
restoredefaults	Restores settings of the XSCF unit and its back-up information to the factory default.
sendbreak	Sends a break signal to the control domain of the specified physical partition (PPAR).
setad	Configure Active Directory.
setaltitude	Sets the altitude of the system.
setaudit	Manages the audit function of the system.
setautologout	Sets the session timeout time of XSCF shell.
setcod	Sets up the CPU core resources to be used in physical partitions (PPAR).
setdate	Sets the date and time of the XSCF clock.
setdomainconfig	Specifies the logical domain configuration when the physical partition (PPAR) is started.
setdualpowerfeed	Sets the dual power feed mode.
setemailreport	Sets the e-mail report function.
sethostname	Sets the host names and DNS domain names of the master chassis and chassis whose XSCF is standby.
sethsmode	Enables/Disables the high speed mode of the CPU.
sethttps	Sets the start and halt of the HTTPS service used in the XSCF network. Also it performs authentication-related settings.
sethwproperty	Sets the hardware property.
setinterimpermit	Enables/Disables CPU Activation Interim Permit.
setldap	Configure the Service Processor as a Lightweight Directory Access Protocol (LDAP) client.
setldapssl	Configure LDAP over SSL.
setlocator	Sets the blinking status of the CHECK LED of the operation panel.
setloginlockout	Enables or disables the lockout function when logging in.

setlookup	Enable or disable the use of the Lightweight Directory Access Protocol (LDAP) server for authentication and privilege lookup.
setnameserver	Sets or deletes the name server and search path used in XSCF network.
setnetwork	Sets or deletes the network interface to be used in XSCF.
setntp	Sets the time synchronization for XSCF.
setpacketfilters	Sets the IP packet filtering rules used in the XSCF network.
setpasswordpolicy	Manages the password policy of the system.
setpcl	Sets the physical partition (PPAR) configuration information (PCL).
setpciboxdio	Configures each PCI slot setting of whether to enable the direct I/O function for a PCI card mounted in the PCI expansion unit for the SPARC M12-2/M12-2S/M10-4/M10-4S.
setpowercapping	Sets caps for power consumption.
setpowerschedule	Enables or disables the power schedule of a physical partition (PPAR), or sets the power recovery information.
setpowerupdelay	Sets the warm-up operation time of the system and the wait time for air conditioning.
setpparmode	Sets the operation mode of the physical partition (PPAR).
setpparparam	Execute forced rewriting of OpenBoot PROM environment variables and registration or deletion of boot scripts of the control domain.
setprivileges	Assigns the user privileges.
setremotepwrmgmt	Sets up the remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems.
setremotestorage	Manages connection to remote storage.
setroute	Sets the routing information of the XSCF network interface.
setservicetag	Enables or disables the servicetag agents.

setsmtp	Sets the Simple Mail Transfer Protocol (SMTP)
	service.
setsnmp	Manages the SNMP agent.
setsnmpusm	Sets the User-based Security Model (USM) of the SNMPv3 agent.
setsnmpvacm	Sets the View-based Access Control Model (VACM) settings of the SNMPv3 agent.
setsscp	Assigns the IP address of the SP to SP communication protocol (SSCP).
setssh	Sets Secure Shell (SSH) service used in the XSCF network.
settelnet	Starts or halts Tenet service used in the XSCF network.
settimezone	Sets the time zone and daylight saving time of XSCF.
setupfru	Sets the hardware of devices.
setvbootconfig	Configures the Verified Boot policy of Oracle Solaris and enables/disables X.509 public key certificates used for performing Verified Boot.
showad	Show Active Directory configuration and messages.
showaltitude	Displays the altitude of the system.
showaudit	Displays the current status of the audit system.
showautologout	Displays the session timeout time of the XSCF shell.
showbbstatus	Display the status of the SPARC M12/M10 systems chassis.
showboards	Displays the information of the physical system board (PSB).
showcod	Displays the registered and setup information of CPU Activations.
showcodactivation	Displays the current CPU Activation key information added to the system.
showcodactivationhistory	Displays the logs to add and delete the CPU Activation keys (Capacity on Demand (CoD) logs).

Intro(1)

showcodusage	Display the usage information of CPU core resources.
showconsolepath	Displays the information of the domain console that is currently connected to the physical partition (PPAR).
showdate	Displays the date and time of the XSCF clock.
showdateinfo	Displays the dates and times of the XSCF and logical domains.
showdateoffset	Displays the difference between the system time and the time of each physical partition (PPAR).
showdomainconfig	Displays the configuration information of the logical domain of the specified physical partition (PPAR).
showdomainstatus	Displays the status of the current logical domain.
showdualpowerfeed	Displays the status of dual power feed mode.
showemailreport	Displays the settings data of the e-mail report.
showenvironment	Displays the intake-air temperature, temperature sensor information, voltage sensor information, and fan rotation information of the system.
showfru	Displays the contents of settings regarding the hardware devices.
showhardconf	Displays the information of the Field Replaceable Unit (FRU) mounted on the server.
showhostname	Displays the host names set in the master chassis and chassis whose XSCFs are standby.
showhsmode	Displays the setting of the high speed mode of the CPU.
showhttps	Displays the status of the HTTPS service set in the XSCF network.
showhwproperty	Displays the hardware property settings.
showinterimpermit	Displays the status and information about CPU Activation Interim Permit.
showinterimpermitusage	Displays information about CPU Activations and CPU core resources.
showldap	Display the Lightweight Directory Access Protocol (LDAP) configuration for the Service Processor.

l

showldapssl	Show LDAP over SSL configuration and messages.
showlocator	Displays the status of the CHECK LED on the operation panel.
showloginlockout	Displays the time set in the lockout function of the user account.
showlogs	Displays the specified log.
showlookup	Display the configuration for authentication and privileges lookup.
showmonitorlog	Displays the contents of the monitoring message log in real time.
shownameserver	Displays the name server and the search path set in the XSCF network.
shownetwork	Displays the information of the network interface set in the XSCF.
shownotice	Displays copyright and license information for the XSCF Control Package (XCP).
showntp	Displays the NTP information set in the XSCF network.
showpacketfilters	Displays the IP packet filtering rule set in the XSCF network.
showpasswordpolicy	Displays the current password policy setting.
showpciboxdio	Displays each PCI slot setting of whether to enable the direct I/O function for a PCI card mounted in the PCI expansion unit for the SPARC M12-2/M12- 2S/M10-4/M10-4S.
showpcl	Displays the physical partition (PPAR) configuration information (PCL) that is currently set.
showpowercapping	Displays the status of power capping.
showpowerschedule	Displays the schedule operation information.
showpowerupdelay	Displays the warm-up time and wait time for air conditioning of the system that is currently set.
showpparinfo	Display the resource information of the physical partition (PPAR).
showpparmode	Displays the operation mode of the physical partition (PPAR) that is currently set.

showpparparam	Displays the OpenBoot PROM environmental variable and the boot script of the control domain which will be set at the subsequent startup of the specified physical partition (PPAR).
showpparprogress	Shows the detailed status of the physical partition (PPAR) in the middle of power control sequence.
showpparstatus	Displays the status of the current physical partition (PPAR).
showremotepwrmgmt	Displays the setup of remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems and the power status of the node.
showremotestorage	Displays information on remote storage.
showresult	Displays the end status of the previously executed command.
showroute	Displays the routing information set in the XSCF network interface.
showservicetag	Displays whether the servicetag agents are currently enabled or disabled.
showsmtp	Displays the settings information of the Simple Mail Transfer Protocol (SMTP).
showsnmp	Displays the settings information and the current status of the SNMP agent.
showsnmpusm	Displays the current User-based Security Model (USM) information regarding the SNMP agent.
showsnmpvacm	Displays the current View-based Control Access (VACM) information regarding the SNMP agent.
showsscp	Displays the IP address assigned to the SP to SP communication protocol (SSCP).
showssh	Displays the contents of the Secure Shell (SSH) service set in the XSCF network.
showstatus	Displays the degraded Field Replaceable Unit (FRU).
showtelnet	Displays the status of the Telnet service set in the XSCF network.
showtimezone	Displays the currently set time zone of the XSCF and the daylight saving time information.

showuser	Displays the XSCF user account information.
showvbootcerts	Displays the information of X.509 public key certificates setup at each physical partition (PPAR), that are used for performing Verified Boot of Oracle Solaris.
showvbootconfig	Displays the Verified Boot policy of Oracle Solaris and the enable/disable configuration of the X.509 public key certificates that are used for performing Verified Boot.
snapshot	Collects and transfers the data regarding environment, logs, errors, and Field Replaceable Unit Identifier (FRUID).
switchscf	Switches the status of XSCF in between master and standby.
testsb	Performs an initial diagnosis on the specified physical system board (PSB).
traceroute	Displays the network route to the specified host.
unlockmaintenance	Release multi-activated lock created by addfru(8) and replacefru(8).
version	Displays the version number of the firmware.
viewaudit	Displays the audit record.
xscfstartupmode	Set up the startup mode of SPARC M12-1/M10-1.

Reference

User Commands

NAME	exit - Ends the XSCF shell.
SYNOPSIS	exit
DESCRIPTION	exit is a command to end and close the XSCF shell.
Privileges	No privileges are required to execute this command.
	For details on user privileges, see setprivileges(8).

exit(1)

NAME	man - Displays t	he manual page of the XSCF shell command.	
SYNOPSIS	man command_name		
	man -h		
DESCRIPTION	man is a command to display the manual page of the specified XSCF shell command.		
Privileges	No privileges are required to execute this command.		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
OPERANDS	The following op	The following operands are supported.	
	command_name	Specify the command to display the manual page. You can make multiple specifications by separating them with spaces.	
		With "Intro" specified in <i>command_name</i> , the list of the XSCF shell commands is displayed.	
EXTENDED DESCRIPTION	If the manual page is long, it is divided by each screen for display. In this case, you can make an operation like the following using keys.		
	Key	Description	
	[Enter]	Displays the next one line.	
	Space	Displays the next one page.	
	[b]	Returns by half-page.	
	[q]	Interrupts the display of the manual page.	
	To display a mar	n page, set TERM=vt100 for the terminal software.	
EXAMPLES	EXAMPLE 1 Displ	ay the manual page of addboard(8).	
	XSCF> man add	lboard	
	EXAMPLE 2 Displ	ay the list of the XSCF shell commands.	
	XSCF> man Int	ro	
l			

man(1)

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	

NAME	who - Displays list of user accounts logged in to XSCF.	
SYNOPSIS	who	
	who -h	
DESCRIPTION	who is a command to display list of user accounts logged in to XSCF.	
	The following information is displayed.	
	 XSCF user account name 	
	Terminal in use	
	Idle timeLogin time	
	 Remote host name 	
Privileges	No privileges are required to execute this command.	
C C	For details on user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.	
	-h Displays the usage. Specifying this option with another option or operand causes an error.	
EXAMPLES	EXAMPLE 1 Display the list of user accounts logged in to XSCF.	
	XSCF> who	
	USER TTY IDLE TIME HOST Sxf pts/0 00:00 Jul 17 05:29:11 jjjj.gggg.fujitsu.com

System Administration Commands

NAME	addboard - Incor partition (PPAR)	porates or assigns a physical system board (PSB) into a physical .	
SYNOPSIS	addboard [[-q] -{y n}][-f][-v][-c configure][[-m function=mode]] -p ppar_id psb [psb]		
	addboard [[-q]-{y n}] [-f]-cassign-p ppar_id psb [psb]	
	addboard [[-q]-{y n}] [-f] -c reserve -p ppar_id psb [psb]	
	addboard -h		
DESCRIPTION		ommand to incorporate or to assign a physical system board (PSB) artition (PPAR) according to the PPAR configuration information	
	A physical system	m board (PSB) means one building block (BB).	
	The addboard c	ommand is not available on SPARC M12-1/M12-2/M10-1/M10-4.	
	You can specify any of the following incorporation methods.		
	configure	Incorporates a PSB into the specified PPAR. The incorporated PSB can be assigned to a logical domain. If the PPAR is powered off, or if the Oracle Solaris of the control domain is not running, the PSB is not incorporated, and it causes an error.	
	assign	Assigns a PSB to the specified PPAR. The assigned PSB is reserved for the specified PPAR, so the PSB cannot be incorporated in or assigned to any other PPAR. After assigning the PSB, the PSB is incorporated into the PPAR when the system is restarted or addboard with -c configure is executed.	
	reserve	Reserves incorporation of a PSB into the specified PPAR. The operation is the same as when -c assign is executed.	
Privileges	To execute this c	ommand, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	

addboard(8)

OPTIONS	The following options are supported.		
	-c assign	Assigns a PSB to PPAR configuration. If you omit the -c option, -c configure is assumed specified.	
	-c configure	Incorporates a PSB in PPAR configuration. If you omit the $-c$ option, $-c$ configure is assumed specified.	
	-c reserve	Reserves incorporation of a PSB into the specified PPAR. The operation is the same as when $-c$ assign is executed.	
	-f	Incorporates a PSB in PPAR forcibly.	
		Caution – If a PSB is forcibly added to PPAR by specifying the –f option, all the added hardware resources may not run normally. For this reason, we recommend that users do not use the –f option during normal operation. If you specify the –f option, be sure to check the conditions of the added PSB and other devices.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	

L

-m function=mode	Set up the operation mode and its value. Several functions can		
-	be set up at the same time. If the -m is omitted, the default value		
	will take effect. Specify the operation mode to <i>function</i> . Any of		
	the following can be specified.		

	bind	Set up the automatic assignment of resources feature (enable / disable) for the resources that will be added due to the incorporation of a PSB. If resources were deleted with the deleteboard(8) before executing the addboard and the automatic assignment of resources feature was enabled, the resources on the system will revert back to the state before executing the deleteboard(8). However, if the logical domain configuration was changed before executing the addboard, resources will be assigned in accordance with the changed logical domain configuration.	
	diag	Set up the hardware diagnosis level at the time of incorporation of a PSB to a PPAR configuration.	
	When bind is specified to <i>function</i> , any of the following can be specified to <i>mode</i> . The default is resource.		
	resource	Enable the automatic assignment of resources feature.	
	none	Disable the automatic assignment of resources feature. The added resources will be designated as free resources on the specified PPAR.	
	When diag is specified to <i>function</i> , any of the following can be specified to <i>mode</i> . The default is min.		
	off	Do not execute hardware diagnosis.	
	min	Set up hardware diagnosis level to normal.	
-n	Automatically responds to prompt with "n" (no).		
-p ppar_id	Specifies PPAR-ID to which a PSB is incorporated or assigned. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .		
-d	Prevents display of output.	f messages, including prompt, for standard	

addboard(8)

OPERANDS	-v -y The following op	incorporation. Ign On the SPARC M1 progress report ev	progress report of the processing of PSB ored when executed along with the -q. 2-2S, the command outputs a detailed en if this option is omitted. ponds to prompt with "y" (yes).
	psb	assigned. You can	number of the PSB to be incorporated or make multiple specifications by separating The specification format is below. Specifies the BB-ID which is an integer from 00 to 15. It is fixed to 0.
EXTENDED DESCRIPTION	 y It is fixed to 0. When you specify -c configure, a hardware diagnostic on the PSB is performed before the PSB is incorporated in PPAR. Therefore, it may tal execute the command. When you use addboard to assign or incorporate a PSB, you have to see by using setpc1(8). If you execute a command while the PPAR is in power-on or power-of processing, the system enters in busy state. Execute the command again PPAR processing is completed. For details on PCL, see setpc1(8) and showpc1(8). Even if the PPAR is not running, you can execute addboard. However specify -c configure while the PPAR is running to execute addboard Domains (LDoms) Manager needs to be running. If the PPAR DR feature is disabled, addboard -c configure cannot 1 executed when the PPAR is running. Please refer to setpparmode(8) a showpparmode(8) for details on the PPAR DR feature. If CPU Activation error occurs in a PPAR, addboard -c configure cannot a state before executing the deleteboard(8). If the amount of CPU, me I/O device resources differ after the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is resources in the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is resources in specifier after the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is resources in specifier after the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is resources in specifier after the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is specifier after the replacement, the allocation status resources cannot be reverted back to the previous state. If the assignment is specifier after the replacement is the logical domain. 		borated in PPAR. Therefore, it may take time to a or incorporate a PSB, you have to set the PCL the PPAR is in power-on or power-off isy state. Execute the command again after the and showpc1(8). You can execute addboard. However, if you PAR is running to execute addboard, Logical s to be running. d, addboard -c configure cannot be ng. Please refer to setpparmode(8) and he PPAR DR feature. a PPAR, addboard -c configure cannot be ng. cd is executed without -m or if it is executed board(8). If the amount of CPU, memory or he replacement, the allocation status of the to the previous state. If the assignment of to the previous state, the resources will be uch a case, use the 1dm command of Oracle VM

 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.

EXAMPLES EXAMPLE 1 Assign PSB 00-0, 01-0, 02-0, and 03-0 to PPAR-ID 0.

NAME	addcodactivation - Adds the CPU Activation key to the system.		
SYNOPSIS	addcodactivation [[-q] - {y n}] key_signature		
	addcodactivation [[-q]-{y n}][-u user][-p proxy[-t proxy_type]]-F url		
	addcodactivatio	n [-V] [-{y n}] [-u user] [-p proxy [-t proxy_type]] -F url	
	addcodactivatio	n -h	
DESCRIPTION	addcodactiva SPARC M12/M1	tion is a command to add the specified CPU Activation key to the 10 systems.	
	For obtaining th	xecuting this command, you need to obtain the CPU Activation key. e CPU Activation key, see the <i>Fujitsu SPARC M12 and Fujitsu M10/</i> tem Operation and Administration Guide.	
Privileges	To execute this o	command, platadm privilege is required.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-F url	Specifies URL that the CPU Activation key(s) are included. The following types of format are supported.	
		Specify an absolute path for a file.	
		<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-t proxy_type	Specifies the proxy type. Specify it with the $-p$ option. You can specify any of http, socks4, and socks5. The default is http.	

	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.
	-V	Displays detailed network activities. This option is used to diagnose network and server problems. It cannot be used with the -q.
	-У	Automatically responds to prompt with "y" (yes).
OPERANDS	The following operands are supported.	
	key_signature	Specifies the CPU Activation key to be added to the XSCF. Enclose the CPU Activation key in double quotation marks (") for specification.
EXTENDED DESCRIPTION		tte the command, a prompt to confirm whether to execute it with atents is displayed. To execute, press the [y] key. To cancel, press the
EXAMPLES	EXAMPLE 1 Add	the copied CPU Activation key in SPARC M10-1.
	<pre>XSCF> addcodactivation "Product: SPARC M10-1 SequenceNumber: 116 Cpu noExpiration 2 Text-Signature-SHA256-RSA2048: SBxYBSmB32E1ctOidgWV09nGFnWKNtCJ5N3WSlowbRUY1VVySvjncfOrDNteFLzo : : 1TSgrjnee9FyEYITT+ddJQ==" Above Key will be added, Continue?[y n]: y</pre>	
	EXAMPLE 2 Add	the copied CPU Activation key in SPARC M12-2S.
		1 5
	SequenceNum Cpu noExpira Text-Signatu SBxYBSmB32E1 : :	ation 1 are-SHA256-RSA2048: LctOidgWV09nGFnWKNtCJ5N3WSlowbRUYlVVySvjncfOrDNteFLzo
	SequenceNumb Cpu noExpira Text-Signatu SBxYBSmB32E1 : : 1TSgrjnee9F3	per: 116 ntion 1 nre-SHA256-RSA2048:
	SequenceNumb Cpu noExpira Text-Signatu SBXYBSmB32E1 : : 1TSgrjnee9Fy Above Key wil	per: 116 htion 1 hre-SHA256-RSA2048: hctOidgWV09nGFnWKNtCJ5N3WSlowbRUYlVVySvjncfOrDNteFLzo rEYITT+ddJQ=="

	Above Key will be added, Continue?[y n]: Y done.
	successfully added Activation Key count : 10.
	EXAMPLE 4 Add CPU Activation keys individually from the CPU Activation key file, specified with the URL.
	XSCF> addcodactivation -F file:///media/usb_msd/cod_key_M10- 1_116.txt
	Above Key will be added, Continue?[y n]: Y done. successfully added Activation Key count : 1.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	deletecodactivation(8), dumpcodactivation(8), restorecodactivation(8), setcod(8), showcod(8), showcodactivation(8), showcodactivationhistory(8), showcodusage(8)

addcodactivation(8)

NAME	addfru - Adds the Field Replaceable Unit (FRU) and a chassis.		
SYNOPSIS	addfru		
	addfru -h		
DESCRIPTION	addfru is a command to add the FRU and a chassis.		
	It enables settings required for expansions, such as selecting, confirming, or inserting the FRU or a chassis, interactively by using menu format.		
	The following FRU and chassis can be added by addfru.		
	■ SPARC M10-1/M10-4		
	 Power supply unit for the SPARC M10-1/M10-4 (BB/PSU) 		
	■ SPARC M10-4S		
	 SPARC M10-4S (BB) 		
	 Power supply unit for the SPARC M10-4S (BB/PSU) 		
	 Power supply unit for the crossbar box (XB-Box/PSU) 		
	■ SPARC M12-1/M12-2		
	 Power supply unit for the SPARC M12-1/M12-2 (BB/PSU) 		
	SPARC M12-2S		
	• SPARC M12-2S (BB)		
	 Power supply unit for the SPARC M12-2S (BB/PSU) Percent supply unit for the superbanker (XB Barry (BSU)) 		
	 Power supply unit for the crossbar box (XB-Box/PSU) 		
Privileges	To execute this command, the fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	 According to the implementation status and the state of the chassis of the FRU which is to be added, the addition operation may not be executed. In such a case, when the target FRU or chassis is selected, an error message, stating that the operation cannot be executed, is output. 		
	In the following conditions, addition of FRUs is not possible.		
	 Common to all FRUs and chassis 		
	The target chassis (if the target is a FRU, then the chassis on which the FRU is mounted) is in any of the following states.		

	- In the middle of firmware updating
	- Not in the state of "SCF READY"
	- Has already been recognized by the system
	 PSU for the SPARC M12-2S/M10-4S and crossbar box
	Implemented by default if not applicable to all FRUs and chassis.
	 SPARC M12-2S/M10-4S
	- IP address is not setup to the SSCP link of the target SPARC M10-4S using the $setsscp(8)$
	- If there is a chassis which has the same BB-ID as the target SPARC M10-4S, and was implemented in a system before (unless it was removed by the initbb(8))
	- The selected chassis cannot be connected due to system configuration
	 In case of SPARC M12-2S/M10-4S, if the chassis information such as the serial number, in respect to the selected BB-ID, has already been registered in the system, an error message is output and adding with the addfru becomes impossible. In such a case, use the replacefru(8) to replace the parts.
	 The addfru can only be executed on the master XSCF. If it is executed on the standby XSCF, an error is output.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	addpowerschedu (PPAR).	le - Adds a schedule for powering on/off a physical partition		
SYNOPSIS	addpowerschedule {-p <i>ppar_id</i> -a} -m daily {on= ontime off= offtime ontime off= offtime} term=value			
		<pre>le {-p ppar_id -a} -m weekly {on= ontime off= offtime on= me} pattern= week term= value</pre>		
	addpowerschedule {-p <i>ppar_id</i> -a} -m monthly {on= ontime off= offtime on= ontime off= offtime} pattern= value term= value			
	addpowerschedule {-p <i>ppar_id</i> -a} -m special {on= ontime off= offtime on= ontime off= offtime} date= value			
	addpowerschedu	<pre>lle {-p ppar_id -a} -m holiday date= value</pre>		
	addpowerschedule -h			
DESCRIPTION	addpowerschedule is a command to add a schedule for powering on/off a PPAR			
Privileges	To execute this command, either of the following privileges is required.			
	platadm	Enables execution for all PPARs.		
	pparadm	Enables execution for PPARs for which you have administration privilege.		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following op	tions are supported.		
	-a	Sets a power schedule for all PPARs.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-m daily	Adds a power schedule to be repeated daily.		
	-m weekly	Adds a power schedule to be repeated weekly.		
	-m monthly	Adds a power schedule to be repeated monthly.		
	-m special	Adds a one-shot power schedule.		
	-mholiday	Adds a pause of scheduled operation.		
	-p ppar_id	Specifies PPAR-ID for setting a schedule. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .		

on= <i>ontime</i>	Sets a time to power on. To specify <i>ontime</i> , use the <i>hhm</i> 0 format.		
	hh	Specifies hours (in 24 hour format).	
	<i>m</i> 0	Specifies minutes (in 10 minute format).	
off=offtime	Sets a time to po	wer off. To specify <i>offtime</i> , use the <i>hhm</i> ⁰ format.	
	hh	Specifies hours (in 24 hour format).	
	<i>m</i> 0	Specifies minutes (in 10 minute format).	
term= <i>value</i>	daily, use value	Sets a period of conducting the scheduled operation. To specify daily, use <i>value</i> by using <i>MMDD-mmdd</i> format. To specify <i>value</i> for weekly and monthly schedule, use the <i>MM-mm</i> format.	
	ММ	Specifies the starting month.	
	DD	Specifies the starting day.	
	mm	Specifies the ending month.	
	dd	Specifies the ending day.	
pattern=week	Sets the day of the week for conducting weekly scheduled operation. To specify <i>week</i> , use the following formats. To specify more than one day of the week, separate them by inserting a comma (,) between them.		
	sun	Specifies Sunday.	
	mon	Specifies Monday.	
	tue	Specifies Tuesday.	
	wed	Specifies Wednesday.	
	thu	Specifies Thursday.	
	fri	Specifies Friday.	
	sat	Specifies Saturday.	
patern=value	 Specifies the date for conducting monthly scheduled opera To specify <i>value</i>, use the <i>DD-dd</i> format. 		
	DD	Specifies the starting day.	
	dd	Specifies the ending day.	

	date=value	Specifies the date, month, and year for conducting or suspending a one-shot schedule or a pause of scheduled operation. To specify <i>value</i> , use the <i>YYMMDD</i> format.		
		ΥY	Specifies the last two digits of year (2000-2037).	
		MM	Specifies a month.	
		DD	Specifies a day.	
EXTENDED DESCRIPTION	scheduled ope	verschedule(8) is added to enable the schedule of PPAR-ID, the erations are conducted. However, if the mode switch on the el is set to Service, the operations are not conducted.		
	 By using show checked. 	vpowerschedule(8)), the contents of the added schedule can be	
	• To delete the a	ndded schedule, use	deletepowerschedule(8).	
	 If non-existent abnormally. 	<i>ppar_id</i> or time, or	past date or invalid option is specified, it ends	
	■ Up to 4096 sch	hedules can be specified in the entire system.		
	 If two or more the following 	e schedules are set at the same time, they are conducted in order of priority.		
	1. Pause of schee	dule (special)		
	2. One-shot sche	dule (holiday)		
	3. Monthly sched	ule (monthly)		
	4. Weekly schedu	ule (weekly)		
	5. Daily schedule	e (daily)		
		nd power-off schedu ring off is conducted	le are set at the same time in the same order of d.	
	add-spconfi configuration	nanged the configuration of the logical domain, execute the ldm Eig command on the control domain, to store the latest n information in XSCF. If you do not store the information, the ower-off processing may fail to work properly.		
EXAMPLES		a schedule of PPAR-I 9:00 to 21:30 daily.	D 1 that operates from January 1 to December 31,	
	XSCF> addpowe 1231 XSCF>	erschedule -p 1 -	m daily on=0900 off=2130 term=0101-	

EXAMPLE 2 Add a schedule of PPAR-ID 1 that operates from February to April, from 7:10 to 19:50 on every Monday, Tuesday, Wednesday, Thursday, and Friday.

```
XSCF> addpowerschedule -p 1 -m weekly on=0710 off=1950
pattern=mon,tue,wed,thu,fri term=02-04
XSCF>
```

EXAMPLE 3 Add a schedule of PPAR-ID 1 that operates from first to fifth of May to June, from 9:20 to 18:40 daily.

```
XSCF> addpowerschedule -p 1 -m monthly on=0920 off=1840 pattern=01-
05 term=05-06
```

```
XSCF>
```

EXAPLE 4 Add a schedule of PPAR-ID 1 that operates only on March 4, 2013 from 0:00 to 23:50.

XSCF> addpowerschedule -p 1 -m special on=0000 off=2350 date=130304
XSCF>

EXAMPLE 5 Cancel the schedule of PPAR-ID 1 set to May 4, 2013.

```
XSCF> addpowerschedule -p 1 -m holiday date=130504
XSCF>
```

EXAMPLE 6 Add a schedule of PPAR-ID 1 that is turned on at 7:10 on every Monday and turned off at 19:50 on every Friday from June to August.

```
XSCF> addpowerschedule -p 1 -m weekly on=0710 pattern=mon term=06-
08
XSCF> addpowerschedule -p 1 -m weekly off=1950 pattern=fri term=06-
08
```

```
XSCF>
```

EXAMPLE 7 Add a schedule of PPAR-ID 1 that operates from December 1 to March 1 of the next year, from 6:00 to 22:00 daily.

```
XSCF> addpowerschedule -p 1 -m daily on=0600 off=2200 term=1201-
0301
XSCF>
```

	EXAMPLE 8 Add a schedule of PPAR-ID 1 that is turned on at 8:00 on 1st of every month from November to February of the next year and turned off at 20:00 on 29th of every month.
	XSCF> addpowerschedule -p 1 -m monthly on=0800 pattern=01-01 term=11-02
	XSCF> addpowerschedule -p 1 -m monthly off=2000 pattern=29-29 term=11-02 XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	deletepowerschedule (8), setpowerschedule (8), showpowerschedule (8)

addpowerschedule(8)

NAME	adduser - Creates an XSCF user account.			
SYNOPSIS	adduser [-u UID] user			
	adduser -h			
DESCRIPTION	adduser is a command to create a new XSCF user account.			
	An XSCF user account is used for configuring, manipulating, managing, and operating XSCF. No password is set to the newly created user account. Therefore, set a password by using password(8), or set the public key for users by using Secure Shell (SSH). Otherwise, you cannot log in. The created user account is locked but not disabled. The number of user accounts to be specified is up to 100 assuming that a user account contains 10 characters on average.			
	When Lightweight Directory Access Protocol (LDAP), Active Directory, or LDAP over SSL is set to be used for the user account data on XSCF, the user account name and the user identifier (if specified) must be the one that is not used for XSCF, LDAP, Active Directory, or LDAP over SSL.			
	When you create a user account, the current value of the password policy is saved in the file for the created user account. For details on password policy, see setpasswordpolicy(8).			
Privileges	To execute this command, useradm privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-u UID	UID Creates a new user with the specified identifier (UID). For specifying <i>UID</i> , use an integer between 100 and 60000. If you omit the -u option, an integer greater than or equal to 100 is automatically assigned as a user identifier.		
OPERANDS	The following operands are supported.			
	user	Specifies the XSCF user account name to be created. For specifying a user account name, use up to 31 characters in combination of lowercase alphabets, numbers, hyphens (-), and underscores (_). No uppercase characters are available. Be sure to use a lowercase alphabet for the first character. The examples of user account name available are jsmith, j_smith, and j_smith-0123.		

adduser(8)

EXAMPLES	EXAMPLE 1 Create a new user.		
	XSCF> adduser -u 359 jsmith		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

addvbootcerts(8)

	-p ppar_id	Specifies the PPAR-ID of the PPAR to which the X.509 public key certificate is to be added.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-t proxy_tı	<i>ppe</i> Specifies the proxy type. Specify it with the -p option. You can specify any of http, socks4, and socks5. The default is http.	
	-u <i>usernam</i>	 Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters. 	
	-V	Displays detailed network activities. This option is used to diagnose network and server problems. It cannot be used with the $-q$ option.	
	–X proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.	
	-У	Automatically responds to prompt with "y" (yes).	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
OPERANDS	The follow:	ng operands are supported.	
	certname	Specifies the name of the certificate. It is not necessary for it being the same as the file name, but it must be unique within the PPAR. Moreover, it should consist of alphanumeric characters, hyphens or underscores only and no more than 32 characters. The first character should be an alphabetical character.	
	signature	Adds the copied X.509 public key certificate. The value should be surrounded by a pair of double quotations (" ").	
EXAMPLES	EXAMPLE 1	Add the copied X.509 public key certificate as " CUSTOM_CERT_1" to PPAR-ID 0.	
	<pre>XSCF> addvbootcerts -p 0 CUSTOM_CERT_1 "BEGIN CERTIFICATE MIIFEzCCA/ugAwIBAgIQB62zBpmCOdvdYEFEcb4/cTANBgkqhkiG9w0BAQUFADCB njELMAkGA1UEBhMCVVMxGzAZBgNVBAoTEk9yYWNsZSBDb3Jwb3JhdGlvbjEfMB0G A1UECxMWVmVyaVNpZ24gVHJ1c3QgTmV0d29yazE1MDMGA1UECxMsQ2xhc3MgMiBN : GuygEAGV+A== END CERTIFICATE" The above elfsign X.509 key certificate will be added to PPAR-ID 0, Continue?[y n]:</pre>		

```
EXAMPLE 2 Add the copied X.509 public key certificate as "CUSTOM_CERT_3" to PPAR-
                           ID 2. Answer "y" to the confirmation message.
                  XSCF> addvbootcerts -p 2 CUSTOM CERT 3 "----BEGIN CERTIFICATE----
                  MIIFEzCCA/ugAwIBAgIQB62zBpmCOdvdYEFEcb4/cTANBgkqhkiG9w0BAQUFADCB
                  njELMAkGA1UEBhMCVVMxGzAZBgNVBAoTEk9yYWNsZSBDb3Jwb3JhdG1vbjEfMB0G
                  A1UECxMWVmVyaVNpZ24gVHJ1c3QgTmV0d29yazE1MDMGA1UECxMsQ2xhc3MgMiBN
                  GuygEAGV+A==
                  -----END CERTIFICATE-----"
                  The above elfsign X.509 key certificate will be added to PPAR-ID 2,
                  Continue?[y n]:y
                  .... done.
                  successfully added this certificate to PPAR-ID 2 as index 3.
                 EXAMPLE 3 Add the X.509 public key certificate specified in the URL as "customcert3" to
                           PPAR-ID 4. Answer "y" to the confirmation message.
                  XSCF> addvbootcerts -p 4 customcert3 -F
                  file:///media/usb_msd/vboot/3rd_perty_cert_xyz
                  The above elfsign X.509 key certificate will be added to PPAR-ID 4,
                  Continue?[y|n]:y
                  .... done.
                  successfully added this certificate to PPAR-ID 4 as index 3.
                 EXAMPLE 4 An error occurs when an attempt is made to add certificates inspite of the fact
                            that the highest possible number of X.509 public key certificates have already
                           been registered.
                  XSCF> addvbootcerts -p 6 CUSTOM CERT 6 -F
                  file:///media/usb_msd/vboot/3rd_perty_cert_xyz
                  Exceeded the number of certificates that can be registered to PPAR-ID 6.
EXIT STATUS
                The following exit values are returned.
                 0
                                  Indicates normal end.
                                  Indicates error occurrence.
                 > 0

NAME	applynetwork - Applies the contents of the XSCF network to XSCF.		
SYNOPSIS	applynetwork [[-q] - {y n}] [-M]		
	applynetwork -h		
DESCRIPTION	applynetwork is a command to apply the configured contents of the XSCF network to XSCF.		
	Use the following	g three procedures to configure contents of the XSCF network.	
	1. Use the follow	ring command to configure a network.	
	 Use sethor 	stname(8) to set the XSCF host name and DNS domain name.	
	 Use setnar 	meserver(8) to set the name server and the search path.	
	 Use setne 	twork(8) to set the IP address and netmask of XSCF-LAN.	
	 Use setror 	ute(8) to set a routing of the XSCF network interface.	
	 Use setss 	cp(8) to set the IP address of SSCP.	
	2. Execute apply	metwork to apply the configured contents to XSCF.	
	3. Execute rebootxscf(8) to reboot all XSCF based on the applied contents.		
	Note – If you reboot XSCF without executing applynetwork, the configured contents of the network is not applied. Not only that but the configured contents are erased.		
Privileges	To execute this command, platadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	
	-n	Automatically responds to prompt with "n" (no).	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with contents is displayed. To execute, press the [y] key. To cancel, press	

- For applying the XSCF network, the IP address and netmask of XSCF-LAN must be configured. If they are configured correctly, the configuration of the XSCF network cannot be applied.
- On a SPARC M12-2S/M10-4S, if the XSCF-LAN in up state is configured as described below, it causes an error. Use setnetwork(8) to correct the settings.
 - The subnets of xbbox#80-lan#0, xbbox#81-lan#0, and takeover IP address lan#0 are all different.
 - The subnets of xbbox#80-lan#1, xbbox#81-lan#1, and takeover IP address lan#1 are all different.
 - Any of the subnets of xbbox#80-lan#0, xbbox#80-lan#1, and SSCP link is overlapped.
 - Any of the subnets of xbbox#81-lan#0, xbbox#81-lan#1, and SSCP link is overlapped.
 - Any of the subnets of xbbox#80-lan#0, xbbox#81-lan#1, and SSCP link is overlapped.
 - Any of the subnets of xbbox#81-lan#0, xbbox#80-lan#1, and SSCP link is overlapped.
 - The subnets of bb#00-lan#0, bb#01-lan#0, and takeover IP address lan#0 are all different.
 - The subnets of bb#00-lan#1, bb#01-lan#1, and takeover IP address lan#1 are all different.
 - Any of the subnets of bb#00-lan#0, bb#00-lan#1, and SSCP link is overlapped.
 - Any of the subnets of bb#01-lan#0, bb#01-lan#1, and SSCP link is overlapped.
 - Any of the subnets of bb#00-lan#0, bb#01-lan#1, and SSCP link is overlapped.
 - Any of the subnets of bb#01-lan#0, bb#00-lan#1, and SSCP link is overlapped.
 - The IP address of the slave XSCF network interface that is used with remote storage is overlapped.
- If the subnets of bb#00-lan#0 and bb#00-lan#1 which are in up state on SPARC M12-1/M12-2/M10-1/M10-4, it causes an error. Use setnetwork(8) to correct the settings.
- If the total number of characters of the DNS domain name specified with sethostname(8) and the search path specified with setnameserver(8) exceeds 256, it causes an error.
- If the IP address of the SSCP link is not set for all the SPARC M12/M10 systems chassis or crossbar boxes, it causes an error. Use setsscp(8) to correct the settings.
- If an IP address that is not included in any XSCF-LAN exists in the gateway address of the routing information, it causes an error. Use setroute(8) to correct the settings.

	 If the IP address of the destination of the routing information and the subnet of the SSCP link are overlapped, it causes an error. Use setsscp(8) to correct the settings. 		
	 If the IP address of the slave XSCF network interface that is used with remote storage overlaps with the IP address of SSCP link, it causes an error. Use setsscp(8) to correct the settings. 		
	 If the IP address of the slave XSCF network interface that is used with remote storage overlaps with any subnet of the SSCP link that includes the slave XSCF, it causes an error. Use setsscp(8) to correct the settings. 		
	 When the system is configured with multiple XSCFs, do not execute applynetwork during an XSCF failover. 		
EXAMPLES	EXAMPLE 1 Apply the following network settings after rebooting the XSCF in the SPARC M12-2S/M10-4S with the building block configuration (without crossbar box).		
	■ Host name (bb#00): hostname-0		
	 Host name (bb#01): hostname-1 		
	 DNS domain name: example.com 		
	■ Name server: 10.23.4.3		
	 Interface: Enables bb#00-lan#0 at a start. 		
	■ IP address (bb#00-lan#0): 10.24.144.214		
	Netmask (bb#00-lan#0): 255.255.255.0		
	 Routing (default gateway): 10.24.144.1 		
	 Interface: Enables bb#01-lan#0 at a start. 		
	■ IP address (bb#01-lan#0): 10.24.144.215		
	■ Netmask (bb#01-lan#0): 255.255.255.0		
	 Routing (default gateway of bb#01-lan#0): 10.24.144.1 		
	 IP address (SSCP): From 192.168.1.1 to 192.168.1.4, from 192.168.1.9 to 192.168.1.12, from 192.168.1.17 to 192.168.1.18 		
	■ Netmask (SSCP): 255.255.255.248, 255.255.255.248, and 255.255.255.252		
	■ IP address of slave XSCF (bb#02-lan#0): 10.24.144.216		
	 Netmask of slave XSCF (bb#02-lan#0): 255.255.255.0 		
	 Default gateway of slave XSCF (bb#02-lan#0): 10.24.144.1 		
	<pre>XSCF> applynetwork The following network settings will be applied: bb#00 hostname :hostname-0 bb#01 hostname :hostname-1 DNS domain name :example.com nameserver :10.23.4.3</pre>

EXAMPLE 2 Apply the following network settings after rebooting the XSCF in the SPARC M12-2S/M10-4S with the building block configuration (with crossbar box).

- Host name (xbbox#80): hostname-0
- Host name (xbbox#81): hostname-1
- DNS domain name: example.com
- Name server: 10.23.4.3
- Interface: Enables xbbox#80-lan#0 at a start.

- IP address (xbbox#80-lan#0): 10.24.144.214
- Netmask (xbbox#80-lan#0): 255.255.255.0
- Routing (default gateway): 10.24.144.1
- Interface: Enables xbbox#81-lan#0 at a start.
- IP address (xbbox#81-lan#0): 10.24.144.215
- Netmask (xbbox#81-lan#0): 255.255.255.0
- Routing (default gateway of xbbox#81-lan#0): 10.24.144.1
- IP address (SSCP): From 192.168.1.1 to 192.168.1.17, from 192.168.2.1 to 192.168.2.17, from 192.168.3.1 to 192.168.3.4, from 192.168.4.1 to 192.168.4.4, and from 192.168.5.1 to 192.168.5.2
- Netmask (SSCP): 255.255.255.0, 255.255.0, 255.255.0, 255.255.0, and 255.255.255.0
- IP address of slave XSCF (bb#00-lan#0): 10.24.144.216
- Netmask of slave XSCF (bb#00-lan#0): 255.255.255.0
- Default gateway of slave XSCF (bb#00-lan#0): 10.24.144.1

EXAMPL	E3 Applyt	he following network settings after rebooting the XSCF in the SPARC	
		M12-2/M10-1/M10-4.	
Host name (bb#00): hostname-0			

DNS domain name: example.com

- Name server: 10.23.4.3
- Interface: Enables bb#00-lan#0 at a start.
- IP address (bb#00-lan#0): 10.24.144.214
- Netmask (bb#00-lan#0): 255.255.255.0
- Routing (default gateway): 10.24.144.1

XSCF> applynetwork

```
The following network settings will be applied:

bb#00 hostname :hostname-0

DNS domain name :example.com

nameserver :10.23.4.3

interface :bb#00-lan#0

status :up

IP address :10.24.144.214

netmask :255.255.0

route : -n 0.0.0.0 -m 0.0.0.0 -g 10.24.144.1

interface :bb#00-lan#1

status :down

IP address :

netmask :

route :

Continue? [y|n] :y
```

EXAMPLE 4 Apply the XSCF network settings without setting the bb#00-lan#0 and bb#00-lan#1 routings.

XSCF> applynetwork

```
The following network settings will be applied:

bb#00 hostname :hostname-0

DNS domain name :example.com

nameserver :10.23.4.3

interface :bb#00-lan#0

status :up

IP address :10.24.144.214

netmask :255.255.255.0

route :

interface :bb#00-lan#1

status :up

IP address :10.24.131.215

netmask :255.255.0

route :

Continue? [y|n] :y
```

```
XSCF> applynetwork
 The following network settings will be applied:
   bb#00 hostname :hostname-0
   DNS domain name :example.com
   nameserver :10.23.4.3
   interface :bb#00-lan#0

    status
    :down

    IP address
    :10.24.144.214

    netmask
    :255.255.255.0

    route
    :

   route
                       :
   interface :bb#00-lan#1
    status
                     :down
   IP address :10.24.131.215
netmask :255.255.255.0
                 :
   route
 Continue? [y|n] :y
EXAMPLE 6 Apply the XSCF network settings in the SPARC M12-2S/M10-4S with the
            building block configuration (without crossbar box), while a master XSCF is
            normal, but a standby XSCF has a failure.
 XSCF> applynetwork
 The set state is as follows now.
   bb#00 hostname :hostname-0
   bb#01 hostname :
   DNS domain name :example.com
   nameserver :10.23.4.3
   interface :bb#00-lan#0
    status
                     :up

        IP address
        :10.24.144.214

        netmask
        :255.255.255.0

        route
        :-n 0.0.0.0 -m 0.0.0.0 -g 10.24.144.1

   interface :bb#00-lan#1
   status
                      :down
   IP address

NAME	clearremotepwrmgmt - Deletes the management information of the remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/ M10 systems.			
SYNOPSIS	clearremotepwrmgmt [-a -G groupid] [[-q] - {y n}]			
	clearremotepwrmgmt -h			
DESCRIPTION	clearremotepwrmgmt is a command to delete the management information of remote power management group on the host node that has been registered as a remote power management group.			
	Before incorporating a host node to the remote power management group or deleting it from the remote power management group, you need to execute this command on the target host node. You do not have to execute clearremotepwrmgmt on the I/O node because the management information is not stored on the I/O node.			
Privileges	To execute this command, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-a	Deletes all administrative information of remote power management groups which is configured. When the -a and -G options are omitted, it is regarded as the -a option is specified.		
	-G groupid Specifies the remote power management group to delete the information. In groupid, specify only a single group ID using integer from 1 to 32. When the -a and -G options are omitted, is regarded as the -a option is specified.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-n	Automatically responds to prompt with "n" (no).		
	-đ	Prevents display of messages, including prompt, for standard output.		
	-У	Automatically responds to prompt with "y" (yes).		
EXTENDED DESCRIPTION	 When you execute clearremotepwrmgmt, if the remote power management function is enabled, it causes an error. It is necessary to set it disabled by using setremotepwrmgmt -c disable. When no remote power management group exists, it ends normally. 			

	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 			
EXAMPLES	EXAMPLE 1 Delete the management information of the remote power management group on the host node.			
	<pre>XSCF> clearremotepwrmgmt All remote power management group informations are cleared. Continue? [y n]: y The command completed successfully. XSCF></pre>			
	EXAMPLE 2 Delete all administrative information of remote power management groups in the host node.			
	<pre>XSCF> clearremotepwrmgmt -a All remote power management group informations are cleared.Continue? [y n]: y The command completed successfully. XSCF></pre>			
	EXAMPLE 3 Delete the administrative information of remote power management group #1 in the host node.			
	<pre>XSCF> clearremotepwrmgmt -G 1 Group#01 remote power management group informations are cleared.Continue? [y n]: y The command completed successfully. XSCF></pre>			
EXIT STATUS	The following exit values are returned.			
	0 Indicates normal end.			
	>0 Indicates error occurrence.			
SEE ALSO	ALSO getremotepwrmgmt(8), setpacketfilters(8), setremotepwrmgmt(8), showremotepwrmgmt(8)			

NAME	clearstatus - Clear the fault information of field replaceable units (FRUs) that have been detected as faulty units.		
SYNOPSIS	clearstatus devicepath		
	clearstatus -h		
DESCRIPTION	clearstatus is a command to clear the fault information of specified FRUs that have been detected as faulty units.		
	The following fa	ult information is cleared:	
	 Fault informa 	tion which is stored in XSCF	
	 The fault flag 	stored in the FRUID-ROM of FRU	
Privileges	To execute this c	command, platadm privilege is required.	
	For details on us	ser privileges, see setprivileges(8).	
OPTIONS	The following o	ption is supported:	
	-h	Displays usage statement. When used with other options or operands, an error occurs.	
OPERANDS	The following operand is supported:		
	devicepath	Specifies a FRU of which the faulty flag is cleared. FRUs shown below can be specified according to the system configuration.	
		• For SPARC M12-1/M10-1:	
		/MBU	
		/MBU/MEM#x x: an integer between 00A and 03A, between 10A and 13A, between 00B and 03B, between 10B and 13B	
		/MBU/PCI#x/LINK	
		x: an integer between 0 and 2	
		/FAN#x x: an integer between 0 and 6	
		/OPNL	
		/PSU#x x: 0 or 1	
		/PSUBP	

Ϊ	BB#x/CMUL
	<i>x</i> : an integer between 0 and 15
Γ	BB#x/CMUL/MEM#y
	<i>x</i> : an integer between 0 and 15, <i>y</i> : an integer between 00A and 07A, between 10A and 17A, between 00B and 07B, between 10B and 17B
1	BB#x/CMUU
<i>'</i>	<i>x</i> : an integer between 0 and 15
/	BB#x/CMUU/MEM#y
	<i>x</i> : an integer between 0 and 15, <i>y</i> : an integer between 00A and 07A, between 10A and 17A, between 00B and 07B, between 10B and 17B
/	BB#x/XBU#y
	<i>x</i> : an integer between 0 and 15, <i>y</i> : 0 or 1
/	BB#x/PSUBP
	x: an integer between 0 and 15
/	BB#x/OPNL
	<i>x</i> : an integer between 0 and 15
/	BB#x/FANU#y
	<i>x</i> : an integer between 0 and 15, <i>y</i> : an integer between 0 and
/	BB#x/PSU#y
	x: an integer between 0 and 15, y : 0 or 1
/	BB#x/PCI#y/LINK
	<i>x</i> : an integer between 0 and 15, <i>y</i> : an integer between 0 and
	10

■ For SPARC M12-2/M12-2S (without crossbar box): /BB#x/CMUL *x*: an integer between 0 and 15 /BB#x/CMUL/MEM#y x: an integer between 0 and 15, y: an integer between 00A and 07A, between 00B and 07B, between 00C and 07C /BB#x/CMUUx: an integer between 0 and 15 /BB#*x*/CMUU/MEM#*y x*: an integer between 0 and 15, *y*: an integer between 00A and 07A, between 00B and 07B, between 00C and 07C /BB#x/XBU#yx: an integer between 0 and 15, y: 0 or 1 /BB#x/XSCFU x: an integer between 0 and 15 /BB#x/PSUBP*x*: an integer between 0 and 15 /BB#x/OPNL*x*: an integer between 0 and 15 /BB#x/FANU#y*x*: an integer between 0 and 15, *y*: an integer between 0 and 7 /BB#x/PSU#y*x*: an integer between 0 and 15, *y*: an integer between 0 and 3 /BB#x/PCI#y/LINK*x*: an integer between 0 and 15, *y*: an integer between 0 and 10 ■ For SPARC M12-2S (with crossbar box)/M10-4S (with crossbar box): /XBBOX#x/XBU#yx: an integer between 80 and 83, y: an integer between 0 and 2 /XBBOX#x/XSCFU x: an integer between 80 and 83 /XBBOX#x/XBBPU x: an integer between 80 and 83 /XBBOX#x/XSCFIFU x: an integer between 80 and 83 XBBOX#x/OPNLx: an integer between 80 and 83 /XBBOX#x/FANU#yx: an integer between 80 and 83, y: an integer between 0 and 3 /XBBOX#x/PSU#yx: an integer between 80 and 83, y: 0 or 1

	■ For PCI Expansion unit:
	 For PCI Expansion unit: /MBU/PCI#x/PCIBOX#y/IOB x: an integer between 0 and 2, y: last 4 digits of the serial number of the PCI Expansion unit /MBU/PCI#x/PCIBOX#y/FANBP x: an integer between 0 and 2, y: last 4 digits of the serial number of the PCI Expansion unit /MBU/PCI#x/PCIBOX#y/FAN#z x: an integer between 0 and 2, y: last 4 digits of the serial number of the PCI Expansion unit /MBU/PCI#x/PCIBOX#y/FAN#z x: an integer between 0 and 2, y: last 4 digits of the serial number of the PCI Expansion unit, z: an integer between 0 and 2 /MBU/PCI#x/PCIBOX#y/PSU#z
	 x: an integer between 0 and 2, y: last 4 digits of the serial number of the PCI Expansion unit, z: 0 or 1 /MBU/PCI#x/PCIBOX#y/LINKBD x: an integer between 0 and 2, y: last 4 digits of the serial
	number of the PCI Expansion unit /BB#x/PCI#y/PCIBOX#z/IOB x: an integer between 0 and 15, y: an integer between 0 and 10, z: last 4 digits of the serial number of the PCI Expansion
	unit /BB#x/PCI#y/PCIBOX#z/FANBP x: an integer between 0 and 15, y: an integer between 0 and 10, z: last 4 digits of the serial number of the PCI Expansion unit
	/BB#x/PCI#y/PCIBOX#z/FAN#w x: an integer between 0 and 15, y: an integer between 0 and 10, z: last 4 digits of the serial number of the PCI Expansion unit, w: an integer between 0 and 2 (PB#w(PCI#w(PCIPer)/PCIPer)/PCI
	<pre>/BB#x/PCI#y/PCIBOX#z/PSU#w x: an integer between 0 and 15, y: an integer between 0 and 10, z: last 4 digits of the serial number of the PCI Expansion unit, w: 0 or 1 /BB#x/PCI#y/PCIBOX#z/LINKBD x: on integer between 0 and 15, w: an integer between 0 and</pre>
	<i>x</i> : an integer between 0 and 15, <i>y</i> : an integer between 0 and 10, <i>z</i> : last 4 digits of the serial number of the PCI Expansion unit
EXTENDED DESCRIPTION	 If you are to clear the link card of the PCI Expansion unit, confirm that the following conditions are both satisfied before executing the clearstatus.
	 The building block to which the target PCI Expansion unit is connected has been built into the physical partition (PPAR)
	 Power of that physical partition is on

I

	The clearstatus only makes the reservation to clear, and the fault flag is not cleared. To clear the fault flag and build the FRU into system, it is necessary to power off the PPAR and then power on again.		
	 If you are to clear a target other than the link card of the PCI Expansion unit, confirm that the following conditions are both satisfied before executing the clearstatus. 		
	 The building block on which the target FRU is mounted has not been built into the physical partition (PPAR) 		
	 Power of that physical partition is off 		
	The clearstatus only clears the fault flag and it is not to say that after the clearance, the FRU is built into the system. To build the FRU into the system, it is necessary to use the replacefru(8), turn off the system input power and then turned on again, or start up PPAR.		
	 If you are to clear the CPU memory unit (CMUU or CMUL), the flag of the subordinate memory (DIMM) is also cleared. 		
	• Execute the clearstatus after disabled the write inhibit to FRUID-ROM. If the write inhibit to FRUID-ROM is enabled, clear of the fault information of the FRU is not performed.		
	 The Deconfigured status cannot be cleared by this command. The Deconfigured status will be cleared automatically after the abnormality, the root cause of the Deconfigured status, is resolved. 		
EXAMPLES	EXAMPLE 1 Clears the fault flag of /BB#00/CMUL.		
	XSCF> clearstatus /BB#00/CMUL		
	EXAMPLE 2 Clears the fault flag of /MBU/PCI#0/PCIBOX#A3B5/IOB.		
	XSCF> clearstatus /MBU/PCI#0/PCIBOX#A3B5/IOB		
EXIT STATUS	The following exit values are returned:		
	0 Successful completion.		
	>0 An error occurred.		

clearstatus(8)

NAME	console - Connects to the control domain console.			
SYNOPSIS	console [[-q] -{y n}] -p ppar_id [-f -r] [-s escapeChar]			
	console -h			
DESCRIPTION	console is a command to connect from the XSCF shell to the control domain console on the specified physical partition (PPAR).			
	There are two types of control domain consoles, RW console that is available for inputs and outputs and RO console that is available only for reference. To one PPAR, only one RW console can be connected, but more than one RO console can be connected. If one RW console has been already connected, attempting to connect to another RW console causes an error. Even in this case, if the user has platadm privilege or pparadm privilege for the target PPAR, it can be connected will be disconnected.			
	To end the control domain console and return to the XSCF shell, press the [Enter] key, and then enter "#" and "." (period).			
	Note – If you return to the XSCF shell from the domain console, or if you terminate the XSCF shell, both without logging out of the domain, you will be automatically logged out from the domain. At the same time, a termination signal might be sent to any program that is running in the background on the domain console.			
	Note – Suppose the OpenBoot PROM environmental variables input-device and output-device are set to " <i>keyboard</i> " and " <i>screen</i> ," respectively, and you are using a control domain console through a USB keyboard and a graphics card. In this situation, do not use this command to connect the control domain console to an RW console. Specify –r to connect with an RO console. If this control domain console is inadvertently connected as an RW console, the console will no longer appear. To make the console appear again, terminate this command and restart the OS.			
Privileges	To execute this command, any of the following privileges is required.			
	platadm, platop, fieldeng Enables execution for all PPARs.			
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.			
	For details on user privileges, see setprivileges(8).			

console(8)

OPTIONS	The following options are supported.		
	-f	Forcibly connects to an RW console. The RW console that is currently connected will be disconnected. This can be specified only by a user who has platadm privilege or pparadm privilege for the target PPAR.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID of the PPAR to be connected. For <i>ppar_id</i> , only one integer from 0 to 15 can be specified depending on the system configuration.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-r	Connects to an RO console.	
	−s escapeChar	Specifies an escape symbol. The default is "#." As <i>escapeChar</i> , any of the following characters can be specified. Use the double quotation marks (") to enclose the character.	
		"#", "@", "^", "&", "?", "*", "=", ".", " "	
		The specified escape symbol is enabled only in the session in which console is executed.	
	-у	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION • When you execute the command, a prompt to confirm whether to the specified contents is displayed. To execute, press the [y] key. The [n] key.		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press	
	In the domain console, "#" used for the first letter in the line is recognized escape symbol. The escape symbol is specified for having the console per special processing. The examples of combination available for specifying w are as shown below.		
	"#" + "?"	Outputs the status message.	
	"#" + "."(period)	Disconnects the control domain console.	
	 To input "#" for the console at the beginning of the line, press the [#] key twi 		
	 To display the information about the control domain console that is currently connected to the PPAR, use showconsolepath(8). 		

I

console(8)

EXAMPLES | **Example 1** Connect to the RW console of PPAR-ID 0.

```
XSCF> console -p 0
 Console contents may be logged.
 Connect to PPAR-ID 0?[y|n] :y
 :
 <<Contents of domain console input/output are displayed.>>
 << Pressing the [#] + [?] key combination outputs a status message.>>
 console: read write mode.
 << Pressing the [#] + [.] key combination exits from the control domain console.>>
 exit from console.
 XSCF>
           Connect to the RW console of PPAR-ID 1 forcibly. At this time, specify "#" for
Example 2
            escape symbol.
 XSCF> console -p 1 -f -s "#"
 Console contents may be logged.
 Connect to PPAR-ID 1?[y|n] :y
 <<Contents of domain console input/output are displayed.>>
 << Pressing the [#] + [?] key combination outputs a status message.>>
 console: read write mode.
 << Pressing the [#] + [.] key combination exits from the control domain console.>>
 exit from console.
 XSCF>
           Connect to the RO console of PPAR-ID 2.
Example 3
 XSCF> console -p 2 -r
 Console contents may be logged.
 Connect to PPAR-ID 2? [y | n]: y
 <<Contents of domain console input/output are displayed.>>
 << Pressing the [#] + [?] key combination outputs a status message.>>
 console: read only mode.
 << Pressing the [#] + [.] key combination exits from the control domain console.>>
 exit from console.
 XSCF>
```

console(8)

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.

NAME	deleteboard - Releases the physical system board (PSB) from the physical partition (PPAR) configuration.		
SYNOPSIS	<pre>deleteboard [[-q] - {y n}] [-f] [-v] [-c disconnect] [[-m function=mode]] psb [psb]</pre>		
	deleteboard $[-q] - \{y n\} [-f] [-v] - c unassign [[-m function=mode]] psb [psb]$		
	deleteboard [[-	q] -{y n}] [-f] -c reserve psb [psb]	
	deleteboard -h		
DESCRIPTION	deleteboard is a command to release a PSB from the PPAR configuration, in which the PSB is currently incorporated.		
	A physical system	m board (PSB) means one building block (BB).	
	deleteboard ca	annot be used on a SPARC M12-1/M12-2/M10-1/M10-4.	
	You can specify any of the following releasing methods depending on the conditions after releasing the PSB.		
	disconnect	Releases the PSB from the PPAR configuration and sets it to assigned state. Because the PSB remains being assigned to the PPAR configuration, you can incorporate it into the PPAR again by restarting the PPAR or executing addboard(8).	
	unassign Releases the PSB completely from the PPAR configuration and sets it to system board pool state. The PSB in system board pool state can be incorporated or assigned to other PPAR configuration.		
	reserve Does not release the PSB immediately from the PPAR configuration but just reserves it for releasing. After it is reserved, when the specified PPAR is stopped, the PSB is released from the PPAR configuration and set in system box pool state.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).		

deleteboard(8)

OPTIONS	The following options are supported.	
	-c disconnect	Releases the PSB from the PPAR configuration and sets it to assigned state. If you omit the -c option, -c disconnect is assumed specified.
	-c reserve	Reserves the releasing of PSB. If you omit the -c option, -c disconnect is assumed specified.
	-c unassign	Releases the PSB completely from the PPAR configuration and sets it to system board pool state. If you omit the -c option, -c disconnect is assumed specified.
	-f	Releases the specified PSB forcibly.
		Caution – Releasing a PSB from PPAR forcibly by using the -f option may lead to serious problems on a process to which the CPU bound or on a process that is accessing to the device. For this reason, we recommend that users do not use the -f option during normal operation. If you specify the -f option, be sure to check the conditions of PPAR and business processes.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.

-m function=mode	Set up the operation mode and its value. Specify the operation mode to <i>function</i> . Any of the following can be specified.		
	insufficient at t uses the resour moved.	ration mode when the resources are he destination to which a logical domain that ces of the PSB that is to be detached, is insufficient at the destination, execute any of	
	 Sufficient resources must be secured at the destination by deleting the resources from the logical domain whose resources are to be moved, or from any other logical domains inside the PPAR. 		
	 Sufficient resources must be secured at the destination by shutting down any logical domain inside the PPAR. 		
	When unbind is specified to <i>function</i> , any of the following can be specified to <i>mode</i> . The default is none.		
	none	Do not secure resources at the destination. The deleteboard will produce an error if resources are insufficient. This option cannot be specified while the PPAR is running in factory-default state. If an error is produced, it is necessary to use the virtual DR feature of Oracle VM Server for SPARC to remove CPU cores or memory from logical domains.	
	resource	Secure resources at the destination by deleting resources from the logical domain whose resources are to be moved, or any other logical domains inside the PPAR. None of the logical domains is shut down to secure resources at the destination.	
	shutdown	Secure resources at the destination by deleting resources from the logical domain whose resources are to be moved, or from any other logical domains inside the PPAR. If resources were not secured, any of the logical domains inside the PPAR will shut down to secure resources at the destination.	
-n	Automatically resp	onds to prompt with "n" (no).	

	-đ	Prevents display of messages, including prompt, for standard output.
	-V	Show the detailed progress report of the processing of PSB detachment. Ignored when executed along with the $-q$.
		On the SPARC M12-2S, the command outputs a detailed progress report even if this option is omitted.
	-У	Automatically responds to prompt with "y" (yes).
OPERANDS	The following op	perands are supported.
	psb	Specifies the PSB number of the PSB to be released. You can make multiple specifications by separating them with spaces. The specification format is below.
		xx-y xx Specifies the BB-ID which is an integer from 00 to 15. y It is fixed to 0.
EXTENDED DESCRIPTION		ecute the command, a prompt to confirm whether to execute it with contents is displayed. To execute, press the [y] key. To cancel, press
	already been r	-c disconnect while the PPAR is stopped or if the PSB has released from the PPAR configuration, no processing is performed. e PPAR is in starting process or in stopping process, it causes an
	already been r assigned state system board	-c unassign even while the PPAR is stopped or the PSB has released from the PPAR configuration, the PSB is switched from the to the system board pool state. If the PSB has already been in the pool state, no processing is performed. While the PPAR is in ss or in stopping process, it causes an error.
	been released from the assig	-c reserve while the PPAR is stopped or the PSB has already from the PPAR configuration, the PSB is switched immediately ned state to the system board pool state. If the PSB has already stem board pool state, no processing is performed.
		s released, the hardware resources on the PSB are released from the . Therefore, it may take time to execute the command.
	the specified P incorporated.	ned state is the state that the PSB is reserved for incorporating to PPAR. By restarting the PPAR or executing addboard(8), the PSB is You cannot incorporate or assign the PSB that has already been by other PPAR.

	 The system board pool is the state that the PSB does not belong to any PPAR. Because the PSB in system board pool state does not belong to any PPAR, you can assign or incorporate it freely as long as it is defined in PCL. Even if the PPAR is not running, you can execute this command. However, to execute this command with specifying -c unassign or -c disconnect while the PPAR is running, the Logical Domains (LDoms) Manager needs to be running. When the PPAR is running in the factory-default state, an error is produced if -m unbind=none is specified. When the PPAR is running in the factory-default state, specify either -m unbind=resource or -m unbind=shutdown. If the PPAR DR feature is disabled, deleteboard -c unassign or deleteboard -c disconnect cannot be executed when the PPAR is running. Please refer to setpparmode(8) and showpparmode(8) for details on the PPAR DR feature. If CPU Activation error occurs in a PPAR, deleteboard -c unassign or deleteboard -c disconnect cannot be executed when the PPAR is running.
EXAMPLES	<pre>EXAMPLE 1 Put PSB00-0, 01-0, 02-0, 03-0 in the system board pool (execute the following</pre>
	PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] : \mathbf{Y} PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] : \mathbf{Y} PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] : \mathbf{Y} PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] : \mathbf{Y}
	<pre>EXAMPLE 3 Put PSB01-0 in the system board pool on SPARC M10-4S (execute the follow- ing command when the PPAR is powered on). XSCF> deleteboard -c unassign 01-0 PSB#01-0 will be unassigned from PPAR immediately. Continue?[y n] :y Start unconfigure preparation of PSB. [1200sec] 0 30 60 90120end Unconfigure preparation of PSB has completed. Start unconfiguring PSB from PPAR. [7200sec]</pre>
	<pre>PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] :y PSB#00-0 will be unassigned from PPAR after the PPAR restarts. Continue?[y n] :y EXAMPLE 3 Put PSB01-0 in the system board pool on SPARC M10-4S (execute the follow- ing command when the PPAR is powered on). XSCF> deleteboard -c unassign 01-0 PSB#01-0 will be unassigned from PPAR immediately. Continue?[y n] :y Start unconfigure preparation of PSB. [1200sec] 0 30 60 90120end Unconfigure preparation of PSB has completed.</pre>

deleteboard(8)

	PSB power off sequence started. [1200sec] 0 30 60 90120end Operation has completed	
EXIT STATUS	The following exi	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	deletecodactiva	ation - Deletes the CPU Activation key from the system.	
SYNOPSIS	deletecodactivation [-f] [$[-q] - \{y n\}$] -i key-index		
	deletecodactiv	ation -h	
DESCRIPTION		tivation is a command to delete the specified CPU Activation key C $M12/M10$ systems.	
		tails on the CPU Activation key, see the <i>Fujitsu SPARC M12 and</i> ARC M10 System Operation and Administration Guide.	
	resource that is Activation key assigned numb the system. To	ecks the number of CPU Activations and the number of CPU core s allocated to a physical partition (PPAR). If deleting a CPU results in the number of CPU Activations being lower than the per of CPU core resource, the CPU Activation key is not deleted from delete the CPU Activation key in this case, you need to reduce the per of CPU core resource. Use setcod(8) to change the assigned J Activations.	
Privileges	To execute this	command, platadm privilege is required.	
	For details on	user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-f	Deletes the specified CPU Activation key forcibly from the system.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i key-index	Specifies the administration number of the CPU Activation key to be deleted from the system. Use showcodactivation(8) to check the administration number.	
	-n	Automatically responds to prompt with "n" (no).	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press the	
EXAMPLES	EXAMPLE 1 De	lete the CPU Activation key with the administration number 10.	
		ecodactivation -i 10 ll be deleted, Continue?[y n]: y	

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.

NAME	deletepowersche (PPAR).	dule - Deletes a schedule for powering on/off a physical partition	
SYNOPSIS	deletepowerschedule $[[-q] - \{y n\}] \{-r id -p ppar_id -a\}$		
	deletepowersche	edule -h	
DESCRIPTION	deletepowersc PPAR.	hedule is a command to delete a schedule for powering on/off a	
Privileges	To execute this c	ommand, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-a	Deletes all the schedule data.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID for deleting a schedule. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> . All the schedules which are set to the specified PPAR-ID are deleted.	
	-d	Prevents display of messages, including prompt, for standard output.	
	-r id	Specifies the schedule data to be deleted. You can check <i>id</i> by using showpowerschedule(8).	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	set schedule.	wpowerschedule(8), you can check the contents of the currently	
		rschedule(8) to set a schedule. n-existent <i>ppar_id</i> or <i>id</i> , or invalid option causes an error.	
	1 1 0	data which has been set by using addpowerschedule -a to cover	
		not be deleted by deletepowerschedule -p ppar_id.	

	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.
EXAMPLES	EXAMPLE 1 Delete all the schedules set to PPAR-ID 1.
	XSCF> deletepowerschedule -p 1 PPAR-ID 1 Power schedule will be deleted, Continue?[y n]: y XSCF>
	EXAMPLE 2 Delete the schedule set to the schedule ID 3.
	XSCF> deletepowerschedule -r 3 ID 3 Power schedule will be deleted, Continue?[y n]: y XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	addpowerschedule(8), setpowerschedule(8), showpowerschedule(8)

I

NAME	deleteuser - Deletes an XSCF user account.
SYNOPSIS	deleteuser user
	deleteuser –h
DESCRIPTION	deleteuser is a command to delete an XSCF user account.
	Executing deleteuser deletes the user account and all the data associated with the user account, such as a password and a public key for Secure Shell (SSH).
	When you delete a user account, the XSCF shell and the XSCF Web session which are being executed on the deleted user account end at the same time. Because the user account is deleted from the system, you cannot use the user account for login. You cannot delete any <i>user</i> accounts, including your own, that are currently logged in.
Privileges	To execute this command, useradm privilege is required.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
OPERANDS	The following operands are supported.
	<i>user</i> Specifies the XSCF user account to be deleted.
EXAMPLES	EXAMPLE 1 Delete an XSCF user account.
	XSCF> deleteuser jsmith
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

deleteuser(8)

NAME	deletevbootcerts Boot of Oracle S	- Deletes X.509 public key certificates used for performing Verified olaris.	
SYNOPSIS	deletevbootcerts -p <i>ppar_id</i> [-f] [[-q] - {y n}] -i <i>index</i>		
	deletevbootcert	s -h	
DESCRIPTION		otcerts command deletes X.509 public key certificates registered tions (PPAR) that are used for performing Verified Boot of Oracle	
	by users using t system. Moreove beforehand so th	otcerts command can only delete the certificates that are added he addvbootcerts(8), but not the certificates pre-installed in the er, the certificates that are to be deleted, must be configured hat they are not used by Verified Boot. Configuration information d by the showvbootconfig(8).	
Privileges	To execute this o	command, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	ser privileges, see setprivileges(8).	
OPTIONS	The following o	ptions are supported.	
	-f	Forcibly deletes the specified X.509 public key certificates from a PPAR.	
	-i index	Specifies the management number of the X.509 public key certificate that is to be deleted. Management numbers from 1 through 5 can be allotted. Management numbers can be confirmed by the showvbootcerts(8).	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the PPAR whose X.509 public key certificates are to be deleted.	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXAMPLES	EXAMPLE 1 Dele	te the X.509 public key certificate that is registered with management	

	number 1 to PPAR-ID 0.
	XSCF> deletevbootcerts -p 0 -i 1 Index 1, CUSTOM_CERT_1 will be deleted from PPAR-ID 0, Continue?[y n]: y
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	addvbootcerts (8), setvbootconfig (8), showvbootcerts (8), showvbootconfig (8)

NAME	diagxbu - Diagnose crossbar cable and crossbar unit (XBU).		
SYNOPSIS	diagxbu [[-q] - {y n}] -b bb_id -t target_bb [-t target_bb]		
	diagxbu [[-q] - {y n}] -ь bb_id -р ppar_id		
	diagxbu -h		
DESCRIPTION	diagxbu is a command to to diagnose a crossbar unit or cables which are connected to a crossbar unit, that is mounted on a SPARC M12-2S/M10-4S chassis or crossbar box.		
	The crossbar unit is mounted on SPARC M12-2S/M10-4S or a crossbar box, connected with a crossbar cable. The diagxbu conducts diagnosis by checking whether the connections between SPARC M12-2S/M10-4S chassis, connected by crossbar cables, are being properly established. To execute diagxbu, specifying SPARC M12-2S/M10-4S to be diagnosed, and SPARC M12-2S/M10-4S to be communicated are required.		
	SPARC M12-2S/M10-4S to be diagnosed can be specified with -b <i>bb_id</i> . To start the diagnosis, the physical system board (PSB) on SPARC M12-2S/M10-4S must be in system board pool, or powered off.		
	Any of the following SPARC M12-2S/M10-4S should be specified, according to the status of PSB on SPARC M12-2S/M10-4S, as the communication target.		
	 When a PSB is in the system board pool, or its power is off, specify SPARC M12- 2S/M10-4S by -t <i>target_bb</i>. 		
	 Several SPARC M12-2S/M10-4S chassis can be specified as the target of -t target_bb. In such a case, PSBs on SPARC M12-2S/M10-4S must not be incorporated in PPARs, or such PPARs should be in a powered off state. 		
	■ When a PSB is running on a physical partition (PPAR), specify PPAR by -p <i>ppar_id</i> . Only one -p <i>ppar_id</i> can be specified. At this time, the PPAR must be in a powered on state.		
	This command is not supported on SPARC M12-1/M12-2/M10-1/M10-4.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		

diagxbu(8)

OPTIONS	The following options are supported.		
	-ь bb_id	Specifies BB-ID of a SPARC M12-2S/M10-4S to diagnose. You can specify any of the following values for <i>bb_id</i> .	
		For SPARC M12-2S/M10-4S (without crossbar box): an integer from 0 to 3	
		For SPARC M12-2S/M10-4S (with crossbar box): an integer from 0 to 15	
		It can be used along with $-t$ or $-p$.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the PPAR on which the destination SPARC M12-2S/M10-4S is running. <i>ppar_id</i> can be specified with an integer 0-15 depending on the system configuration.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-t target_bb	Specifies BB-ID of the target SPARC M12-2S/M10-4S. You can specify any of the following values for <i>bb_id</i> .	
		For SPARC M12-2S/M10-4S (without crossbar box): an integer from 0 to 3	
		For SPARC M12-2S/M10-4S (with crossbar box): an integer from 0 to 15	
	-у	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execut the specified contents is displayed. To execute, press the [y] key. To can the [n] key. 		
	■ An error occurs when a PSB on SPARC M12-2S/M10-4S specified with -b <i>bb_id</i> or -t <i>target_bb</i> is in one of the following statuses.		
	 Being included in a PPAR and this PPAR is running. 		
	 Being included in a PPAR and this PPAR is at OpenBoot PROM of the booting process. 		
	 Being included in a PPAR and this PPAR is being powered on, powered off, or in the resetting process. 		
	 addboard(8) and deleteboard(8) are in execution for PSB. 		
	 An error occurs when a PPAR specified with -p <i>ppar_id</i> is in one of the following states. 		

- No PPAR exists.
- PPAR is not running.
- An error occurs when testsb(8) or diagxbu(8) is being performed.
- Diagnosis is terminated when [Ctrl]+[C] has been entered while executing diagnosis of a crossbar cable or a crossbar unit.
- Diagnosis of the crossbar unit cannot be executed on a system which consists only one SPARC M12-2S/M10-4S chassis.
- Diagnosis target and connection target SPARC M12-2S/M10-4S chassis and PPAR is selected in the following ways:
 - Diagnosing crossbar boxes

After replacing or adding a crossbar box, use the following procedure to diagnose whether connections using crossbar boxes are properly established.

1. Execute the showboards -a command and check that power is turned off (the "Pwr" column shows "n" and the "Test" column does not show "Testing") and the "Fault" column shows "Normal" in all the PSBs.

2. Among the PSBs in 1., select the SPARC M12-2S/M10-4S chassis that is to be diagnosed and specify all the other PSBs as the target of connection to execute the diagxbu.

To conduct diagnosis with the above procedure, at least two PSBs , whose power has been turned off and the "Fault" column in the output of the showboards -a command shows "Normal", is necessary. If there are no more than one such PSBs or if there are no PPARs which should be powered off before replacing crossbar boxes, conduct diagnosis by specifying a running PPAR as follows. In such a case, the target SPARC M12-2S/M10-4S chassis and PPAR is to be selected in the following way.

[In case the diagnosis target crossbar box is XBBOX#80 or XBBOX#81]

There must be at least two BB-IDs with the range of 0 to 11 among the BB-IDs included in PPAR (specified by the -p) and the BB-IDs which are specified by the -b.

[In case the diagnosis target crossbar box is XBBOX#82 or XBBOX#83]

There must be at least one BB-ID within the range of 0 to 11 among the BB-IDs included in PPAR (specified by the -p) and at least one BB-ID within the range of 12 to 15 among the BB-IDs which are specified by the -b.

However, it is not possible to conduct diagnosis on crossbar boxes if there is no powered off PSBs or if the system is comprised with only one SPARC M12-2S/M10-4S chassis.

Diagnosing SPARC M12-2S/M10-4S chassis

After replacing or adding a SPARC M12-2S/M10-4S chassis, execute any of the following procedures to diagnose whether connections using SPARC M12-2S/M10-4S chassis is properly established.

	- If there is a plan to add in a configured PPAR, execute diagxbu by specifying that PPAR-ID with the $-p$ and the target BB-ID with the $-b$.		
	- In case of a PPAR, which has been planned to be added and the configuration has been determined but the PPAR has not yet constructed, execute the diagxbu with the -b, whose parameter is the BB-ID of the constituent SPARC M12-2S/M10-4S chassis that is to be diagnosed; all the other SPARC M12-2S/M10-4S chassis is to be specified with the -t.		
	- In case of a PPAR, which has been planned to be added, check the status of all the PSBs with the showboards -a and if any PSB is in a powered off state (the "Pwr" column shows "n" and the "Test" column does not show "Testing") and the "Fault" column shows "Normal", use any of their BB-ID with the -t, but if there are no such PSBs, use any of the PPAR-IDs with the -p when executing the diagxbu.		
EXAMPLES	EXAMPLE 1 Diagnosing the crossbar cable that connects BB-ID 0 and BB-ID 1, and the crossbar unit. (In this case diagnosis completed successfully.)		
	<pre>XSCF> diagxbu -b 0 -t 1 XBU diagnosis is about to start, Continue?[y n] :Y Power on sequence started. [7200sec] 0 30 60 90120end XBU diagnosis started. [7200sec] 0 30 60 90120end Power off sequence started. [1200sec] 0 30 60 90120end completed.</pre>		
	Note Please confirm the error of XBU by "showlogs error". In addition, please confirm the degraded of XBU by "showstatus".		
	EXAMPLE 2 Diagnosing the crossbar cable and the crossbar unit that connects PPAR-ID 0 and BB-ID 1. (In this case diagnosis completed successfully.)		
	<pre>XSCF> diagxbu -b 1 -p 0 XBU diagnosis is about to start, Continue?[y n] :y Power on sequence started. [7200sec] 0 30 60 90120end XBU diagnosis started. [7200sec] 0 30 60 90120end completed. Power off sequence started. [1200sec] 0 30 60 90120end completed.</pre>		
	Note Please confirm the error of XBU by "showlogs error". In addition, please confirm the degraded of XBU by "showstatus".		

l

EXAMPLE 3 Diagnosing the crossbar cable that connects PPAR-ID 0 and BB-ID 1, or crossbar unit. (The case where an error has been detected in the diagnosis.) XSCF> diagxbu -b 1 -p 0 XBU diagnosis is about to start, Continue?[y|n] :Y Power on sequence started. [7200sec] 0..... 30..... 60..... 90.....120end completed. Power off sequence started. [1200sec] 0..... 30..... 60..... 90.....120end completed. A Hardware error occurred by XBU diagnosis. *Note* Please confirm the error of XBU by "showlogs error". In addition, please confirm the degraded of XBU by "showstatus". EXIT STATUS The following exit values are returned. 0 Indicates normal end. Indicates error occurrence. >0 SEE ALSO showlogs(8), showstatus(8), testsb(8)

diagxbu(8)

NAME	disableuser - Disables an XSCF user account.		
SYNOPSIS	disableuser user		
	disableuser –h		
DESCRIPTION	disableuser is a command to disable an XSCF user account.		
	This does not affect the session that you currently log in. The disabled user account cannot be used for the next and later login. This setting is applied not only to the Secure Shell (SSH) but also to the console connected in serial or in Telnet connection. A login to XSCF Web is also disabled.		
	All the data associated to the disabled user account such as a password or SSH key are stored in XSCF. Using enableuser(8) enables the disabled user again.		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
OPERANDS	The following operands are supported.		
	<i>user</i> Specifies the XSCF user account to be disabled.		
EXAMPLES	EXAMPLE 1 Disable an XSCF user account.		
	XSCF> disableuser jsmith		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

disableuser(8)

NAME	dumpcodactivation - Saves the CPU Activation key in a file.		
SYNOPSIS	dumpcodactivation [-v] [-V] [[-q] - {y n}] [-e [-P password]] [-u user] [-p proxy [-t proxy_type]] url		
	dumpcodactivation -h		
DESCRIPTION	dumpcodactivation is a command to save the CPU Activation key, which is set for XSCF, to the specified file.		
	The CPU Activation key which is saved to the file can be restored to XSCF, by usi the restorecodactivation(8).		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following op	otions are supported.	
	-e	Encrypts a file. You can specify a password using -P <i>password</i> . If you omit -P <i>password</i> , it displays a prompt for password entry. When you encrypt and save the CPU Activation key, you need a password for restoring it. If you lose the password, the CPU Activation key cannot be restored.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-₽ password	Sets a password for encryption. Specify it with the $-e$ option. If you omit the $-P$ option, a prompt for setting a password appears. You can specify this using up to 128 characters.	
	-p proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type,</i> the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-t proxy_type	Specifies the proxy type. Specify it with the $-p$ option. You can specify any of http, socks4, and socks5. The default is http.	
	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.	

dumpcodactivation(8)

-			
	-V	Displays detailed information. This option is used to diagnose server problems.	
	-V	Displays detailed network activities. This option is used to diagnose network and server problems.	
	-У	Automatically responds to prompt with "y" (yes).	
OPERANDS	The following operands are supported		
	url	Specifies URL to be the destination of saving the CPU Activation key. The following types of format are supported.	
		Specify an absolute path for a file.	
		<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>	
EXTENDED DESCRIPTION	When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		
	CPU Activation k the same system s	ey can only restore the data that was saved from a system with serial number.	
EXAMPLES	EXAMPLE 1 Save t	he CPU Activation key on the USB device.	
	<pre>XSCF> dumpcodactivation -v -V file:///media/usb_msd/cpukey.cfg reading database</pre>		
	removing tempo: operation comp XSCF>	rary file done leted	
EXIT STATUS	The following exi	t values are returned.	
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	dumpconfig(8),	restorecodactivation (8)	

NAME	dumpconfig - Saves the XSCF configuration information in a file.		
SYNOPSIS	dumpconfig [-v] [-V] [[-q] -{y n}] [-e [-P password]] [-c comment] [-u user] [-p proxy [-t proxy_type]] url		
	dumpconfig -h		
DESCRIPTION	dumpconfig is a command to save the XSCF configuration information in the specified file.		
	The following are regarded as the XSCF configuration information.		
	 System specific information 		
	System specific information of each system includes the following information on the place of installation or network information etc.		
	 NTP: NTP configuration 		
	 Altitude configuration 		
	 Power capping: power capping configuration 		
	 Power supply scheduling: power supply scheduling configuration, enable/ disable scheduling, power recovery mode 		
	 Remote Power Management (RCIL): Remote Power Management configuration, Remote Power Management group configuration 		
	 XSCF network: take-over IP address, SSCP, host name, domain name, routing, DNS configuration, IP packet filtering rules 		
	 SSH/Telnet service: SSH service configuration, Telnet service configuration, hot public key, user public key, timeout value 		
	 HTTPS service: HTTPS service configuration, certification authority, web server private key, web server certificate 		
	 Remote maintenance service configuration information: REMCS configuration 		
	 CPU activation information: CPU activation key, CPU core resource information 		
	 Logical domain configuration information: logical domain configuration, startup reservation information 		
	 OpenBoot PROM environment variable configuration information: Oracle Solaris/OpenBoot PROM configuration 		
	 Verified Boot: Information of X.509 public key certificates used for performing Verified Boot of Oracle Solaris 		
	 Remote storage: Connection settings to remote storage 		
	 System common information 		
	System common information includes the following information that are used among systems.		

dumpconfig(8)

I

	 User administration: user account, password policy, password, user privilege, lockout feature 		
	 Audit: audit configuration 		
	 Time: time zone, daylight saving time 		
	 Warm-up operation time: warm-up operation time configuration 		
	 Dual power feed: dual power feed configuration 		
	• Air conditioning wait time: wait time before the system startup configuration		
	 Direct I/O function: enable/disable direct I/O function to PCI card mounted on a PCI expansion unit 		
	 SSH/Telnet service: timeout value 		
	 LDAP service: LDAP client, enable/disable LDAP 		
	 Active Directory service: Active Directory client 		
	 LDAP over SSL service: LDAP over SSL client 		
	 Mail notification: SMTP configuration, mail notification function 		
	 SNMP: SNMP agent, trap host, v3 trap host, User-based Security Model (USM) management information, View-based Access Control Model (VACM) management information 		
	 System Board configuration: memory mirroring 		
	 Remote maintenance service configuration information: ASR feature (enable/ disable service tag) 		
	 Physical partition configuration information: allocation status of physical partitions in PSB, configuration policy, I/O nullification option 		
	 Physical partition mode configuration 		
	 OpenBoot PROM environment variable configuration information: XSCF configuration 		
	 High speed mode of the CPU of SPARC M12-2S 		
	Using restoreconfig(8) enables restoration of the saved configuration information to XSCF. Please refer to restoreconfig(8) for details on the XSCF configuration information that will be restored.		
	The XSCF configuration information file is a file in which the XSCF configuration information is saved in the base64 encoded text format. Users can specify any name for this file. This file is encrypted by specifying the -e option.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng		
	For details on user privileges, see setprivileges(8).		
	tor details on user privileges, see seepi iviteges(0).		

OPTIONS | The following options are supported.

Sets a comment in the file. If there are several piece of the saved XSCF configuration information, this can be used for categorizing the files. The comment will not be loaded into the XSCF at restoration. Specify <i>comment</i> using up to 132 characters. You can use
Specify <i>comment</i> using up to 132 characters. You can use
alphanumeric characters, double quotation marks ("), and spaces. Alphabets are case-sensitive. To use spaces, enclose the entire comment in double quotation marks. No special characters are available.
An example of a comment is shown below. -c "This is a valid comment"
Because spaces are used in the comment without enclosed in double quotation marks, the following example is incorrect. -c This is an invalid comment
Because it includes unavailable special characters, the following example is incorrect. -c "This! is @invalid"
Encrypts a file. You can specify a password using –P <i>password</i> . If you omit - P <i>password</i> , it displays a prompt for password entry. When you encrypt and save the XSCF configuration information, you need a password for restoring it. If you lose the password, the XSCF configuration information cannot be restored.
Displays the usage. Specifying this option with another option or operand causes an error.
Automatically responds to prompt with "n" (no).
Sets a password for encryption. Specify it with the -e option. If you omit the -P option, a prompt for setting a password appears. You can specify this using up to 128 characters.
Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http. Specify <i>proxy</i> in <i>servername:port</i> format.
Prevents display of messages, including prompt, for standard output.
Specifies the proxy type. Specify it with the $-p$ option. You can specify any of http, socks4, and socks5. The default is http.

dumpconfig(8)

-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.	
-V	Displays detailed information. This option is used to diagnose server problems.	
-V	Displays detailed network activities. This option is used to diagnose network and server problems.	
-У	Automatically responds to prompt with "y" (yes).	
The following operands are supported		
url	Specifies URL to be the destination of saving the XSCF configuration information. The following types of format are supported.	
	Specify an absolute path for a file.	
	<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>	
 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. Note – If XSCF configuration information which was saved by dumpconfig, is restored by restoreconfig(8) on the same chassis or on a different chassis, confirm that the XSCF configuration information has been properly restored. 		
<pre>XSCF> dumpconfig -v -V file:///media/usb_msd/system.cfg file '/media/usb_msd/system.cfg ' already exists Do you want to overwrite this file? NAME	enableuser - Enables an XSCF user account.		
SYNOPSIS	enableuser user		
	enableuser -h		
DESCRIPTION	enableuser is a command to enable the disabled XSCF user account.		
	The enabled user account becomes available for login to the console by using Secure Shell (SSH). Using enableuser enables the account that is disabled by using disableuser(8).		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
OPERANDS	The following operands are supported.		
	<i>user</i> Specifies the XSCF user account to be enabled.		
EXAMPLES	EXAMPLE 1 Enable a user account.		
	XSCF> enableuser jsmith		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.

enableuser(8)

NAME	flashupdate - Updates the firmware.			
SYNOPSIS	flashupdate -c check -m {xcp xscf} -s version			
	flashupdate [[-q] -{y n}] -c update -m {xcp xscf} [-f] -s version			
	flashupdate -c sync			
	flashupdate -h			
DESCRIPTION	flashupdate is	a command to update the firmware.		
	This command updates the following firmware. By specifying -c check, you can check the availability of update in advance.			
	 Updating the entire XSCF Control Package (XCP) (XSCF firmware, Hypervisor firmware, OpenBoot PROM firmware, and Power-On Self-Test (POST) firmware) 			
	 Updating XSCF firmware only 			
Privileges	To execute this c	ommand, platadm or fieldeng privilege is required.		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following op	ptions are supported.		
	-c check Checks whether or not the specified firmware can be update			
	-c update	Updates the specified firmware. When the system is in the multi-XSCF configuration, all XSCFs are updated at the same time.		
	-c sync	When the system is in multi-XSCF configuration, this option matches the version of each XSCF firmware. It is used when the FRU including XSCF is replaced.		
	-f	To update the firmware to the specified version, it is overwritten even if the same version has already been written.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.			
	-m xcp Targets the entire XCP. Specify this option to check, register, and update the firmware.			
	-m xscf Targets the XSCF firmware. Specify this option to check or update the firmware.			
	-n	Automatically responds to prompt with "n" (no).		
	-q Prevents display of messages, including prompt, for standard output.			

flashupdate(8)

	-s version	Specifies the firmware version for checking, registering, or updating the firmware. <i>version</i> specifies the major version and minor version in decimal. This can be specified using the following format. <i>xxyy</i>		
		xx yy	Major version Minor version	
	-у		ponds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	2	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. When XCP or XSCF firmware is updated, the XSCF is rebooted. Therefore, while the XSCF is in LAN connection, it is once disconnected. If there is any faulty Field Replaceable Unit (FRU), the firmware cannot be updated. Correct the fault of FRU before updating it. From XCP 2050 onwards, when firmware update is completed, the master XSCF and XSCF in the standby status is automatically switched. Do not execute the switchscf(8) when running the flashupdate. 		
	 Do not execute 			
	■ The -m xscf o	option is used when	updating only the XSCF firmware.	
EXAMPLES	EXAMPLE 1 Confi	rm whether or not th	e firmware can be updated to Version 0101.	
	XSCF> flashupdate -c check -m xcp -s 0101			
	<pre>EXAMPLE 2 Update the firmware from Version 0101 to Version 0102. XSCF> flashupdate -c update -m xcp -s 0102 The XSCF will be reset. Continue? [y n] :Y XCP update is started. [2400sec] 0 30 60 90120150180210240 270300330360390420450480510 540570600</pre>			
	EXAMPLE 3 Upda	te the XSCF firmware	e from Version 0101 to Version 0102.	
	The XSCF will XCP update is 0 30		e? [y n] : y

flashupdate(8)

NAME	getflashimage - Downloads a firmware image file.		
SYNOPSIS	getflashimage [-v] [[-q] - {y n}] [-u user] [-p proxy [-t proxy_type]] url		
	getflashimage –	1	
	getflashimage $[[-q] - {y n}] [-d]$		
	getflashimage –	h	
DESCRIPTION		e is a command to download an XCP firmware image file used with) or to download a PCI expansion unit firmware image file used n(8).	
	If there are two or more older versions of the same type of firmware image files on the XSCF unit, the oldest version of the firmware image file will be removed after a new version of the firmware image file is downloaded. After the firmware image file is downloaded successfully, the correctness of the file is verified, and the MD5 checksum value is displayed.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-d	Deletes all the older versions of the XCP image file on the service processor.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-1	Displays the list of the XCP image files on the service processor.	
	-n	Automatically responds to prompt with "n" (no).	
	-р proxy	Specifies the proxy server to use for transfer. If you omit -t <i>proxy_type</i> , the default proxy type is http.Specify <i>proxy</i> in <i>servername:port</i> format.	
	-d	Prevents display of messages, including prompt, for standard output.	
	-t proxy_type	Specifies the proxy type. Specify it with the $-p$ option. You can specify any of http, socks4, and socks5. The default is http.

EXIT STATUS	The following exit values are returned.	
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	flashupdate(8),	ioxadm(8)

NAME	getremotepwrmgmt - Obtains the setup file of the remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems.		
SYNOPSIS	getremotepwrmgmt {-G groupid} [-v] [-u user] [-X proxy [-t proxy_type]] [-y -n] configuration_file		
	getremotepwrm	gmt -h	
DESCRIPTION	getremotepwrmgmt is a command to obtain the settings information of remote power management group and to save it as a management information file in CSV format.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-G groupid	Specifies one group ID of the remote power management group. You can specify a value from 1 to 32.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-t proxy_type	Specifies the proxy type.	
		Specify it with the $-x$ option. You can specify any of http, socks4, and socks5. The default is http.	
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry.	
	-v	Displays detailed information.	
		This option is used to diagnose network and server problems.	
	-X proxy	Specifies the proxy server to use for obtaining information. If you omit -t <i>proxy_type</i> , the default proxy type is http.Specify <i>proxy</i> in <i>servername:port</i> format.	
	-у	Automatically responds to prompt with "y" (yes).	

OPERANDS	The following operands are supported.		
	configuration_file	Specifies URL to be the destination of saving the management information file.	
		The following types of format are supported.	
		Specify an absolute path for a file.	
		<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>	
EXTENDED	 If non-existing 	group ID is specified for the -G option, an error occurs.	
DESCRIPTION	 You can use the management information file of the remote power management group obtained with getremotepwrmgmt as it is for when you execute setremotepwrmgmt -c config. 		
	format of the r	of the management information file to CSV. For details on the nanagement information file, see the <i>Fujitsu SPARC M12 and</i> PARC M10 System Operation and Administration Guide.	
		to create the management information file for each group. If one nformation file has multiple group IDs, it causes an error.	
	in the manage	d to access the distribution destination of the information is not set ment information file and the default user is not specified, it is ter the password when distributing the information of the remote ement group.	
	 Use the follow power manage 	ing procedure for updating the settings of the existing remote ement group.	
		emotepwrmgmt to obtain the settings information of the remote ement group to be updated as management information file.	
	2. Edit the file obt	ained in Step 1.	
		motepwrmgmt -c disable to disable the remote power unction of the remote power management group to be updated.	
		agement information file that was edited in Step 2, and execute rmgmt -c config to update the settings of the remote power group.	
		motepwrmgmt -c enable to enable the remote power unction of the updated remote power management group.	
EXAMPLES	EXAMPLE 1 On the	e FTP site, obtain the management information file of the remote power

l

NAME		ne SPARC M12-2S/M10-4S and the crossbar box from the system o the factory default
SYNOPSIS	initbb [[-q] -{y n}] [-f] -b bb_id	
	initbb -h	
DESCRIPTION	initbb detaches the SPARC M12-2S/M10-4S and the crossbar box from the system configuration and initializes it to the factory default.	
	After you execut will be halted.	ed the initbb, the SPARC M12-2S/M10-4S and the crossbar box
	initbb cannot b	be used on a SPARC M12-1/M12-2/M10-1/M10-4.
Privileges	To execute this command, platadm or fieldeng privilege is required.	
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following options are supported.	
	-ъ bb_id	Specifies the SPARC M12-2S/M10-4S or the crossbar box to initialize. In <i>bb_id</i> , you can specify an integer from 0 to 15 in case of SPARC M12-2S/M10-4S, and from 80 to 83 in case of crossbar box.
	-f	Forcibly detach the SPARC M12-2S/M10-4S or the crossbar box even though a system is abnormal condition.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-d	Prevents display of messages, including prompt, for standard output.
	-у	Automatically responds to prompt with "y" (yes).
EXTENDED DESCRIPTION	 Execute the initbb in the master XSCF. Whether it is the master XSCF or not can be confirmed by using the showbbstatus(8). 	
		annot initialize the master XSCF.
	box will be de	cuted the initbb, the SPARC M12-2S/M10-4S and the crossbar etached from the system and be halted. To build it into the system off and on the system or add on the target SPARC M12-2S/M10-4S par box.
		e serial connection to XSCF on target SPARC M12-2S/M10-4S or the the status and the completion of initialization can be confirmed.

- To initialize the crossbar box, execute the command while the system power is off.
- To initialize the crossbar box, execute the command after the system turned off. If the system is not turned off, it results in an error.

System turn-off condition means that all PPAR are turned off. If those are up and running, execution of poweroff -a will turn off all PPAR, and then system power will be disconnected. Execute the showhardconf(8) command and see the display of "System_Power:" ("On" or "Off"), to confirm the condition of system power.

- To initialize the SPARC M10-4S, execute the command while the physical system board on the SPARC M12-2S/M10-4S is in the system board pooling status, or while it is detached from the PPAR configuration. If the physical system board is not in the system board pooling status, it turns to the system board pooling status. If the physical system board is built into the PPAR configuration and the PPAR is in operation, it results in an error.
- To initialize the SPARC M12-2S/M10-4S, the PPAR which has the same ID as the target SPARC M12-2S/M10-4S needs to be powered off.
- After initialized the SPARC M12-2S/M10-4S, the PPAR which has the same ID as the target SPARC M12-2S/M10-4S becomes unable to power on. This can be resolved by either of the following methods.
 - Add on the initialized SPARC M12-2S/M10-4S and build it into the system again
 - Change the PPAR configuration to use another PPAR-ID
- In a 3BB or larger configuration with direct connections between chassis, specify and initialize the SPARC M12-2S/M10-4S except the master and standby chassis.
- When the serial number of the target SPARC M12-2S/M10-4S or the crossbar box has been used as the serial number of the system, it results in an error.
- If "n" is entered for the prompt at the command execution, it ends without initializing the SPARC M12-2S/M10-4S.
- When you specified the -f option, the SPARC M12-2S/M10-4S or the crossbar box is detached from the system configuration even though it is in the abnormal status. However, if the target SPARC M12-2S/M10-4S or the crossbar box is not normal, there is no guarantee that it will be initialized properly.
- After the command was executed, a CPU Activation key, which had been registered to the system is deleted. To retain a CPU Activation key, you must save this CPU Activation key by executing the dumpcodactivation(8) beforehand. Be sure to execute initbb before executing the restorecodactivation(8) for the restoration of the saved CPU Activation key.

In a case where initbb was executed before saving the CPU Activation key, you must register a CPU Activation key again.

	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		
EXAMPLES	EXAMPLE 1 Initializes BB#01 to the factory default. After executed the command, BB#01 stops.		
	<pre>XSCF> initbb -b 1 You are about to initialize BB/XB-Box. NOTE the following. 1. BB/XB-Box is excluded from the system and halted. 2. PPAR-ID of the same value as BB-ID becomes invalid. Continue? [y n] :y</pre>		
	EXAMPLE 2 Initialize XBBOX#81. The prompt is automatically given a "y" response. After executed the command, XBBOX#81 stops.		
	<pre>XSCF> initbb -y -b 81 You are about to initialize BB/XB-Box. NOTE the following. 1. BB/XB-Box is excluded from the system and halted. 2. PPAR-ID of the same value as BB-ID becomes invalid. Continue? [y n] :y</pre>		
	EXAMPLE 3 Initializes BB#01. The prompt is hidden and automatically given a "y" response.		
	XSCF> initbb -q -y -b 1		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	showbbstatus (8)		

initbb(8)

NAME	ioxadm - Manag server.	es the PCI Expansion unit, and the link card connected to the host	
SYNOPSIS	ioxadm [-f] [-A] [-v] [-M] env [-e] [-l] [-t] [target [sensor]]		
	ioxadm [-f] [A] [-v] [-M] list [<i>target</i>]	
	ioxadm [-f] [A] [-v] [-M] locator [on off][target]	
	ioxadm [-f] [-	A] [-v] [-M] poweroff target	
	ioxadm [-f] [-	A] [-v] [-M] poweron target	
	ioxadm [-f] [-A] [-v] [-M] reset target		
	ioxadm [-f] [-A] [-v] [-M] setled [on off blink] target led_type		
	ioxadm serial	target serial_num	
	ioxadm -c check target -s version		
	ioxadm [-f] [-A] [-V] [-M]-c update target -s version		
	ioxadm [-f] [-	A] [-M] versionlist [<i>target</i>]	
	ioxadm -h		
DESCRIPTION	ioxadm is a command to manage the PCI Expansion unit and the link card connected to the host server.		
	the operand. Wh the PCI slot built (FRU) in the PCI	t is necessary to specify the operand and the option required for at can be specified for the target device is a link card mounted in in the host server, PCI Expansion unit, or Field Replaceable Unit Expansion unit. The link cards in the host server are identified by indicating the paths from the host server to the link cards.	
	For details, see th	ne section of <i>target</i> of the option.	
Privileges	To execute this command, any of the following privileges is required.		
	Privileges	Operands or options	
	platop	env, list, versionlist operands	
	platadm	All operands except serial	
	fieldeng	All operands	
	For details on us	er privileges, see setprivileges(8).	

ioxadm(8)

OPTIONS	The following options are supported.		
	-A	Hides the headers of outputs and displays only the analyzable outputs. Each field is separated with a single tab.	
	-c check	Checks whether the firmware can be applied. Checks the firmware of the version and <i>target</i> specified by the operand. Only a PCI expansion unit can be specified in <i>target</i> .	
	-c update	Updates the firmware of the version and <i>target</i> specified by the operand. Only a PCI expansion unit can be specified in <i>target</i> .	
		Specifying a PCI expansion unit updates the firmware on the PCI expansion unit and link card.	
		Note – During the update specified in this option, after "Firmware update is started." appears, nothing else is displayed for about 30 minutes until "Firmware update has been completed." appears.	
	-f	Executes the command forcibly ignoring the warning.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	
	-s version	Specifies the version of the firmware. Specifies when checking, registering, or updating the firmware. Specifies the major version and minor version in <i>version</i> continuously.	
		The version of firmware is specified by four figures such as " <i>xxyy</i> ." The numbers have the following meanings.	
		xxMajor release numberyyMinor release number	
	-v	Displays detailed information. For details, see each operand.	

target	Specifies the target device. You can specify any of the link cards mounted in the PCI slot built in the host server, PCI Expansion unit, or FRU in the PCI Expansion unit.
	The link cards mounted in the slots of the host server are identified by <i>host_path</i> .
	<i>host_path</i> depends on the platform and indicates the path to the slot of the host server in which the link card is mounted. <i>host_path</i> is indicated in the following format. BB#0-PCI#0
	PCI Expansion unit is identified by the serial number.
	To refer to the serial number, use "PCIBOX# <i>nnnn</i> ." " <i>nnnn</i> " is the last four digits of the serial number of PCI Expansion unit.
	The FRU in PCI Expansion unit is identified as follows.
	PCIBOX# <i>nnnn</i> /IOB – I/O Board
	PCIBOX# <i>nnnn</i> /FANBP – Fan backplane
	PCIBOX# <i>nnnn</i> /PSU#0 – Power supply unit in the rear lower bay
	PCIBOX# <i>nnnn</i> /PSU#1 – Power supply unit in the rear upper bay
	PCIBOX# <i>nnnn</i> /FAN#0 – Fan unit in the front left bay
	PCIBOX# <i>nnnn</i> /FAN#1 – Fan unit in the front central bay
	PCIBOX# <i>nnnn</i> /FAN#2 – Fan unit in the front right bay

ioxadm(8)

OPERANDS	The following operat	nds are supported.
	env [-e] [-l] [-t] [<i>targe</i>	et [sensor]]
	Displays the su or link card.	ummary of the environment status of the PCI Expansion unit
	-e	Displays the status regarding electricity (measurement values of the voltage, fan speed, etc).
	-1	Displays the status of LED.
	-t	Displays the measurement value of the temperature sensor.
	target	See the section of <i>target</i> of the option. For the contents unique to the env operand, see the following.
	sensors	Specifies the sensor whose data is to be displayed. If not specified, the information on all sensors is displayed. It is specified with <i>target</i> .
		he PCI Expansion unit or link card in the slot of the host server <i>target</i> , env just displays the environment information on the
	are displayed.	options, -e, -l or -t is specified, the information on all sensors If no sensor is specified, the information on all sensors is <i>arget</i> is not specified, the information on all PCI Expansion yed.
	sensor measur	ansion unit is specified as <i>target</i> , env displays a list of the ement values for all FRUs in the specified PCI Expansion unit ard mounted in the host server.
	The options of	env can be used in any combinations.

The following information is also applied to env and the displayed result.

- The result is displayed in a table format. Each FRU is displayed in the first column. What is entered in the second column is the sensor name. It is displayed as T_INTAKE in the case of the intake-air temperature and V_12_0V in the case of the voltage measurement value of 12.0 V. The third, fourth, and fifth columns shows the sensor measurement value (Value), sensor resolution (Resolution), and unit(Units), respectively. See Example 1.
- Each FRU has various sensors. To specify multiple values in *sensor*, specify them separating the values with spaces. The values which can be specified in *sensor* are shown in the Sensor column of Example 1. Units displays the degrees C, voltage, LED, exhaust-air amount, power consumption, and RPM.
- The name of *sensor* depends on FRU and varies according to the type of FRU. It may vary among each FRU in some cases.
- If the -v option is specified, the detailed information is output. In addition to the normal output, the maximum value and minimum value (Max, Min) supported by the sensor as well as the upper and lower warning thresholds (Min Alarm, Max Alarm) are included in the outputs. The LED indicator does not support these fields.
 "-" indicates the field that is not supported.

list [target]

Displays the list of the PCI Expansion unit managed by the system.

If list is executed without specifying *target*, the list of the PCI Expansion unit is displayed. (One PCI Expansion unit is displayed in each line.) Each line includes the identifier unique to PCI Expansion unit and the name unique to the host of the link card. See Example 3.

If the command is executed by specifying the argument of PCI Expansion unit or the path of the link card, a single line including the specified FRU is displayed. If *host path* is specified, only the information of the link card is displayed. If the detailed option [-v] is set, the detailed information of FRU is included in the output. See Example 4 and 5.

locator [on | off] [target]

Sets or inquires about the status of the CHECK LED of the PCI Expansion unit (chassis locator).

If locator is executed without specifying an option, the current status of the LED regarding the specified FRU is output.

To use the field of the option, the *target* argument is essential. Only a PCI Expansion unit can be specified in *target*.

on	Blinks the CHECK LED.
off	Cancels the blinking of the LED.

If the chassis locator is blinking, "Fast" is displayed in the "Value" column for the PCI Expansion unit.

poweroff *target*

Powers off the specified FRU. Then, the corresponding LED is made to blink. It indicates that the FRU is removable. A power supply unit (PSU) or fan unit can be specified in *target*. If *target* is PSU, use it with the -f.

Note – The command cannot stop two or more power supply units or fan units in the same PCI box.

Note – The LED and fan may operate even if one of the power supply units is shut down, because they are powered from two power supply units.

poweron *target*

Powers on the specified FRU. Then, the corresponding LED is turned off. It indicates that the FRU is available. A power supply unit (PSU) or fan unit can be specified in *target*.

reset target

This operand is not supported.

setled [on | off | blink] target led_type

Sets the LED status.

off	Turns off the LED.
on	Turns on the LED.
blink	Makes the LED blink.

Only a PCI Expansion unit can be specified in *target*.

Only LOCATE can be specified in *led_type*.

Note – on is not supported.

serial target serial_num

Specifies a serial number of the PCI Expansion unit. This operand is used to re-register the serial number of the PCI Expansion unit when replacing the I/O board and Fan backplane at a time.

Only a PCI Expansion unit can be specified in *target*.

versionlist [target]

If either the PCI Expansion unit or the link card is specified in the target, the firmware version of each device is compared according to the combination of the PCI Expansion unit and the link card.

If "versionlist" is executed with specifying a target, the comparison result of firmware versions is displayed. Comparison result is displayed in tabular form. Each line contains information on the device name of the PCI Expansion unit, firmware version of the PCI Expansion unit, device name of the link card, firmware version of the link card and the comparison result (mismatch : there is some difference, equal: there is no difference). In case of "mismatch", the respective line starts with an asterisk. Please refer to example 7.

EXAMPLES EXAMPLE 1 Display the measurement values of the temperature, voltage, current, and fan speed sensors.

I

- **NAME** | password Sets the password of the XSCF user account and the effective period.
- **SYNOPSIS** password [-e days | date | NEVER] [-i inactive] [-M maxdays] [-n mindays] [-w warn] [user]

password -h

DESCRIPTION password is a command to set the password of the XSCF user account and the effective period of the password.

The password is specified within 32 characters. The following characters can be used.

- abcdefghijklmnopqrstuvwxyz
- ABCDEFGHIJKLMNOPQRSTUVWXYZ
- 0123456789
- !@#\$%^&*[]{}()_-+='~,></''?;:[SPACE]

If password is executed with one or more options specified, the effective period of the account is changed. For the default value, see setpasswordpolicy(8).

If password is executed with option omitted, the prompt to change the password is displayed.

If password is executed with the *user* operand omitted, the current user account becomes the target.

The user account must be local no matter whether the user name is specified. If the user account is not local, the password will cause an error.

The restrictions on the password applied to a current user account include the following.

- The password cannot be five or more sequential characters, such as "012345" or "zyxwvu".
- The password cannot be a palindrome, such as "qazwswzaq" or "qazwsswzaq".
- The password cannot match any National Insurance Number, represented by XXzzzzzX (X: capital letter, z: number), used in the United Kingdom.
- The password cannot match a word found in dictionaries or a proper name or the like.
- The password cannot match the user name.
- The password cannot be only slightly changed from the currently set password, for example, by changing lowercase letters to uppercase or uppercase letters to lowercase.

password(8)

Privileges	To execute this command, the following privileges are required.		
		The user can set the password and effective period of any user account.	
	the other privileges	The user can configure only its own password.	
	For details on user	r privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-e days∣date∣Neve	Sets the number of days of the effective period of the XSCF user account beginning today in <i>days</i> . 0 to 10730 can be specified.If the result of adding the value specified in <i>days</i> to the current date exceeds January 2038, the specified value becomes invalid and the command is not executed.	
		Sets the expiration date of the account in <i>date</i> . Specifies a date before January 2038. This can be specified using one of the following format.	
		<pre>mm/dd/yy (10/30/12) yyyy-mm-dd (2012-10-30) yy-mm-dd (12-10-30) dd-Mmm-yy (30-Oct-12) dd-Mmm-yyyy (30-Oct-2012) dd Mmm yy ("30 Oct 12") Mmm dd, yy ("Oct 30, 12") Mmm dd, yyyy ("Oct 30, 2012")</pre>	
		If a format including a space is used, put it in double quotation marks ("). This is not case-sensitive.	
		Never indicates that the account has already expired. This is not case-sensitive.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i inactive	Sets the number of days from the expiration of the password to account lock. This value is assigned when a new user account is created. The default is -1. If the value is -1, it indicates that the account is not locked even after the expiration of the password. This is specified with an integer from -1 to 999999999.	

	-M maxdays	Sets the maximum number of days when the password is effective. This value is assigned when a new user account is created. The default is 999999. This is specified with an integer from 0 to 9999999999.		
	-n mindays	Sets the minimum number of days from a change in the password to the next change. The default is 0. This indicate that the password can be changed at any time. This is specified with an integer from 0 to 999999999.		
		This value is assigned to a new user account when the account is created.		
	-w warn	Sets the number of days until the actual expiration after the issuance of the alarm of the expiration date of the password to the user. This value is assigned when a new user account is created. The default is 7. This is specified with an integer from 0 to 999999999.		
OPERANDS	The following oper	and is supported.		
	user S	pecifies the XSCF user account name.		
EXTENDED DESCRIPTION	• When the password is changed with another user specified in the <i>user</i> operand, the password policy of the system is not reflected automatically. Use the <i>user</i> operand if the default password of a new user is to be created, the user account expires, or you forget the password. Be sure to specify a password in compliance with the password policy of the system when changing the password of a current user account. You can execute showpasswordpolicy(8) to refer to the current password policy.			
	When a user with the useradm privilege executes the command, the user can set the password and effective period of another user account regardless of the value specified in the setpasswordpolicy(8) command. For example, they can set even in a case where the effective period of the specified user account is already specified with a different value.			
	In this case, the specified values	password and effective period will be overwritten with the		
EXAMPLES	EXAMPLE 1 Set the	expiration date of the password to February 2, 2012.		
	XSCF> password	-e 2012-02-02		
	EXAMPLE 2 Lock th	e account 10 days after the expiration of the password.		
	XSCF> password	-i 10		

password(8)

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	setpasswordpo	licy(8), showpasswordpolicy(8)	

NAME	ping - Sends the ECHO_REQUEST packet of ICMP to the host on the network.		
SYNOPSIS	ping [-c count] [-q] host		
	ping -h		
DESCRIPTION		nd to extract ECHO_RESPONSE from the specified host or eECHO_REQUEST datagram of ICMP.	
	XSCF and the spe	ecuted normally, you can determine that the network between ecified host or gateway is normal. It is also possible to measure the ance from the result.	
Privileges	To execute this co	ommand, any of the following privileges is required.	
	of the SSCP lir	alhost," the loop-back address "127.0.0.0/8," and the interface nk is specified in <i>host</i>	
	fieldeng		
	 Other than about the other than about		
	1 0	er privileges, see setprivileges(8).	
OPTIONS			
01 110103	The following op	tions are supported.	
	-c count	Specifies the frequency to send a packet. If the specified number of packets is sent and the responses are received, ping is terminated. If omitted, packets continue to be sent until termination by the user.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-d	Controls the output. Outputs only at the time of start and termination without displaying the progress.	
OPERANDS	The following operands are supported.		
	host	Specifies the host name or IP address to which a packet is to be sent.	
EXAMPLES	EXAMPLE 1 Send	a packet to the host name, scf0-hostname0, three times.	
	PING scf0-host 64 bytes from 64 bytes from	3 scf0-hostname0 name0 (192.168.1.100): 56 data bytes 192.168.1.100: icmp_seq=0 ttl=64 time=0.1 ms 192.168.1.100: icmp_seq=1 ttl=64 time=0.1 ms 192.168.1.100: icmp_seq=2 ttl=64 time=0.1 ms	

ping(8)

	scf0-hostname0 ping statistics 3 packets transmitted, 3 packets received, 0% packet loss round-trip min/avg/max = 0.1/0.1/0.1 ms		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		

NAME	poweroff - Shuts down the physical partition (PPAR).			
SYNOPSIS	poweroff [[-q] - {y n}] [-f] [-M] -p <i>ppar_id</i>			
	poweroff [$[-q] - \{y n\}$] $[-M] - a$			
	poweroff -h			
DESCRIPTION	poweroff is a co	ommand	to shut down PPAR.	
			cified PPARs. PPAR is shut down after the execution of the ssing for the Oracle Solaris.	
Privileges	To execute this co	ommand	l, any of the following privileges is required.	
	platadm, field	leng	Enables execution for all PPARs.	
	pparadm, pparm	ıgr	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privil	eges, see setprivileges(8).	
OPTIONS	The following options are supported.			
	-a	Shuts down all of the PPARs in operation. Only the users with the platadm and fieldeng privileges can specify this option. They shut down even during waiting for warm-up or air- conditioning, or start processing of PPARs.		
	-f	Forcibly shuts down the PPAR specified by XSCF. It is used with the $-p$ option.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-M	Displa	ys text one screen at a time.	
	-n	Auton	natically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the physical partition to be shut down. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> . It does not shut down during waiting for warm-up or air-conditioning, or start processing for PPAR.		
	-d	Prevents display of messages, including prompt, for standard output.		
	-У	-y Automatically responds to prompt with "y" (yes).		

```
EXTENDED
                   • When you execute the command, a prompt to confirm whether to execute it with
DESCRIPTION
                      the specified contents is displayed. To execute, press the [y] key. To cancel, press
                      the [n] key.

    If the Oracle Solaris of the logical domain is running, the shutdown processing

                      equivalent to the -i 5 option of shutdown is executed.
                   • You cannot shut down PPAR if the Oracle Solaris of the logical domain is in
                      operation. Execute poweroff again after completion of start.
                   • If the Oracle Solaris of the logical domain is running in the single user mode, you
                      cannot shut it down using poweroff. Execute shutdown by the logical domain.

    When you changed the configuration of the logical domain, execute the ldm

                      add-spconfig command on the control domain, to store the latest
                      configuration information in XSCF. If you do not store the information, the PPAR
                      stop processing may fail to work properly.

    If poweroff is executed, the shutdown result is displayed in the following

                      format for each of the specified PPARs.
                   Powering off
                                             Indicates normal end.
                                             Indicates error occurrence, which prevented shutdown.
                   Not powering off
                                             An error message is displayed with the result.
                   • You can confirm whether each PPAR on the system has shut down by using
                      showdomainstatus(8).
                   The shutdown process may take time, depending on the status of the guest
                      domain. For details, refer to "Chapter 6 Starting/Stopping the System" of Fujitsu
                      SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration
                      Guide.

    If poweroff is executed on the logical domain when any of the guest domains is

                      in a state other than "Active", the powering off takes time.
   EXAMPLES
                   EXAMPLE 1 Shut down all PPARs.
                     XSCF> poweroff -a
                     PPAR-IDs to power off:00,01,02,03
                     Continue? [y|n]:y
                     00:Powering off
                     01:Powering off
                     02:Powering off
                     03:Powering off
                     *Note*
                      This command only issues the instruction to power-off.
                     The result of the instruction can be checked by the "showpparprogress".
                     XSCF>
```

```
EXAMPLE 2 Shut down PPAR-ID 0.
                   XSCF> poweroff -p 0
                   PPAR-IDs to power off:00
                   Continue? [y|n]:y
                   00:Powering off
                   *Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showpparprogress".
                   XSCF>
                 EXAMPLE 3 Forcibly shut down PPAR-ID 0.
                   XSCF> poweroff -f -p 0
                   PPAR-IDs to power off:00
                   The -f option will cause domains to be immediately resets.
                   Continue? [y|n]:y
                   00:Powering off
                   *Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showpparprogress".
                   XSCF>
                 EXAMPLE 4 Shut down PPAR-ID 2. The prompt is automatically given a "y" response.
                   XSCF> poweroff -y -p 2
                   PPAR-IDs to power off:02
                   Continue? [y|n]:y
                   02:Powering off
                   *Note*
                    This command only issues the instruction to power-off.
                    The result of the instruction can be checked by the "showpparprogress".
                   XSCF>
                 EXAMPLE 5 Shut down PPAR-ID 2. The message is hidden and the prompt is automatical-
                            ly given a "y" response.
                   XSCF> poweroff -q -y -p 2
                   XSCF>
EXIT STATUS
                 The following exit values are returned.
                                  Indicates normal end.
                 0
                                  Indicates error occurrence.
                 >0

poweroff(8)

NAME	poweron - Starts the physical partition (PPAR).			
SYNOPSIS	poweron [[-q] - {y n}] [-M] -p <i>ppar_id</i>			
	poweron [[-q] - {y n}] [-M] -a			
	poweron -h			
DESCRIPTION	poweron is a con	nmand f	to start PPAR.	
	Starts all of the s	pecified	PPARs.	
Privileges	To execute this co	ommanc	l, any of the following privileges is required.	
	platadm, field	eng	Enables execution for all PPARs.	
	pparadm, pparm	gr	Enables execution for PPARs for which you have administration privilege.	
	For details on use	ails on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-a	the use this op	all of the PPARs whose setup has been completed. Only ers with the platadm or fieldeng privilege can specify otion. "PPAR whose setup has been completed" means whose setting has been completed by setupfru(8).	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-M	Displays text one screen at a time.		
	-n	Autom	natically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the physical partition to be started. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .		
	-d	Prevents display of messages, including prompt, for standard output.		
	-у	Autom	natically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION			command, a prompt to confirm whether to execute it with is displayed. To execute, press the [y] key. To cancel, press	

l

poweron(8)

```
    If poweron is executed, the start result is displayed in the following format for

                 each of the specified PPARs.
               Powering on
                                  Indicates normal start.
                                  Indicates error occurrence, which prevented start. An error
               Not Powering
                                  message is displayed with the result.
               on

    You can confirm whether PPAR has been started by using showhardconf(8).

EXAMPLES
               EXAMPLE 1 Start all PPARs.
                XSCF> poweron -a
                PPAR-IDs to power on:00,01,02,03
                Continue? [y|n]:y
                00:Powering on
                01:Powering on
                02:Powering on
                03:Powering on
                *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showpparprogress".
               EXAMPLE 2 Start PPAR-ID 0.
                XSCF> poweron -p 0
                PPAR-IDs to power on:00
                Continue? [y|n]:y
                00:Powering on
                *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showpparprogress".
                          Start PPAR-ID 0. The prompt is automatically given a "y" response.
               EXAMPLE 3
                XSCF> poweron -y -p 0
                PPAR-IDs to power on:00
                Continue? [y|n]:y
                00:Powering on
                *Note*
                 This command only issues the instruction to power-on.
                 The result of the instruction can be checked by the "showpparprogress".
                XSCF>
```

	EXAMPLE 4	Start PPAR-ID 1. The message is hidden and the prompt is automatically given a "y" response.
	XSCF> pc XSCF>	weron -q -y -p 1
EXIT STATUS	The follow	ing exit values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	rastest - Cause	s a fault virtually.			
SYNOPSIS	rastest -c {test hb}				
	rastest -h				
DESCRIPTION	rastest is a co	ommand to register an error lo	og after causing a fault virtually.		
	Error logs to be registered are defined for this command. The registered error logs can be shown by the showlogs(8).				
	While the SNMP agent is enabled, SNMP trap can be sent. For the SNMP agent settings, refer to setsnmp(8).				
	Warnings are not sent to remote maintenance service or email when rastest is executed. Moreover, components are not degraded and LED is also not lighted up. PPAR does not also panic and restart.				
	When the rastest is executed, it automatically determines the model of the system and according to the model, logs errors about the following FRUs as pseudo trouble spots.				
	Depending on the option, pseudo failure of any one of the following will occur.				
	test Record error logs on pseudo failures.				
		■ SPARC M12-1/M10-1			
		No. 1 pseudo faulty unit	/MBU /ODNU		
		No. 2 pseudo faulty unit No. 3 pseudo faulty unit	/OPNL /PSU#0		
		 SPARC M12-2/M10-4 	,100.00		
		No. 1 pseudo faulty unit	/BB#0/CMUL		
		No. 2 pseudo faulty unit	/BB#0/OPNL		
		No. 3 pseudo faulty unit	/BB#0/PSU#0		
		■ SPARC M12-2S/M10-4S			
		No. 1 pseudo faulty unit	/XBBOX#80/XBU#0		
		No. 2 pseudo faulty unit	/XBBOX#80/OPNL		
	No. 3 pseudo faulty unit /XBBOX#80/PSU#0				
		or			
		No. 1 pseudo faulty unit	/BB#0/CMUL		
	No. 2 pseudo faulty unit /BB#0/OPNL				
	No. 3 pseudo faulty unit /BB#0/PSU#0				

	 SPARC M. No. 1 pseud SPARC M. No. 1 pseud SPARC M. No. 1 pseud SPARC M. No. 1 pseud or No. 1 pseud 	o faulty unit /MBU	
Privileges	To execute this command, platadm or fieldeng privilege is required. For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-c hb Registers a	n error log of heart beat notifications.	
	-c test Registers a	n error log of suspected faults.	
		e usage. Specifying this option with another option causes an error.	
EXTENDED DESCRIPTION	 In case of suspected failure (-c test), the following error log is registered and trap is sent. Error log Date: May 30 17:10:45 JST 2013 Code: 8000000-003e01009301009600-ff02000100000000000000000000000000000

NAME	rebootxscf - Reboots XSCF.		
SYNOPSIS	rebootxscf [$[-q] - \{y n\}$] -a		
	rebootxscf [[-q]	$-\{y \mid n\}$] -b bb_id	
	rebootxscf [[-q] -{y n}] -s		
	rebootxscf -h		
DESCRIPTION	rebootxscf is a command to reboot XSCF.		
	The contents set by the following command is reflected in XSCF after rebootin XSCF by rebootxscf.		
	applynetwork(8)		
	■ setaltitude(8)		
	<pre>setntp(8)</pre>		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Reboots the XSCFs of all SPARC M12/M10 systems chassis and crossbar boxes. It cannot be executed from an XSCF other than a master XSCF.	
	-b bb_id	Reboots the XSCF of the specified <i>bb_id</i> . It cannot be executed from an XSCF other than a master XSCF. <i>bb_id</i> can be specified with an integer from 0 to 15 for a SPARC M12/M10 systems, and with an integer from 80 to 83 for crossbar box.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-d	Prevents display of messages, including prompt, for standard output.	
	-s	Reboots its own XSCF.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 		

rebootxscf(8)

	 When you execute the command, the connections between telnet, ssh, etc. and XSCF are disconnected. If -a is specified, the XSCFs of all SPARC M12/M10 systems chassis and crossbar boxes are rebooted. To just reboot an individual SPARC M12/M10 systems, specify -b bb_id. If XSCF reboot executed automatically by setdate(8) is cancelled, rebooting XSCF by rebootxscf again does not reflect the set contents in XSCF. 		
EXAMPLES	EXAMPLE 1 Reboot all XSCFs.		
	XSCF> rebootxscf - a The XSCF will be reset. Continue? $[y n]$: y		
	EXAMPLE 2 Reboot all XSCFs. The prompt is automatically given a "y" response.		
	XSCF> rebootxscf -y -a The XSCF will be reset. Continue? [y n]: y		
	EXAMPLE 3 Reboot its own XSCF. The message is hidden and the prompt is automatically given a "y" response.		
	XSCF> rebootxscf -q -y -s		
	EXAMPLE 4 Cancel reboot of its own XSCF in the middle. The prompt is automatically given a "n" response.		
	XSCF> rebootxscf -n -s The XSCF will be reset. Continue? [y n]: n XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	applynetwork (8), setdate (8)		

NAME	replacefru - Replaces the Field Replaceable Unit (FRU) and chassis.			
SYNOPSIS	replacefru			
	replacefru –h			
DESCRIPTION	replacefru is a command to replace the FRU and chassis.			
	You can interactively select, confirm, replace, etc. the FRU and chassis required for replacement of FRU in the menu format.			
	With replacefru, the following FRUs and chassis can be replaced.			
	■ SPARC M10-1/M10-4			
	 Fan unit for the SPARC M10-1/M10-4 (BB/FAN) 			
	 Power supply unit for the SPARC M10-1/M10-4 (BB/PSU) 			
	■ SPARC M10-4S			
	 SPARC M10-4S (BB) 			
	 Fan unit for the SPARC M10-4S (BB/FAN) 			
	 Power supply unit for the SPARC M10-4S (BB/PSU) 			
	 Fan unit for the crossbar box (XB-Box/FAN) 			
	 Power supply unit for the crossbar box (XB-Box/PSU) 			
	• XSCF unit for the crossbar box (XB-Box/XSCFU)			
	■ SPARC M12-1/M12-2			
	 Fan unit for the SPARC M12-1/M12-2 (BB/FAN) Power supply unit for the SPARC M12-1/M12-2 (BB/PSU) SPARC M12-2S SPARC M12-2S (BB) 			
	Fan unit for the SPARC M12-2S (BB/FAN)			
	 Power supply unit for the SPARC M12-2S (BB/PSU) 			
	• XSCF unit for the SPARC M12-2S (BB/XSCFU)			
	Fan unit for the crossbar box (XB-Box/FAN)			
	 Power supply unit for the crossbar box (XB-Box/PSU) XSCE unit for the grossbar box (XB Box (XSCEL)) 			
	 XSCF unit for the crossbar box (XB-Box/XSCFU) 			
Privileges	To execute this command, fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			

OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	 Depending on the implementation status of the FRU which is to be replaced or the status of the chassis, replacement may not be executed. In such a case an error message, stating that the target FRU or chassis cannot be selected, will be displayed. 		
	In the following conditions, replacement is not possible.		
	 Common to all FRUs and chassis 		
	The target chassis (if the target is a FRU, then the chassis on which it is mounted) is in any of the following states.		
	- In the middle of firmware updating		
	- Not in the state of "SCF READY"		
	 FAN for the SPARC M12-2S/M10-4S and crossbar box 		
	Due to removal for replacement, if the number of connected devices becomes less than the minimum number of devices required to start the chassis.		
	However, the minimum number of connected devices that is required to start a chassis depends on the model and the power status.		
	 PSU for the SPARC M12-2S/M10-4S and crossbar box 		
	If there is only one PSU which is running normally.		
	 XSCFU for the SPARC M12-2S 		
	- In case the target XSCF unit is mounted on the master chassis.		
	- If the target SPARC M12-2S is undergoing maintenance or not mounted.		
	- In the middle of user setting operations involving power control, system configuration change, or XSCF restart.		
	- In the middle of power-on of the target SPARC M12-2S when replacement work cannot be performed because the operating state of the incorporating PPAR or the non-replacement target XSCFU in the PPAR is as follows.		
	The replacement target XSCFU is not faulty, and the non-replacement target XSCFU is faulty.		
	The non-replacement target XSCFU is restarting.		
	The PPAR is being powered on or off.		
	The operating state of the control domain is not "Solaris running."		
	There is a violation of CPU Activation.		
	 XSCFU for the crossbar box 		
	In case the target XSCF unit is mounted on the master chassis.		

a powered on state - If there is a chassis which has the same BB-ID as the target SPARC M12-2S/ M10-4S, but was not implemented in any system before				
• In case the target is any FRU other than an XSCF unit or the target is a chassis, removal only of this target can be executed by canceling all other procedures just after the removal of the target FRU or the chassis. In such case, the target FRU or chassis will have the state of maintenance. To consummate the maintenance status, undergo maintenance of the FRU or chassis, using the replacefru				
Note – Removal of the chassis, as stated above, is a temporary removal of the chassis from the system for maintenance purposes. Information on the target system, like serial number etc., are not deleted. Moreover, the removed chassis is also not initialized. To permanently remove a chassis from a system, use the initbb(8).				
 It is not possible to add a chassis anew with a BB-ID whose information is not registered in the system, using the replacefru. In such a case, use the addfru(8) to add the chassis. 				
The following exit values are returned.				

replacefru(8)

NAME	reset - Resets the specified physical partition (PPAR) or a logical domain.			
SYNOPSIS	reset [[-q] - {y n}] -p <i>ppar_id</i> por			
	reset [[-q] -{y n}] -p <i>ppar_id</i> -g <i>domainname</i> sir			
	reset [[-q] -{y	n}] -p ppar_id -g domainname panic		
	reset [[-q] -{y	n}]-p ppar_id xir		
	reset -h			
DESCRIPTION	Note – reset may cause a failure of the disk, etc. because it forcibly resets the system. This shall be used exclusively for recovery in the case of hang-up of the Oracle Solaris, etc.			
	reset is a comm	and to reset the specified PPAR or the logical domain.		
	The following for	ar types can be specified as the reset method.		
	por	Resets PPAR.		
	sir	Resets the logical domain.		
	panic	Orders panic to the Oracle Solaris of the logical domain. It is ignored during shutdown processing or under suspension.		
	xir	Resets all CPUs in PPAR.		
	If PPAR is reset with specifying xir, the PPAR is restarted with the logical domain configuration as factory-default, and a hypervisor dump file is collected. For details, refer to "8.13 Collecting a Hypervisor Dump File" of <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide</i> .			
Privileges	To execute this command, any of the following privileges is required.			
	platadm, field	eng Enables execution for all PPARs.		
	pparadm, pparm	gr Enables execution for PPARs for which you have administration privilege.		
	For details on user privileges, see setprivileges(8).			

reset(8)

OPTIONS	The following options are supported.		
	-g domainname	Specify the logical domain name of the logical domain that is to be reset. It can be specified only if panic or sir is specified in <i>level</i> . When the control domain is reset, the logical domain name should be fixed at "primary".	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies only one PPAR-ID to be reset. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
	-đ	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
OPERANDS	The following operands are supported.		
	por	Resets PPAR.	
	sir	Resets the logical domain.	
	panic	Orders panic to the Oracle Solaris of the logical domain.	
	xir	Resets all CPUs in PPAR.	
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 		
	 You can confirm the current status of PPAR after ordering reset by using showhardconf(8). If reset is executed in the following status, the processing is stopped before the Oracle Solaris is started. 		
	 The autobo setpparmo 	ot function for the specified guest domain is disabled in ode(8).	
		ot function for the logical domain is disabled in OpenBoot PROM nt variable, auto-boot?.	
	logical domain	ng the configuration of logical domains, render the state of all ns to either "active" or "bound" and then execute the ldm add- nmand on the control domain to store the latest configuration a XSCF.	

In case there is even one logical domain which was not in either "active" or "bound" state when configuration information was stored in XSCF, if that logical domain was specified with the -g option, any of the following symptoms will occur: The reset command will fail. A different logical domain will be reset. **EXAMPLES EXAMPLE 1** Reset "GuestDomain0001" which is the logical domain of PPAR-ID 0. XSCF> reset -p 0 -g GuestDomain0001 sir PPAR-ID:00 GuestDomain to sir:GuestDomain0001 Be sure to execute "ldm add-spconfig" before using this command when you have changed the ldm configuration. Otherwise, an unexpected domain might be reset. Continue? [y|n] :y 00 GuestDomain0001 :Resetting *Note* This command only issues the instruction to reset. The result of the instruction can be checked by the "showdomainstatus". XSCF> **EXAMPLE 2** Reset the CPU of PPAR-ID 0. The prompt is automatically given a "y" response. XSCF> reset -y -p 0 xir PPAR-ID to reset:00 Continue? [y|n]:y 00 :Resetting *Note* This command only issues the instruction to reset. The result of the instruction can be checked by the "showpparprogress". XSCF> **EXAMPLE 3** Reset PPAR-ID 0 immediately. The message is hidden and the prompt is automatically given a "y" response. XSCF> reset -q -y -p 0 por XSCF> **EXAMPLE 4** Cancel the executed reset in the middle. XSCF> reset -p 0 -g GuestDomain0001 sir PPAR-ID :00 GuestDomain to sir:GuestDomain0001 Be sure to execute "ldm add-spconfig" before using this command when you have changed the ldm configuration.

	Otherwise, an Continue? [y r XSCF>	unexpected domain might be reset. n]: n
EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	poweroff(8), po showpparprogre	oweron(8), setpparmode(8), showpparstatus(8), ss(8)

NAME	resetdateoffset - Resets the difference between the system time and the time of each physical partition (PPAR).		
SYNOPSIS	resetdateoffset [[-q] - {y n}] -p <i>ppar_id</i>		
	resetdateoffset [[-q] -	[y n}] [-a]
	resetdateoffset -	h	
DESCRIPTION	resetdateoffset is a command to reset the difference between the system managed by XSCF and the time managed by each PPAR.		
	In XSCF, the difference between the system time and the time of each PPAR is stored If system time has been changed either by the setdate(8) or by synchronization with an NTP server, the difference between the time of each PPAR and the changed system time is updated. The stored difference of the time is retained even if PPAR or the system is restarted.		hanged either by the setdate(8) or by synchronization ifference between the time of each PPAR and the changed The stored difference of the time is retained even if PPAR
	resetdateoffset resets the difference between the system time and the time of each PPAR. Thanks to this, the time of each PPAR after restart is set to the same time as the system time.		
			et is to be used only at the time of initial configuration of ot use resetdateoffset at any other time.
Privileges	To execute this command, any of the following privileges is required.		
	platadm, fieldeng		Enables execution for all PPARs.
	pparadm		Enables execution for PPARs for which you have administration privilege.
	For details on us	er privile	eges, see setprivileges(8).
OPTIONS	The following options are supported.		
	-a	Initiali	zes the differences form the time of all PPARs.
	-h		ys the usage. Specifying this option with another option causes an error.
	-n	Autom	atically responds to prompt with "n" (no).
	-p ppar_id	-	es the PPAR-ID to reset the time difference. Depending on tem configuration, you can specify an integer from 0 to 15 r_{id} .
	-d	Preven output	ts display of messages, including prompt, for standard

	-y Automatically responds to prompt with "y" (yes).		
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 		
	 If no option is specified, the differences form the time of all PPARs are reset. 		
	 resetdateoffset shall be executed after PPAR has been shut down. 		
EXAMPLES	EXAMPLE 1 Initialize the difference between the system time and the time of PPAR-ID 1.		
	XSCF> resetdateoffset -p 1 Clear the offset of PPAR-ID 1? $[y n] : y$ XSCF>		
	EXAMPLE 2 Initialize the differences between the system time and the times of all PPARs.		
	XSCF> resetdateoffset -a Clear the offset of all PPARs? $[y n] : y$ XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	restorecodactivation - Restores the CPU Activation key.			
SYNOPSIS	<pre>restorecodactivation [-v] [-V] [[-q] - {y n}] [-P password] [-u user] [-p proxy [-t proxy_type]] url</pre>			
	restorecodactiva	tion -h		
DESCRIPTION		ivation is a command to restore the CPU Activation key, which g the dumpcodactivation(8), to XSCF.		
Privileges	To execute this command, platadm or fieldeng privilege is required. You can execute it even with the default account initially prepared in the system.			
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following op	ptions are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-n	Automatically responds to prompt with "n" (no).		
	-₽ password	Specifies the password to decode encrypted files. If the -P option is omitted when you restore the encrypted CPU Activation key, the command prompts for the password. You can specify this using up to 128 characters.		
	-p proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> .		
	-q Prevents display of messages, including prompt, for standard output.			
	-t <i>proxy_type</i> Specifies the proxy type. It is specified with the -p option. You can specify any of http, socks4, and socks5. The default is http.			
	-u user	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry. You can specify this using up to 127 characters.		
	-V	Displays detailed information. This option is used to diagnose server problems.		
	-V	Displays detailed network activities. This option is used to diagnose network and server problems.		
	-y Automatically responds to prompt with "y" (yes).			

I

OPERANDS	The following operands are supported		
	<i>url</i> Specifies the URL storing the CPU Activation key. The following types of format are supported.		
	Specify an absolute path for a file.		
	<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>		
EXTENDED DESCRIPTION	 The beginning of the CPU Activation key which has been saved contains the basic identification information in text format. Using the text viewer, you can confirm the following information. 		
	 System at the time when the CPU Activation key was saved 		
	 Date when it is saved 		
	• Whether it is encrypted		
	 It is necessary to shut down all physical partitions (PPARs) before executing restorecodactivation. 		
	 CPU Activation key can only restore the data that was saved from a system with the same system serial number. 		
EXAMPLES	EXAMPLE 1 Restore the CPU Activation key which is saved on USB device.		
	XSCF> restorecodactivation -v -V file:///media/usb_msd/cpukey.cfg initiating file transfer from 'file:///media/usb_msd/cpukey.cfg' transfer from		
	'file:///media/usb_msd/cpukey.cfg' to '/ssd/transferred_file_cod.bin' * Closing connection #0 done.		
	*** The CPU core Activation keys are overwritten in the backup data. *** Do you want to restore this keys to your system? $[y n]: \mathbf{y}$ operation completed		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	restoreconfig - Restores the XSCF configuration information.			
SYNOPSIS	<pre>restoreconfig [-v] [-V] [[-q] - {y n}] [-P password] [-s network={yes no}] [-u user] [-p proxy [-t proxy_type]] url</pre>			
	restoreconfig -h			
DESCRIPTION	restoreconfig is a command to restore the XSCF configuration information saved by dumpconfig in XSCF.			
	The following are regarded as the XSCF configuration information.			
	 System specific information 			
	System specific information of each system includes the following information on the place of installation or network information etc.			
	 NTP: NTP configuration 			
	 Altitude configuration 			
	 Power capping: power capping configuration 			
	 Power supply scheduling: power supply scheduling configuration, enable/ disable scheduling, power recovery mode 			
	 Remote Power Management (RCIL): Remote Power Management configuration, Remote Power Management group configuration 			
	 XSCF network: take-over IP address, SSCP, host name, domain name, routing, DNS configuration, IP packet filtering rules 			
	 SSH/Telnet service: SSH service configuration, Telnet service configuration hot public key, user public key, timeout value 			
 HTTPS service: HTTPS service configuration, certification authority server private key, web server certificate 				
	 Remote maintenance service configuration information: REMCS configuration 			
	 CPU activation information: CPU activation key, CPU core resource information 			
	 Logical domain configuration information: logical domain configuration, startup reservation information 			
	 OpenBoot PROM environment variable configuration information: Oracle Solaris/OpenBoot PROM configuration 			
	 Verified Boot: Information of X.509 public key certificates used for performing Verified Boot of Oracle Solaris 			
	 Remote storage: Connection settings to remote storage 			
	 System common information 			
	System common information includes the following information that are used among systems.			

restoreconfig(8)

- User administration: user account, password policy, password, user privilege, lockout feature
- Audit: audit configuration
- Time: time zone, daylight saving time
- Warm-up operation time: warm-up operation time configuration
- Dual power feed: dual power feed configuration
- Air conditioning wait time: wait time before the system startup configuration
- Direct I/O function: enable/disable direct I/O function to PCI card mounted on a PCI expansion unit
- SSH/Telnet service: timeout value
- LDAP service: LDAP client, enable/disable LDAP
- Active Directory service: Active Directory client
- LDAP over SSL service: LDAP over SSL client
- Mail notification: SMTP configuration, mail notification function
- SNMP: SNMP agent, trap host, v3 trap host, User-based Security Model (USM) management information, View-based Access Control Model (VACM) management information
- System Board configuration: memory mirroring
- Remote maintenance service configuration information: ASR feature (enable/ disable service tag)
- Physical partition configuration information: allocation status of physical partitions in PSB, configuration policy, I/O nullification option
- Physical partition mode configuration
- OpenBoot PROM environment variable configuration information: XSCF configuration
- High speed mode of the CPU of SPARC M12-2S

XSCF configuration information can be restored only to a server of the same model as the one on which the XSCF configuration information was saved by dumpconfig(8).

XSCF configuration information can be restored with the combination of the server on which it is to be restored and the -s network option in the following ways:

When restoring to the system on which the XSCF configuration information was saved:

Regardless of the value specified by the -s network option, both the system specific information and the system common information will be restored.

When restoring to a different system from the one on which the XSCF configuration information was saved:

		(default value) is specified, only the system common restored and system specific information will remain the		
		is specified, both the system specific information and the prmation will be restored.		
	This command confirms the consistency of the XSCF configuration information, searches the network information, and verifies whether the version of the XSCF configuration information file and system class match.			
	information is saved in	n information file is a file in which the XSCF configuration the base64 encoded text format. Users can specify any name encrypted by specifying the -e option.		
Privileges	To execute this command, platadm privilege is required. You can execute it even with the default account initially prepared in the system.			
	For details on user priv	ileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-n	Automatically responds to prompt with "n" (no).		
	-P password	Specifies the password to decode encrypted files. If the –P option is omitted when you restore the encrypted XSCF configuration information, the command prompts for the password. You can specify this using up to 128 characters.		
	-p proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> . See Example 3.		
	-d	Prevents display of messages, including prompt, for standard output.		

 When restoring to the system configuration information was

l

EXTENDED DESCRIPTION

• At the head of the XSCF configuration information, the basic identification information is contained in the text format. The following information can be confirmed using a text viewer.

- System at the time when the XSCF configuration information was saved
- Date when it is saved
- Whether it is encrypted
- Execute the restoreconfig command while the system is shut down. If the system is not shut down, it causes an error.

The system shutdown status means the status in which all PPARs are shut down. If it is in operation, all PPARs are shut down by executing poweroff -a and then the power of the system is turned off. You can check the system power status by executing showhardconf(8) and referring to the "System_Power:" display ("On" or "Off").

 restoreconfig downloads the XSCF configuration information and verifies whether the information is correct. When authentication is finished, XSCF is rebooted and data is restored.

Note – If XSCF configuration information which was saved by dumpconfig(8), is restored by restoreconfig on the same chassis or on a different chassis, confirm that the XSCF configuration information has been properly restored.

Note – When powering on the PPAR after restoration using the restoreconfig command, set the time of Oracle Solaris on each logical domain by time synchronization with an NTP server or by using the date command on each logical domain.

EXAMPLES EXAMPLE 1 Restore the XSCF configuration information using USB.

```
XSCF> restoreconfig -v -V file:///media/usb_msd/system.cfg
Making sure mount point is clear
umount: /media/usb_msd is not mounted (according to mtab)
Trying to mount USB device /dev/sdb1 as /media/usb msd
mount: I could not determine the filesystem type, and none was specified
Trying to mount USB device /dev/sdb as /media/usb_msd
Mounted USB device
obtaining lock ... done
initiating file transfer from 'file:///media/usb_msd/system.cfg' ...
transfer from
'/ssd/transferred_file.bin' to 'file:///media/usb_msd/system.cfg'
* Closing connection #0
Unmounted USB device
done
file decoding done.
Configuration backup created on Tue Oct 9 10:31:22 2012
 from system 'M10-4S' with serial number '2081208014', version '0001'
validating backup configuration data

EXIT STATUS	: *** Do you want to restore this configuration to your system? [y/n]: y requesting XSCF reboot to perform restore requested The following exit values are returned.		
	0 Indicates normal end.>0 Indicates error occurrence.		
SEE ALSO	dumpconfig(8), restorecodactivation(8)		

NAME	restoredefaults - Restores settings of the XSCF unit and its back-up information to the factory default.		
SYNOPSIS	restoredefaults -c factory [-r activation]		
	restoredefaults -	-c xscf	
	restoredefaults -	h	
DESCRIPTION		ts is a command to restore settings of XSCF unit and its back-up le factory default.	
		predefaults, connect to XSCF by serial. If connected by XSCF- k connection is disconnected during execution.	
	The following ty	pes of initialization scope can be specified.	
	factory	Restores the entire system to factory settings. Clears information of user settings and errors, out of setting and back-up information of the XSCF unit.	
	xscf	Restores the XSCF unit to factory settings. User settings, error information, and CPU Activation keys of the XSCF unit are cleared.	
	■ For SPARC M	12-1/M10-1	
	The configuration information of the XSCF mounted unit will be saved in the XSCF unit on the motherboard unit (MBU), but its backup information will be saved in the PSU backplane (PSUBP).		
	■ For SPARC M10-4/M10-4S (without crossbar box)		
	The configuration information of the XSCF mounted unit will be saved in the XSCF unit on the CPU Memory Unit (Lower) (CMUL), but its backup information will be saved in the PSU backplane unit (PSUBP).		
	■ For SPARC M12-2/M12-2S (without crossbar box)		
	The configuration information of the XSCF mounted unit will be saved in the XSCF unit, but its backup information will be saved in the PSU backplane unit (PSUBP).		
	■ For SPARC M12-2S (with crossbar box)/M10-4S (with crossbar box)		
	The configuration information of the XSCF mounted unit will be saved in the XSCF interface unit (XSCFIF), but its backup information will be saved in the crossbar backplane unit (XBBP).		
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
	For details on user privileges, see setprivileges(8).		

restoredefaults(8)

OPTIONS	The following options are supported.		
	-c factory	Restores the entire system to the default.	
	-c xscf	Restores setting information of the XSCF unit to the factory default and deletes CPU Activation keys.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-r activation	Deletes CPU Activation keys. It is used to delete CPU Activation keys while specifying -c factory.	
		You cannot specify this option with "-c xscf".	
EXTENDED DESCRIPTION	 restoredefa with showbbs 	ults is executed by the master XSCF. Confirm the master XSCF tatus(8).	
	 In use of SPARC M12-2S/M10-4S, be sure to execute restoredefaults only on a single SPARC M12-2S/M10-4S. Executing it with multiple SPARC M12-2S/M10- 4S connected causes an error. 		
	 After restoredefaults is executed, the XSCF configuration information is shut down. After shutdown, turn off the input power of the system and turn it on again. 		
	• If you specify "-c xscf", the back-up information remains. Therefore, when the system is powered off then on, the information that has been saved is read and the XSCF unit settings are restored to its previous state before being restored. However, the CPU Activation key will be deleted along with the XSCF unit information and its back-up information.		
		ults shall be executed with the system shut down. If the system wn, it causes an error.	
	physical partit poweroff -a turned off. Exe	which the system is shut down means the status in which all ions (PPARs) are shut down. If PPAR is in operation, executing shuts down all PPARs and after that the power of the system is ecute the showhardconf(8) and see the display of r:" ("On" or "Off"), to confirm the condition of system power.	
	system is not c	ctory" is specified, the information of CPU Activation keys in the leared. To clear the information of CPU Activation keys, be sure to tivation" too.	
	back-up inform dumpcodacti saved CPU Ac	s specified, CPU Activation keys, registered to XSCF unit and its nation, are deleted. To save CPU Activation keys, run vation(8) to save CPU Activation keys beforehand. To restore the tivation keys, execute restoredefaults -c xscf, then ctivation(8).	
		e restoredefaults was executed before saving the CPU you must register a CPU Activation key again.	

 An error occurs if "-c factory" is specified when PSU backplane and crossbar backplane are not installed.

```
EXAMPLES EXAMPLE 1 Restoring the XSCF unit to factory settings and clears CPU Activation keys.
```

XSCF> restoredefaults -c xscf

WARNING:

```
If this system does not have BACK UP, this command will set all the user
settable XSCF configuration parameters to their default value as they
were set when the system was shipped out.
Furthermore, this command will delete all logs in the intended chassis XSCF.
Check the man page of this command before you run it.
```

NOTE:

The CPU core Activation keys will be also removed.

Continue?[yes/no](default no):**yes** You must check the following points.

- 1. Have the ability to power cycle the system.
- 2. Have access to the serial console and hold the serial console of the XSCF to confirm the completion of the command.

If you answer "yes" this command will HALT the XSCF when it completes. You will need to power cycle the system after the XSCF BOOT STOP.

Do you really want to continue?

XSCF clear : start

<snip>

XSCF clear : complete

Please turn off the breaker after XSCF halt.

```
Restoring the entire system to factory settings. In this case, CPU Activa-

NAME	sendbreak - Sends a break signal to the control domain of the specified physical partition (PPAR).		
SYNOPSIS	sendbreak [[-	q]-{y n}]-р <i>ppar_id</i>	
	sendbreak -h		
DESCRIPTION	sendbreak is a specified PPAR.	command to send a break signal to the control domain of the	
	console, the cont	is sent to the Oracle Solaris on PPAR from the control domain rol is transferred from Oracle Solaris to OpenBoot PROM and the Boot PROM (ok) is displayed.	
	signal transmissi	ode switch of the operator panel is set to "Locked," setting the break ion suppression of setpparmode(8) to "on" prevents transmission . For details, see setpparmode(8).	
Privileges	To execute this c	ommand, any of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies PPAR-ID to which a break signal is to be sent. Depending on the system configuration, you can specify only one integer from 0 to 15 for <i>ppar_id</i> .	
	-d	Prevents display of messages, including prompt, for standard output.	
	-У	Automatically responds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.		

sendbreak(8)

EXAMPLES	EXAMPLE 1 Send a break signal to the control domain of PPAR-ID 0.			
	<pre>XSCF> sendbreak -p 0 Send break signal to PPAR-ID 0?[y n] : The following exit values are returned.</pre>

NAME	setad - configure Active Directory.		
SYNOPSIS	setad {enable disable}		
	<pre>setad loadcert [[-q] - {y n}] [-i n] [-u username] [-p proxy [-t proxy_type]] URL</pre>		
	<pre>setad loadcert [[-q] - {y n}][-i n] console</pre>		
	setad rmcert [[-q] - {y n}] [-i n]		
	<pre>setad group {administrator operator custom}-i n name [groupname]</pre>		
	setad group custom -i n roles [privileges]		
	setad userdomain -i n [domainname]		
	<pre>setad defaultrole [privileges]</pre>		
	setad timeout seconds		
	<pre>setad server [-i n] [ipaddr [: port]]</pre>		
	<pre>setad logdetail {none high medium low trace}</pre>		
	<pre>setad log [[-q] - {y n}] clear</pre>		
	<pre>setad {dnslocatormode expsearchmode strictcertmode} {enable disable}</pre>		
	setad dnslocatorquery -i n [service]		
	<pre>setad default [[-q] - {y n}]</pre>		
	setad -h		
DESCRIPTION	setad configures Active Directory. To simply enable or disable Active Directory, execute the command with only those operands. To enable or disable an Active Directory mode, such as dnslocatormode, specify the mode along with enable or disable.		
	To clear or unset a property, issue a setad command with no value for the operand. For example, setad group custom -i 1 name clears the name property from group 1. If a property is not set, it is displayed with no value.		
	Note – If you are an Active Directory or LDAP over SSL user, do not upload a public key. If one has already been uploaded, use the following command to delete it: XSCF> setssh -c delpubkey -a -u proxyuser		
Privileges	You must have useradm privileges to run this command.		

setad(8)

	Refer to setpri	vileges(8) for more information.	
OPTIONS	The following options are supported:		
	-h	Displays usage statement. When used with other options or operands, an error occurs.	
	-i <i>n</i>	Sets an index marker, value 1 - 5. The target of index marker differs according to the operand.	
		group Index marker of the group	
		userdomain Index marker of the user domain	
		server, loadcert, rmcert Index marker of the alternate Active Directory Server	
		dnslocatorquery Index marker of the DNS server	
	-n	Automatically answers "n" (no) to all prompts.	
	-p	Specifies the proxy server to be used for transfers. The default transfer type is http, unless modified using the -t <i>proxy_type</i> option. The value for proxy server must be in the format <i>servername</i> [: <i>port</i>]. See EXAMPLE 8.	
	-d	Suppresses all messages to stdout, including prompts.	
	-t proxy_type	Use with the -p option to specify proxy type as http, socks4, or socks5. The default is http.	
	-u <i>username</i>	Specifies the user name when logging in to a remote ftp or http server that requires authentication. Prompts for a password. See EXAMPLE 9.	
	-У	Automatically answers "y" (yes) to all prompts.	
OPERANDS	The following o	perands are supported:	
	enable	When used with no other operands, enable the Active Directory feature.	
	disable	When used with no other operands, disable the Active Directory feature.	

loadcert console	Prompts for certificate information to be entered at the console. Use this command to paste certificate information copied from a file. Terminate input with CTRL-D.
	Set to the primary Active Directory server when -i is omitted. Set to the alternate Active Directory server when -i is specified.
loadcert URL	Load a certificate file for the Active Directory server. Supported formats for <i>URI</i> are:
	Specify an absolute path for a file.
	<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>
	Set to the primary Active Directory server when -i is omitted. Set to the alternate Active Directory server when -i is specified.
rmcert	Delete certificate file for the Active Directory server. strictcertmode must be in the disabled state for a certificate to be removed.
	Set to the primary Active Directory server when -i is omitted. Set to the alternate Active Directory server when -i is specified.
group administrator name	If <i>groupname</i> is specified, the group name is assigned to the name property of the administrator group specified by the index marker. The administrator group has the platadm, useradm and auditadm permissions, which cannot be changed. If <i>groupname</i> is omitted, the name property of the administrator group specified by the index marker, is deleted.
group operator name	If <i>groupname</i> is specified, the group name is assigned to the name property of the operator group specified by the index marker. The operator group has the platop and auditop permission which cannot be changed. If <i>groupname</i> is omitted, the name property of the operator group specified by the index marker, is deleted.
group custom name	If <i>groupname</i> is specified, the group name is assigned to the name property of the group specified by the index marker. If <i>groupname</i> is omitted, the name property of the group specified by the index marker, is deleted.

group custom role	s If <i>privileges</i> is specified, the role property of the group specified by the index marker is assigned to the group. If <i>privileges</i> is omitted, the role property of the group specified by the index marker is deleted.
userdomain	Configure the specified user domain. A user domain can be configured explicitly through the setad userdomain command on XSCF, or entered at the login prompt using the form, <i>user@domain</i> .
	If a user domain is specified at the login prompt – for example, login: ima.admin@dc01.example.com – that user domain is used for this login attempt. Any pre-configured user domains (as displayed by showad userdomain) are ignored.
	 If a user domain is not specified at the login prompt – for example, login: ima.admin – XSCF checks each of the pre-configured user domains, in turn, to authenticate the user.
defaultrole	Configure default privileges. If defaultrole is configured, users have privileges as specified by defaultrole after authentication; user group membership is not checked. If defaultrole is not configured, users' privileges will be learned from Active Directory based on group membership.
timeout seconds	Configure transaction timeout, in seconds. <i>seconds</i> can be 1 to 20. The default is 4. If the specified timeout is too brief for the configuration, the login process or retrieval of user privilege settings could fail.
server	Configure the primary and up to five alternate Active Directory servers. To use a host name, DNS must be enabled. An IP address can be specified with port number; otherwise, the default port is used.
	Set to the primary Active Directory server when -i is omitted. Set to the alternate Active Directory server when -i is specified.

logdetail	Enable logging of Active Directory authentication and authorization diagnostic messages at the specified detail level. This log is for use in troubleshooting and is cleared on SP reboot. Level can be one of the following:	
	none	Do not log diagnostic messages. Use this setting during normal system operation
	high	Log only high-severity diagnostic messages
	medium	Log only high-severity and medium- severity diagnostic messages
	low	Log high-severity, medium-severity, and informational diagnostic messages
	trace	Log high-severity, medium-severity, informational, and trace-level diagnostic messages
log clear	Clear the log file of Active Directory authentication and authorization diagnostic messages.	
dnslocatormode	Enable or disable DNS locator mode. This mode is disabled by default. If enabled, XSCF queries a DNS server to learn the Active Directory server to use for user authentication.	
expsearchmode	Enable or disable expanded search mode. The default Active Directory functionality is intentionally restrictive to ensure proper security. Search criteria can be expanded to accommodate specific customer environments. The expanded search mode is disabled by default, which means the UserPrincipalName (UPN) is expected to have a fully qualified domain name suffix. When expanded search mode is enabled, more searches are attempted if the more specific UPN search does not immediately succeed.	

setad(8)

	strictcertmode	Enable or disable strictcertmode mode. This mode is disabled by default; the channel is secure, but limited validation of the certificate is performed. If strictcertmode is enabled, the server's certificate must have already been uploaded to the server so that the certificate signatures can be validated when the server certificate is presented. Data is always protected, even if strictcertmode is disabled. Strictcertmode applies to primary and alternate servers alike.		
	dnslocatorquery	Configure the DNS locator query. DNS and DNS Locator Mode must be enabled for DNS Locator Queries to work. The DNS Locator service query identifies the named DNS service. See EXAMPLES, below, for important information.		
	default	Reset Active Directory settings to factory default.		
EXAMPLES	EXAMPLE 1 Configures the default	the Active Directory primary server, specifying a port other than .		
	XSCF> setad serve	r 10.1.12.250:4040		
	EXAMPLE 2 Sets name for administrator group 3. XSCF> setad group administrator -i 3 name CN=spSuperAdm OU=Groups, DC=Sales, DC=aCompany, DC=com			
	EXAMPLE 3 Sets name for custom group 2.			
	XSCF> setad group custom -i 2 name CN=spLimitedAd OU=Groups,DC=Sales,DC=aCompany,DC=com			
	EXAMPLE 4 Sets roles for custom group 2.			
	XSCF> setad group custom -i 2 roles auditadm,platop			
	EXAMPLE 5 Loads certi	ficate information for Alternate Server 4 from the console.		
	XSCF> setad loadcert -i 4 console Warning: About to load certificate for Alternate Server 4:			
	Continue? $[y n]: y$ Please enter the co			
	MBEGA1UECBMKQ2FsaW	CATE IBADANBgkqhkiG9w0BAQQFADB8MQswCQYDVQQGEwJVUzET Zvcm5pYTESMBAGA1UEBxMJU2FuIERpZWdvMRkwFwYDVQQK N0ZW1zMRUwEwYDVQQLEwxTeXN0ZW0gR3JvdXAxEjAQBgNV		

```
-----END CERTIFICATE-----
CTRL-D
XSCF>
```

EXAMPLE 6 Configures user domain 2. <USERNAME> is a template that must be entered exactly as shown. During authentication the user's login name replaces <USERNAME>. userdomain can take the form of UPN or Distinguished Name (DN).

XSCF> setad userdomain -i 2 '<USERNAME>@yoshi.example.aCompany.com'

EXAMPLE 7 Loads a server certificate for Active Directory using the specified URI.

XSCF> setad loadcert http://domain_2/UID_2333/testcert

EXAMPLE 8 Loads a server certificate for Active Directory using an http Proxy Server with port 8080.

XSCF> setad loadcert -p webproxy.aCompany.com:8080 \
http://domain_2/UID_2333/testcert

EXAMPLE 9 Loads a server certificate for Active Directory using a username and password.

XSCF> setad loadcert -u yoshi \
http://domain_2/UID_2333/testcert

EXAMPLE 10 Removes the certificate for alternate server 3.

```
XSCF> setad rmcert -i 3
```

EXAMPLE 11 Sets logging of high-severity diagnostic messages.

XSCF> setad logdetail high

EXAMPLE 12 Clears diagnostic messages from the log file, answering Yes to all prompts. XSCF> **setad log -y clear**

EXAMPLE 13 Enables strictcertmode.

XSCF> setad strictcertmode enable

EXAMPLE 14 Configures the dnslocatorquery configuration. *service* represents the DNS query to be performed. The port ID is generally part of the record, but you can override it by using the format <PORT:*portnumber>*. Also, named services specific for the domain being authenticated can be specified by using the <DOMAIN> substitution marker.

XSCF> setad dnslocatorquery -i 2 \
'ldap.tcp.gc.msdcs.<DOMAIN>.<PORT:3269>'

setad(8)

	EXAMPLE 15 Configures the default privileges, where <i>privileges</i> are the same as those used in the setad group custom roles command. XSCF> setad defaultrole platadm platop		
EXIT STATUS	The following exit values are returned:		
	0	Successful completion.	
	>0	An error occurred.

NAME	setaltitude - Sets the altitude of the system.		
SYNOPSIS	setaltitude -s altitude= value		
	setaltitude -h		
DESCRIPTION	setaltitude is a con	mmand to set the altitude of the system.	
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-s altitude=value	Sets the altitude of the system. Specifies the altitude of the location where the system is installed by meter (m) in <i>value</i> . 0 or a larger integer can be specified by 100 m. Values less than 100 m are rounded up. The default value is 0 m.	
EXTENDED DESCRIPTION	• If the altitude of the system is set, abnormalities in the intake temperature can be detected early. If the altitude of the system is unknown, set a high altitude. If the altitude of the system is not set, temperature abnormalities can be detected by an abnormality of the CPU temperature, etc. Therefore, the system will not be damaged seriously.		
	 To reflect the set contents, it is necessary to reboot XSCF by using rebootxscf(8). Negative numbers are not supported in the altitude setting. If the altitude is below sea level, specify altitude=0. You can confirm the altitude of the system set currently by using showaltitude(8). 		
EXAMPLES	EXAMPLE 1 Set the altitude of the system to 1000 m. XSCF> setaltitude -s altitude=1000 1000m EXAMPLE 2 Set the altitude of the system to 200 m. The specified value is rounded up to the nearest 100 m. XSCF> setaltitude -s altitude=157 200m		

setaltitude(8)

EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	rebootxscf(8), showaltitude(8)		

NAME	setaudit - Manages the audit function of the system.		
SYNOPSIS	setaudit enable disable archive delete		
	<pre>setaudit [-p count suspend] [-m mailaddr] [-a users=enable disable default] [-c classes= {enable disable}] [-e events=enable disable] [-g {enable disable}] [-t percents]</pre>		
	setaudit -h		
DESCRIPTION	setaudit is a command to manage collection of data on the use of the system resources.		
	Audit data contains the record of the system event related to security. This data can be used for assignment of responsibilities to the actions executed in the system. In audit, the record is generated when the specified event occurs. The events which generate an audit record are below.		
	 Start and shutdown of the system 		
	Login and logout Action of eartherstication		
	Action of authenticationAction of administration		
D			
Privileges	To execute this command, auditadm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a users=enable disable default		
	Sets the audit record generation policy of the specified user. <i>users</i> is the comma-separated list of the valid user names.		
	If enable or disable is set, the audit record generation of the user becomes enable or disable, respectively. This setting disables the global policy of each specified user. To set the global policy of the user, use the -g option.		
	Setting this to default enables the global policy for the policy of the user. To confirm the global audit record policy of the user, use showaudit -g.		

```
-c classes=enable|disable
```

Changes the audit record generation policy of the specified audit class. *classes* is a comma-separated list of audit classes. Classes can be specified with a number or name. ACS_prefix can be omitted. For example, the classes of audit-related events can be expressed as ACS_AUDIT, AUDIT or 16.

The valid classes are below.

```
all
    All classes
ACS_SYSTEM(1)
    System-related event
ACS_WRITE(2)
    Command that can change the status
ACS_READ(4)
    Command to read the current status
ACS_LOGIN(8)
    Login-related event
ACS_AUDIT(16)
    Audit-related event
ACS_PPAR(32)
    Physical partition (PPAR) administration-related event
ACS_USER(64)
    User administration-related event
ACS PLATFORM(128)
    Platform administration-related event
ACS MODES(256)
    Mode-related event
You can specify more than one of these options. If more than one
of these options are specified, they are handled in the order of
the list with the -e option. See Example 1.
```

If enable or disable is set, the audit record generation of the specified class becomes enable or disable, respectively. It is possible to disable these settings for individual events by using the –e option. The audit record generation policies of classes and events are applied to all users. It is impossible to specify a unique policy of class or event for each individual user.

-e <i>events</i> =enable disable		
	Changes the audit record generation policy of the specified audit event. <i>events</i> is a comma-separated list of audit events. Events can be specified with a number or name. AEV_prefix can be omitted. For example, the event of SSH login can be expressed as AEV_LOGIN_SSH, LOGIN_SSH, or 0.	
	For the list of valid events, see showaudit -e all.	
	You can specify more than one of these options. If more than one of these options are specified, they are handled in the order of the list with the $-c$ option. See Example 3.	
	If enable or disable is set, the audit record generation of the specified event becomes enable or disable, respectively. Setting these options disables the settings of classes for events. The settings of classes are set by the -c option.	
	The audit record generation policies of classes and events are applied to all users. It is impossible to specify a unique policy of class or event for each individual user.	
-g enable dis	sable	
	Sets the global audit record generation policy of the user.	
	If it is set to disable, no audit record which can attribute to all user accounts is generated. These settings may be disabled depending on individual users by the -a option.	
-h		
	Displays the usage. Specifying this option with another option or operand causes an error.	
–m <i>mailaddr</i>		
	Sets the address of the e-mail sent when the usage of the local audit area reaches the threshold (See the -t option). The e-mail address needs to be an e-mail address in a valid format, "user@company.com." Specifying none in <i>mailaddr</i> disables e-mail notification.	

-p suspend cc	ount
	Sets the policy to be followed if the audit trail reaches the full capacity. The valid values are below.
	<pre>suspend Until free space is secured and it becomes possible to write on the record, or the policy is changed into count, all processes to write on the audit record are suspended. count New audit records are deleted. The number of the records to be deleted are counted.</pre>
	Note – If suspend is specified, degradation due to an error may occur or the XSCF may be rebooted. Specify the default value count as the write policy of the audit trail. Moreover, in XCP2250 or newer, specifying suspend will result in the same action as specifying count.
-t percents	
	Sets the threshold to issue a warning for the usage of the local region. <i>percents</i> is a comma-separated list showing the percentage of the used area. Up to four values can be set in this list. For example, if the values, 50, 75, 80, and 90 are set, a warning is issued when the usage of the ares available for audit records reaches 50%, 75%, 80%, and 90%, respectively. The default is 80%.
	A warning is issued as a message to the console. Optionally, it is also possible to issue a warning to the administrator by using e-mail. See -m <i>mailaddr</i> .

OPERANDS | The following operands are supported.

	archive	Notifies the archive mechanism of logs to archive the current audit trail.
		Note – Archiving of audit log files is not supported at this point.
	delete	Deletes the data of audit trail from the partition of audit logs in chronological order and uses the current partition. delete can be used to secure the area for new audit records when the local audit trail reaches the full capacity.
		Note – The space in a partition is automatically cleared when logs are archived, if necessary. Operations are required only if a problem with the audit policy or network interrupts archiving of audit logs.
		Note – If setaudit delete is executed twice, data is also deleted from the new audit log partition and no data of audit trail is kept.
		Note – Archiving of audit log files is not supported at this point.
		For details on administration of audit logs, see the <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide</i> .
	disable	Disables writing audit records on audit trail. After that, it notifies the archive mechanism of logs to archive the current audit trail.
		Note – Archiving of audit log files is not supported at this point.
	enable	Enables writing audit records on audit trail.
EXTENDED DESCRIPTION	It is possible to c showaudit(8).	confirm the contents of the audit system set currently by using
EXAMPLES		ge the class by name. Disable the login- and audit-related audit classes enable the lead-related audit classes.
	XSCF> setaud :	it -c LOGIN,AUDIT=disable -c ACS_READ=enable
		nge the class by number. Disable the classes 8 (login) and 16 (audit) and le 1 (system).
	XSCF> setaud :	it -c 8,16=disable -c 1=enable

setaudit(8)

	EXAMPLE 3	Change the class and enable the event. Disable the event 64 (user) only and enable the class 1 (system).	
	XSCF> setaudit -c 1=enable -e 64=disable		
	EXAMPLE 4	Enable audit. Enable writing on records for audit trail.	
	XSCF> SC	etaudit enable	
	EXAMPLE 5	Enable warning. If the capacity reaches 50% or 75%, a warning is sent.	
	XSCF> SC	etaudit -t 50,75	
EXIT STATUS	The follow	ving exit values are returned.	
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	showaudi	t (8)	

NAME	setautologout - Sets the session timeout time of XSCF shell.		
SYNOPSIS	setautologout -s timeout		
	setautologout -h	1	
DESCRIPTION	setautologout	is a command to set the session timeout time of XSCF shell.	
	The default time	out time is 10 minutes.	
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-s timeout	Specifies the session timeout time of XSCF shell. Specify the time to timeout in <i>timeout</i> by minutes. You can specify an integer from 1 to 255.	
EXTENDED DESCRIPTION	 The set session timeout time becomes valid from the next login. You can confirm the session timeout time of XSCF shell set currently by using showautologout(8). 		
EXAMPLES	EXAMPLE 1 Set th	e session timeout time of XSCF shell to 30 minutes.	
	XSCF> setauto 30min	blogout -s 30	
EXIT STATUS	The following ex	it values are returned.	
	0	Indicates normal end.	
	>0	Indicates error occurrence.	
SEE ALSO	showautologout	(8)	

setautologout(8)

NAME	setcod - Sets up the CPU core resources to be used in physical partitions (PPAR).
SYNOPSIS	setcod [-p ppar_id] -s cpu
	<pre>setcod [[-q] -{y n}] -p ppar_id -s cpu -c {set add del} permits</pre>
	setcod -p ppar_id -s cpu permits
	setcod -h
DESCRIPTION	setcod is the command to set up the CPU core resources to be used in physical partitions (PPAR). To set CPU core resources to be used in PPARs, the number of CPU Activations is to be specified.
	If setcod is executed without specifying the <i>permits</i> operand, the number of CPU Activations for each PPAR can be specified interactively. The prompt to enter the number of the CPU Activations shows the possible maximum value of the number in round brackets and the number currently set in square brackets ([]). If the number of the keys is not specified, the current value is retained.
	Moreover, if the -p <i>ppar_id</i> option was not specified, a prompt is displayed where the number of CPU Activations for each PPAR can be input.
	Note – When specifying the number of CPU Activations using $-c \text{ set}$, specify the final number after addition to or removal from the present number, but not the number that is to be added or removed, to the operand <i>permits</i> . If the number to be added or removed is specified, the system may come to a halt, due to overdecrement of the number of CPU Activations. It will be the same even if the $-c$ option is omitted.
	Before executing this command, it is necessary to add the CPU Activation key to the SPARC M12/M10 systems using addcodactivation(8).
Privileges	To execute this command, platadm privilege is required.
	For details on user privileges, see setprivileges(8).
I	

setcod(8)

OPTIONS	The following options are supported.	
	-c set	Sets up CPU core resources to PPAR.
		The number of CPU Activations that is to be allocated to a PPAR is specified to the operand <i>permits</i> .
	-c add	Adds CPU core resources to PPAR.
		The number of CPU Activations that is to be added to a PPAR is specified to the operand <i>permits</i> .
	-c del	Removes CPU core resources from PPAR.
		The number of CPU Activations that is to be removed from a PPAR is specified to the operand <i>permits</i> .
	-р ppar_id	Specifies the PPAR-ID that is to be configured. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
	-s cpu	Sets up CPU core resources to PPAR.
		Specify the number of CPU Activations to be set to PPAR in the operand <i>permits</i> . If setcod is executed without specifying the <i>permits</i> operand, the number of CPU Activations for each PPAR can be specified interactively.
	-đ	Prevents display of messages, including prompt, for standard output.
	-у	Automatically responds to prompt with "y" (yes).
	-n	Automatically responds to prompt with "n" (no).
	-h	Displays the usage. Specifying this option with another option or operand causes an error.

OPERANDS | The following operand is supported.

permits	-	number of the CPU Activations allocated for PPAR. CPU an be allocated in units of 1 core.	
	The meaning of the numerical value, specified by <i>permits</i> changes like the following, in accordance with the parameter {set add del} specified by the -c option.		
		the number of CPU Activations, specified by <i>permits</i> in unning PPAR is inadequate, the system may come to a	
	-c set	Specifies the number of CPU Activations that is to be allocated to a PPAR. It is not possible to allocate more CPU Activations than what is available. The number of available CPU Activations can be obtained by showcod(8).	
	-c add	Specifies the number of CPU Activations that is to be added to a PPAR. It is not possible to add more CPU Activations than what is available. The number of CPU Activations that can be added and the number of CPU Activations that have already been allocated to the PPAR, can be obtained by showcod(8).	
		Note – The number of CPU Activations that can be added is the installed CPU Activations that have not being allocated to any PPAR.	
	-c del	Specifies the number of CPU Activations that is to be removed from a PPAR. It is not possible to remove more CPU Activations than what is being allocated to a PPAR. The number of CPU Activations that is currently allocated to a PPAR can be obtained by showcod(8).	
	the same as w omitted, setc	-c option is omitted, the value of <i>permit</i> will be rendered when -c set is specified. However, if the -c option is cod will function like the following. Therefore, it is d to use the -c option.	
	-	erforming configuration change, the system will not ask irmation from the user.	
	 When repPAR, the case, if the permits, set in the permits of th	educing the number of CPU Activations from a running he system will not output warning messages. In such a he number of CPU Activations to reduce, as specified by is equal to or more than what is allocated to it, the system ruptly come to a halt.	

```
EXTENDED
                  The following specification will be integrated in -c set and thus, may not be
DESCRIPTION
                  supported in the future.
                  setcod -p ppar_id -s cpu permits
   EXAMPLES
                  EXAMPLE 1 Set up the number of CPU Activations that is to be allocated to PPAR-ID 0 to
                             30.
                    XSCF> setcod -p 0 -s cpu -c set 30
                    PROC Permits assigned for PPAR 0 : 0 -> 30
                    PROC Permits assigned for PPAR will be changed.
                    Continue? [y|n] :y
                    Completed.
                  EXAMPLE 2 Change the number of CPU Activations that is allocated to PPAR-ID 0 from
                             32 to 30. While a PPAR is running, if the specified number is less than that of
                             the allocated number of CPU Activations, a warning message is output.
                    XSCF> setcod -p 0 -s cpu -c set 30
                    PROC Permits assigned for PPAR 0 : 32 -> 30
                    Note:
                      There is a possibility that logical domains are stopped
                      for CoD resource violation.
                    PROC Permits assigned for PPAR will be changed.
                    Continue? [y|n] :y
                    Completed.
                  EXAMPLE 3 Add 2 CPU Activations to PPAR-ID 0.
                    XSCF> setcod -p 0 -s cpu -c add 2
                    PROC Permits assigned for PPAR 0 :
                                                           30 -> 32
                    PROC Permits assigned for PPAR will be changed.
                    Continue? [y|n] :y
                    Completed.
                  EXAMPLE 4 Remove 2 CPU Activations from PPAR-ID 0.
                    XSCF> setcod -p 0 -s cpu -c del 2
                    PROC Permits assigned for PPAR 0 :
                                                          30 -> 28
                    PROC Permits assigned for PPAR will be changed.
                    Continue? [y|n] :y
                    Completed.
```

EXAMPLE 5 Remove 2 CPU Activations from PPAR-ID 0. If the PPAR is running when this action is performed, a warning message is output.

```
XSCF> setcod -p 0 -s cpu -c del 2
PROC Permits assigned for PPAR 0 : 30 -> 28
Note:
There is a possibility that logical domains are stopped
for CoD resource violation.
PROC Permits assigned for PPAR will be changed.
Continue? [y|n] :y
Completed.
```

EXAMPLE 6 Set the number of CPU Activations that is to be allocated to a PPAR. If the number of specified CPU Activations is less than what is already allocated to PPARs and if any of those PPARs is in a running state, a warning message is output.

```
XSCF> setcod -s cpu
PROC Permits installed: 10 cores
PROC Permits assigned for PPAR 0 (10 MAX) [Permanent 2cores]
Permanent [2]:4
PROC Permits assigned for PPAR 1 (6 MAX) [Permanent 4cores]

NAME	setdate - Sets the	date and time of the XSCF clo	ck.
SYNOPSIS	setdate [[-q] - {y n}] [-u] -s <i>date</i>		
	setdate -h		
DESCRIPTION	setdate is a con	nmand to set the date and time	e of the XSCF clock.
		s specified without specifying t after converted to the coordin	the -u option when setting the date ated universal time (UTC).
	After the comma	nd is executed, XSCF is autom	atically rebooted.
Privileges	To execute this c	ommand, platadm or fielder	ng privilege is required.
	For details on us	er privileges, see setprivile	ges(8).
OPTIONS	The following op	otions are supported.	
	-h	Displays the usage. Specifyin or operand causes an error.	g this option with another option
	-n	Automatically responds to pr	rompt with "n" (no).
	-d	Prevents display of messages output.	s, including prompt, for standard
	-s date	Sets the date and time. <i>date</i> can be specified in either of the following formats.	
		yyyy.MM.DD-hh:mm:ss	"Year.Month.DateHour (24 hour format):minute:second"
		MMDDhhmmyyyy.ss	"Month Date Hour (24 hour format) Minute Year.Second"
	-u	Specifies the time and date ir applicable.	n UTC. If omitted, the local time is
	-у	Automatically responds to pr	rompt with "y" (yes).
EXTENDED DESCRIPTION	the specified cthe [n] key.Setting the time	contents is displayed. To execut	confirm whether to execute it with re, press the [y] key. To cancel, press difference from the Hypervisor time
	 of each physical partition (PPAR) and cause a mismatch of the time when PPAR is started. After setting the time, confirm the difference between XSCF and the Hypervisor time of each PPAR by using showdateoffset(8). If the difference becomes large, reset the difference of the time by resetdateoffset(8). Execution of setdate, while the XSCF NTP client feature is enabled, causes an 		
	error. Howeve	er, only in the case where the ti	me has reverted back to the initial be restored to the right value using

setdate(8)

	setdate even if XSCF NTP client feature is enabled. The status of the NTP client feature can be checked by showntp(8).
	• You can confirm the date and time of XSCF set currently by using showdate(8).
EXAMPLES	EXAMPLE 1 Specify "October 20, 2012 16:59:00" in JST and set it after converting it into UTC. After the setting is made, XSCF is rebooted.
	<pre>XSCF> setdate -s 102016592012.00 Sat Oct 20 16:59:00 JST 2012 The XSCF will be reset. Continue? [y n] :y Sat Oct 20 7:59:00 UTC 2012 XSCF> (After this, the reset processing continues.)</pre>
	EXAMPLE 2 Set the current time to "October 20, 2012 07:59:00" in UTC. After the setting is made, XSCF is rebooted.
	XSCF> setdate -u -s 102007592012.00
	Sat Oct 20 07:59:00 UTC 2012 The XSCF will be reset. Continue? $[y n] : \mathbf{Y}$
	Sat Oct 20 7:59:00 UTC 2012 XSCF>
	(After this, the reset processing continues.)
	EXAMPLE 3 Set the current time to "October 20, 2012 16:59:00" in JST. The prompt is automatically given a "y" response. After the setting is made, XSCF is rebooted.
	XSCF> setdate -y -s 102016592012.00
	Sat Oct 20 16:59:00 JST 2012 The XSCF will be reset. Continue? [y n] :y
	Sat Oct 20 7:59:00 UTC 2012 XSCF>
	(After this, the reset processing continues.)
	EXAMPLE 4 Set the current time to "October 20, 2012 16:59:00" in JST. The prompt is automatically given a "y" response after hiding the message. After the setting is made, XSCF is rebooted.
	XSCF> setdate -q -y -s 102016592012.00
	XSCF> (After this, the reset processing continues.)
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>setntp(8), settimezone(8), showdate(8), showntp(8), showtimezone(8)</pre>

NAME	setdomainconfig - Specifies the logical domain configuration when the physical partition (PPAR) is started.			
SYNOPSIS	setdomainconfig -p ppar_id			
	setdomainconfig	;[[-q]-	{y n}] -p ppar_id -i index	
	setdomainconfig	; [[-q] -	{y n}] -p <i>ppar_id</i> -c default	
	setdomainconfig	; -h		
DESCRIPTION	setdomainconf the PPAR is start		ommand to specify the logical domain configuration when time.	
	If setdomainconfig is executed without specifying -i <i>index</i> , the list of the logical domain configurations is displayed on the prompt and then specify the Index of the logical domain configuration used when PPAR is started next time. If Index is not specified, the current setting is retained.			
Privileges	To execute this co	ommand	, any of the following privileges is required.	
	platadm, field	leng	Enables execution for all PPARs.	
	pparadm		Enables execution for PPARs for which you have administration privilege.	
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-c default	Sets the logical domain configuration to the factory setting (factory-default).		
	-h	Displays the usage. Specifying this option with another optio or operand causes an error.		
	−i index	Specifies the administration number specified for the logical domain configuration. The administration number can be confirmed by showdomainconfig(8). You can specify an integer from 1 to 8.		
	-n	Autom	atically responds to prompt with "n" (no).	
	-p ppar_id		es the PPAR-ID to set the logical domain configuration. can be 0-15 depending on the system configuration.	
	-d	Preven output	ts display of messages, including prompt, for standard	
	-у	Autom	atically responds to prompt with "y" (yes).	

EXTENDED The logical domain configuration is saved by Logical Domains (LDoms) DESCRIPTION Manager. When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. • You can confirm the contents of the logical domain configuration set currently by using showdomainconfig(8). • In case of a logical domain with a configuration other than that of "factory default", if the configuration is changed to "factory-default", using the -c default or the -i *index* option of this command or by using any setup of Oracle VM Server for SPARC, when the related PPAR is booted the next time, the OpenBoot PROM environment variables are initialized. Meanwhile, if the configuration of the logical domain is "factory default", executing any of the aforesaid procedures will not result in the initialization of the OpenBoot PROM environment variables. **EXAMPLES EXAMPLE 1** Set the logical domain configuration of PPAR-ID 0 to "ldm-set1." XSCF> setdomainconfig -p 0 PPAR-ID :0 Booting config (Current) :1dm-set2 (Next) :ldm-set2 _____ ____ Index :1 config_name :factory-default domains :1 date_created:-_____ ____ Index :2 config_name :ldm-set1 domains :8 date_created: '2012-08-08 11:34:56' _____ ____ Index :3 config_name :ldm-set2 domains :20 date_created: '2012-08-09 12:43:56' _____ Select Index of Using config_name :2 PPAR-ID of PPARs that will be affected :00 Logical domain config_name will be set to "ldm-set1". Continue? [y|n] :y

	EXAMPLE 2 Set the logical domain configuration of PPAR-ID 0 to "ldm-set2."				
	XSCF> setdomainconfig -p 0 -i 1 Index :1 config_name :1dm-set2 domains :8 date_created:'2012-08-08 11:34:56'				
	PPAR-ID of PPARs that will be affected:00 Logical domain config_name will be set to "ldm-set2". Continue? [y n] : Y				
	EXAMPLE 3 Set the logical domain configuration of PPAR-ID 0 to the default. The prompt is automatically given a "y" response.				
	XSCF> setdomainconfig -y -p 0 -c default PPAR-ID of PPARs that will be affected :00 Logical domain config_name will be set to "factory-default". Continue? [y n] :y				
EXIT STATUS	The following exit values are returned.				
	0 Indicates normal end.				
	>0 Indicates error occurrence.				
SEE ALSO	showdomainconfig(8)				

setdomainconfig(8)

NAME	setdualpowerfeed - Sets the dual power feed mode.				
SYNOPSIS	setdualpowerfeed [-a -b bb_id] -s key				
	setdualpowerfe	ed -h			
DESCRIPTION	setdualpower system.	feed is to enable	or disable the dual power feed mode of the		
	Note – The SPARC M10 system and the SPARC M12-1 each have two mounted power supply units. Even when the dual power feed function is set to enabled/disabled, the setting will not make any changes to the system behavior in the redundant configuration. The function for setting dual power feed is used as a "memo" for the system administrator to check the current status. The SPARC M12-2/M12-2S has four mounted power supply units. In cases of dual power feed, each power feed system consists of two power supply units. For details, see the <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide</i> .				
Privileges	To execute this command, platadm or fieldeng privilege is required.				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-a		dual power feed mode of all SPARC M12/M10 and the crossbar boxes.		
	-ъ bb_id	Specifies the BB-ID to which you set the dual power feed mode. In <i>bb_id</i> , you can specify an integer from 0 to 15 in case of SPARC M12/M10 systems, and from 80 to 83 in case of crossbar box.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	-s key	Sets the dual power feed mode of the system. You can specify either of the following for <i>key</i> .			
		enable disable	Enables the dual power feed mode. Disables the dual power feed mode.		
EXTENDED DESCRIPTION	 You can confi showdualpo 		he dual power feed mode set currently by using		
	 You can confirm the information of the model and power supply unit (PSU) set currently by using showhardconf(8). 				
	 The dual pow 	ver feed setting is	applied soon after setdualpowerfeed o reboot the XSCF.		

EXAMPLES | **EXAMPLE 1** Disables the dual power feed mode of the entire system.

```
XSCF> setdualpowerfeed -a -s disable
BB#00:enable -> disable
BB#01:enable -> disable
BB#02:enable -> disable
BB#03:enable -> disable
BB#04:enable -> disable
BB#05:enable -> disable
BB#06:enable -> disable
BB#07:enable -> disable
BB#08:enable -> disable
BB#09:enable -> disable
BB#10:enable -> disable
BB#11:enable -> disable
BB#12:enable -> disable
BB#13:enable -> disable
BB#14:enable -> disable
BB#15:enable -> disable
XBBOX#80:enable -> disable
XBBOX#81:enable -> disable
XBBOX#82:enable -> disable
XBBOX#83:enable -> disable
```

EXAMPLE 2 Enables the dual power feed mode of BB-ID 01.

```
XSCF> setdualpowerfeed -b 1 -s enable
BB#00:disable -> disable
BB#01:disable -> enable
BB#02:disable -> disable
BB#03:disable -> disable
BB#04:disable -> disable
BB#05:disable -> disable
BB#06:disable -> disable
BB#07:disable -> disable
BB#08:disable -> disable
BB#09:disable -> disable
BB#10:disable -> disable
BB#11:disable -> disable
BB#12:disable -> disable
BB#13:disable -> disable
BB#14:disable -> disable
BB#15:disable -> disable
XBBOX#80:disable -> disable
```

setdualpowerfeed(8)

	XBBOX#81:disable -> disable XBBOX#82:disable -> disable XBBOX#83:disable -> disable
	EXAMPLE 3 Enables the dual power feed mode on the SPARC M10-1. XSCF> setdualpowerfeed -b 0 -s enable BB#00:disable -> enable
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	showdualpowerfeed (8), showhardconf(8)

setdualpowerfeed(8)

NAME	setemailreport - S	Sets the e-mail report function.		
SYNOPSIS	setemailreport [-v] [-t]			
	setemailreport [-s variable= value]			
	setemailreport -1	h		
DESCRIPTION	setemailrepor maintenance.	t is a command to set the e-mail report function for remote		
		vely set the e-mail report function by executing setemailreport of an option. For interactive setting, use the following options.		
	-a	Addition of addressee		
	-d	Deletion of addressee		
	-r	Replacement of addressee (Default)		
	To set the e-mail	report non-interactively, specify the -s option.		
	Setting the mail s by setemailrep	erver and port using setsmtp(8) enables transmission of test mail		
Privileges	To execute this command, platadm privilege is required.			
	For details on use	er privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		

	-s variable=value	Sets the e-mail report function.			
		You can specify the following values for variable.			
		enable	Specifies whether to enable the e-mail report function.		
		recipient	Specifies the recipient address of e-mail.		
		If enable is set in <i>variable</i> , you can specify either of the following values for <i>value</i> .			
		yes no	Enables the e-mail report function. Disables the e-mail report function.		
		If recipient is set in <i>variable</i> , specify the recipient e-mail address for <i>value</i> . The e-mail addresses can be specified by separating them either with commas (,), colons (:), or semicolons (;). If multiple addresses are specified, enclose them in double quotation marks (").			
	-t	Sends a test mail.			
	-V	Displays detailed message.			
EXTENDED DESCRIPTION	 showemailrepe The e-mail address following format The local-part this format: local characters, the sharacters, the sharacters is the sharacters in the sharacters in the sharacters is the sharacters in the sharacters is the sharacters in the sharacters is the sharacters is the sharacters in the sharacters is the sharacters in the sharacters is the sharacters is	ort(8). esses that are used w t, which is based on t and the domain sh ocal-part@domain, th e domain should no	ail report set currently by using with the setemailreport should be in the "3.4.1. Addr-Spec Specification" of RFC5322. ould be combined by the "@" character in he local-part should not contain more than 64 of contain more than 255 characters and the not contain more than 256 characters		
			an be used in the local-part:		
	-	mnopqrstuvwxyz	-		
	- ABCDEFGH	IIJKLMNOPQRSTU	VWXYZ		
	- 0123456789				
	- !#\$%&'*+-/=				
			first or last character of the local-part. aracter cannot be used consecutively.		
		hould be specified a ot (.), in this format	as a combination of its constituent labels, a label1.label2.		
			first or last character of the domain part. aracter cannot be used consecutively.		
	• The labels, w	hich are part of dom	nains, may contain the following characters:		

	- abcdefghijklmnopqrstuvwxyz - ABCDEFGHIJKLMNOPQRSTUVWXYZ - 0123456789
	 The hyphen (-) cannot be used as the first character of a label. If there are more than one recipients, put all the e-mail addresses in a pair of double quotes and separate individual e-mail addresses either with commas (,), colons (:), or semicolons (;).
	Note – Depending on the mail server, the above symbols may not be used.
	 Note – The following formats as defined in RFC5322 are not supported: 3.2.1. quoted-pairs, as defined in "Quoted Characters". 3.2.2. CFWS, FWS, comment, as defined in "Folding White Space and Comments". 3.2.4. quoted-strings, as defined in "Quoted Strings". 3.4.1. domain-literal, as defined in "Addr-Spec Specification". 4. The obsolete formats described in "Obsolete Syntax".
EXAMPLES	EXAMPLE 1 Enable the e-mail report function interactively.
	<pre>XSCF> setemailreport Enable E-Mail Reporting? [no]:yes E-mail Recipient Address [useradm@company.com]: Do you want to send a test mail now [no]? yes Sending test mail to 'useradm@company.com'</pre>
	EXAMPLE 2 Add the e-mail address to receive the e-mail report interactively.
	XSCF> setemailreport Enable E-Mail Reporting? [yes]: [Enter] E-mail Recipient Address [useradm@company.com]: -a adm2@company.com
	EXAMPLE 3 Delete the e-mail address to receive the e-mail report interactively.
	XSCF> setemailreport Enable E-Mail Reporting? [yes]: [Enter] E-mail Recipient Address [adm2@company.com]: -d adm2@company.com
	EXAMPLE 4 Set the e-mail report function non-interactively.
	XSCF> setemailreport -s enable=yes -s recipient="useradm@company.com,adm2@company.com"
	EXAMPLE 5 Send a test mail.
	XSCF> setemailreport -t Sending test mail to 'useradm@company.com'

setemailreport(8)

EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	setsmtp(8), show	wemailreport(8)

NAME	sethostname - Sets the host names and DNS domain names of the master chassis and chassis whose XSCF is standby.		
SYNOPSIS	sethostname xscj	fu hostname	
	sethostname -d	domainname	
	sethostname -h		
DESCRIPTION		a command to set the host names and DNS domain names of the nd chassis whose XSCF is standby.	
Privileges	To execute this co	ommand, platadm privilege is required.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-d <i>domainname</i> -h	Specifies the DNS domain names to be set for the master chassis/chassis whose XSCF is standby. <i>domainname</i> is specified with the label elements separated by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) It shall be specified keeping the number of characters including that of <i>hostname</i> 253 or lower. The reason why the number of characters is 253 or lower is that two characters are kept for one period to connect <i>hostname</i> with <i>domainname</i> and another one to indicate the root domain. Displays the usage. Specifying this option with another option or operand causes an error.	

OPERANDS	l	The following operands are supported.

	hostname	Specifies the host names to be set for the master chassis and chassis whose XSCF is standby. Specifies it not by the Fully Qualified Domain Name (FQDN) but within 63 characters in the abbreviated format. It shall be specified keeping the number of characters including that of <i>domainname</i> 253 or lower. The reason why the number of characters is 253 or lower is that two characters are kept for one period to connect <i>hostname</i> with <i>domainname</i> and another one to indicate the root domain. <i>hostname</i> is specified with the label elements separated by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) Specifies the chassis to be set. Depending on the system configuration, you can specify it as follows. Omitting this causes an error.		
	xscfu			
		■ For SPARC M12	2-2S/M10-4S (with crossbar box)	
		XBBOX#80 XBBOX#81	xbbox#80 xbbox#81	
		■ For SPARC M12	2-2S/M10-4S (without crossbar box)	
		BB#00 BB#01	bb#00 bb#01	
		■ For SPARC M12	2-1/M12-2/M10-1/M10-4	
		bb#00		
EXTENDED DESCRIPTION	 The following cases cause an error when applynetwork(8) is executed Case that the host name and DNS domain name are not set Case that the character strings "localdomain" and "localhost" ar specified for the DNS domain name and host name, respectively. Case that the total number of characters including the DNS domain 			
	 by sethost To reflect the sapplynetwor contents of set 	tname and search paset host name and Detection (8). After that, rebetting.	ath set by setnameserver(8) exceeds 256. PNS domain name in XSCF, execute oot XSCF by rebootxscf(8) and fix the ad DNS domain name set currently by using	

I

EXAMPLES	EXAMPLE 1 Set the host name, scf0-hostname, in BB#00.			
	XSCF> sethostname bb#00 scf0-hostname			
	EXAMPLE 2 Specify the DNS domain name, example.com, the master chassis/chassis whose XSCF is standby.			
	XSCF> sethostname -d example.com			
EXIT STATUS	The following exit values are returned.			
	0 Indicates normal end.			
	>0 Indicates error occurrence.

sethostname(8)

NAME	sethsmode - Enables/Disables the high speed mode of the CPU.	
SYNOPSIS	sethsmode [[-q] -{y n}] -s {on off}	
	sethsmode -h	
DESCRIPTION	Enabling (setting	command to enable or disable the high speed mode of the CPU. g "on") the high speed mode increases the CPU frequency GHz) as the number of fan speed increases and the cooling proved.
	The default setting is disabled (off).	
	Executing sethsmode reboots the XSCF, and the setting information is reflected at the system power-on time.	
	This command is not supported on SPARC M12-1/M12-2/M10-1/M10-4/M10-4S.	
	Note – When the high speed mode is enabled, noise becomes larger compared with the case where the mode is disabled. Enabling the mode does not guarantee the maximum value of 4.35 GHz of the CPU frequency.	
Privileges	To execute this command, any of the following privileges is required.	
	platadm, fieldeng For details on user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-n	Automatically responds to prompt with "n" (no).
	-d	Prevents display of messages, including prompts, for standard output.
	-s {on off}	Enables high speed mode with "on" or disables high speed mode with "off".
	-У	Automatically responds to prompt with "y" (yes).
EXTENDED DESCRIPTION		option is specified, sethsmode terminates abnormally. Ismode while the system is shut down. If the system is not shut es an error.

	The system shutdown status means the status in which all PPARs are shut dow If it is in operation, all PPARs are shut down by executing poweroff -a and then the power of the system is turned off. You can check the system power status by executing showhardconf(8) and referring to the "System_Power:" display ("On" or "Off").		
	 showhsmode(8) can check whether sethsmode has enabled or disabled high speed mode. 		
	 After executing sethsmode, the XSCF is rebooted. 		
	 Since the XSCF is rebooted, the high speed mode of the CPU cannot be set when any of the following commands is being executed: 		
	<pre>diagxbu(8), flashupdate(8), poweron(8), rebootxscf(8), restoreconfig(8), setdate(8), testsb(8)</pre>		
EXAMPLES	EXAMPLE 1 Enable (set "on") the high speed mode of the CPU.		
	XSCF> sethsmode -s on The specified modes will be changed. The XSCF will be reset. Continue? $[y n] : \mathbf{Y}$		
	EXAMPLE 2 The command is executed when the power to the system is on.		
	XSCF> sethsmode -s off The specified modes will be changed. The XSCF will be reset. Continue? $[y n] : \mathbf{y}$ Cannot perform this operation while the PPAR is powered on.		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	showhsmode(8)		

NAME	sethttps - Sets the start and halt of the HTTPS service used in the XSCF network. Also it performs authentication-related settings.
SYNOPSIS	sethttps [[-q] -{y n}] -c {enable disable}
	sethttps -c gencsr country state province locality organization organizationalunit common e-mail
	sethttps [[-q] -{y n}] -c genserverkey
	sethttps -c importca
	$\begin{array}{l} \textbf{sethttps} \left[\left[-q \right] - \left\{ y \middle n \right\} \right] - c \ \texttt{selfsign} \ country \ state \ \middle \ province \ locality \ organization \\ organizationalunit \ common \ e-mail \end{array} $
	sethttps –h
DESCRIPTION	sethttps is a command to set the start and halt of the HTTPS service used in the XSCF network. It also performs authentication-related settings used in the HTTPS service.
	The following contents can be set as authentication-related items.
	 Self-certificate-related settings
	 Construction of self-certificate authority
	 Generation of private keys of Web servers
	 Creation of self-signed Web server certificates
	 External certificate-related settings
	 Generation of private keys of Web servers
	 Generation of certificate signing requests (CSR) for Web servers and requests for issuance of certificates
	 Import of Web server certificates
	In multi-XSCF configuration, the settings are automatically reflected in the standby XSCF.
Privileges	To execute this command, platadm privilege is required.
	For details on user privileges, see setprivileges(8).

sethttps(8)

OPTIONS	The following options are supported.			
	-c {enable disable}		Specifies the start and half of the HTTPS service. You can specify either of the following. Omitting this causes an error.	
			enable disable	Starts HTTPS service. Halts HTTPS service.
			certificate when sta server private key	server private key or Web server arting HTTPS service, creates a Web and self-signed Web server certificate f-certificate authority and starts HTTPS
				ce is started, the settings are reflected accution is completed and the service is
	-c gencsr		Generates CSR.	
	-c genserverke	У	Creates private key for Web server.	
	-c importca		Imports the Web se authority to XSCF.	erver certificate signed at the certificate
	-c selfsign		Constructs a self-co signed Web server	ertificate authority. It also creates a self- certificate.
	-h		Displays the usage option or operand	e. Specifying this option with another causes an error.
	-n		Automatically resp	oonds to prompt with "n" (no).
	-d		Prevents display of standard output.	f messages, including prompt, for
	-У		Automatically resp	oonds to prompt with "y" (yes).
OPERANDS	The following operands are supported.			
	common	name self	e of servers within ϵ	the such as the creator name and host 54 characters. When specifying $-c$ pecify values containing only space
	country	When		e with two characters such as JP and US. lfsign, you cannot specify values aaracters.
	e-mail	Speci	fies the e-mail add	ress within 64 characters.

	locality	Specifies the name of a city, etc. within 64 characters.		
	organization	Specifies the name of a company, etc. within 64 characters. When specifying -c selfsign, you cannot specify values containing only space characters.		
	organizationalunit	Specifies the names of a division and department, etc. within 64 characters.		
	state province	Specifies the names of a state and prefecture, etc. within 64 characters. When specifying -c selfsign, you cannot specify values containing only space characters.		
	Format rules of o	perands:		
	 If any symbols or space characters are included in the value, specify the entire value enclosing it in single quotation marks (') or double quotation marks (") like "Kawasaki city." 			
	 To specify space characters only, specify the space characters e single quotation marks (') or double quotation marks (") like " are operands for which values composed of space characters o specified. For details, see the explanation of each operand. 			
	■ To create CSR,	you cannot specify space characters for any operands.		
	quotation marl	nds, specify two continuous single quotation marks (') or double ks (") like "". At this time, a Web server certificate is generated contents set initially.		
	 To include a bab before it like " 	ackslash (\) or dollar mark (\$), specify it with a backslash (\) just $\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$		
	 As for -c sel: See the format 	Esign or -c gencsr, the specification order of operands is fixed.		
EXTENDED DESCRIPTION		cute the command, a prompt to confirm whether to execute it with ontents is displayed. To execute, press the [y] key. To cancel, press		
	 CSR is created 	by overwriting.		
		TPS service, the contents of settings are reflected just after ethttps, and the service is started.		
	HTTPS service	Veb server private key or Web server certificate when starting , creates a Web server private key and self-signed Web server creating a self-certificate authority and starts HTTPS service.		
		service is reflected just after execution of sethttps. At this time, sions in operation are disconnected, if any.		

sethttps(8)

 Creation of Web server private keys, (-c genserverkey), import of server certificates (-c importca), construction of self-certificate authority, and creation of self-signed Web server certificates (-c selfsign) can be executed only when HTTPS service is halted. • You can confirm the contents of the HTTPS service set currently by using showhttps(8). EXAMPLES **EXAMPLE 1** Start HTTPS service. XSCF> sethttps -c enable Continue? [y|n] :y **EXAMPLE 2** Halt HTTPS service. XSCF> sethttps -c disable Continue? [y|n] :y If there is no Web server certificate when executing enable, create a self-cer-EXAMPLE 3 tificate authority and self-signed Web server certificate, and start HTTPS service. XSCF> sethttps -c enable The Web serverkey or Web server certificate which has been signed by an external certification authority does not exist. Create self certification authority and Web server certificate which has been self signed. Continue? [y|n] :y **EXAMPLE 4** Generate a Web server certificate signing request (CSR) based on the following contents. country: JP, state | province: Kanagawa, locality: Kawasaki, organization: Example, organizationalunit: development, common: scf-host, e-mail: abc@example.com XSCF> sethttps -c gencsr JP Kanagawa Kawasaki Example development \ scf-host abc@example.com **EXAMPLE 5** Construct a self-certificate authority based on the following contents and generate a self-signed Web server certificate. *country*: IP, *state* | *province*: Kanagawa, locality: Kawasaki, organization: Example, organizationalunit: development, common: scf-host, e-mail: abc@example.com XSCF> sethttps -c selfsign JP Kanagawa Kawasaki Example development scf-host abc@example.com CA key and CA cert already exist. Do you still wish to update? [y|n] :**y** Enter passphrase: Verifying - Enter passphrase:

EXAMPLE 6 Create private key for Web server.

```
XSCF> sethttps -c genserverkey
Server key already exists. Do you still wish to update? [y|n] :y
Enter passphrase:
Verifying - Enter passphrase:
```

EXAMPLE 7 Import the copied Web server certificate. To terminate it, press the [Enter] key and then press the [Ctrl]+[D] key.

```
XSCF> sethttps -c importca
```

Please import a certificate:

l

NAME	setinterimpermit - Enables/Disables CPU Activation Interim Permit.
SYNOPSIS	<pre>setinterimpermit [[-q] -{y n}] -p ppar_id -c {enable disable}</pre>
	setinterimpermit -h
DESCRIPTION	setinterimpermit is a command that enables/disables CPU Activation Interim Permit (hereafter "Interim Permit") for each physical partition (PPAR). On SPARC M12-1/M12-2/M10-1/M10-4 systems, "each PPAR" means the entire system.
	Interim Permit is a function that permits the use of all CPU core resources physically present in a physical partition (PPAR) for a limited period of 30 calendar days. Interim Permit can be used when the quantity of activated CPU cores in the PPAR is not sufficient and more CPU core resources are required immediately. Interim Permit is a useful method to respond quickly to sudden workload expansion and can be used to provide CPU core resources while the order/delivery process for purchased CPU Activation permits in progress.
	On SPARC M12-2S/M10-4S systems, Interim Permit can be enabled/disabled only for PPARs to which logical system boards (LSBs) have been assigned by setpcl(8).
	When Interim Permit is enabled, CPU Activations for all CPU core resources on LSBs assigned to the specified PPAR are temporarily assigned to the PPAR. This enables the use of additional CPU core resources within the effective period (30 calendar days) and until purchased CPU Activation keys are received and registered in the system.
	Use Interim Permit when the system does not have enough CPU Activations, you have a plan to purchase the appropriate quantity of additional CPU Activations, and need to use CPU core resources immediately.
	Interim Permit can be enabled in either of these two cases:
	 Interim Permit has never been used for the PPAR. This state can be confirmed by using showinterimpermit(8). If Interim Permit has never been used, showinterimpermit(8) will display "Interim Permit is disabled".
	2. Interim Permit has been used before for the PPAR, and after that use all of the following steps a to c have been performed (allowing Interim Permit to be used again):
	a. Interim Permit disabled using set interimpermit.
	b. Additional (since the last time Interim Permit was enabled) purchased CPU Activation keys registered with the system using addcodactivation(8).
	c. Additional (since the last time Interim Permit was enabled) CPU core resources assigned to the PPAR using setcod(8).

Note – Once all of above steps have been completed, the showinterimpermit(8) command shows "Interim Permit is disabled (can be enabled)" as Status.

The setinterimpermit command was introduced in XCP 2320, but with support for SPARC M10-1/M10-4 models only. Case 2 functionality was introduced in XCP 2330. When XCP 232*x* is used on the system, Interim Permit can be enabled only on SPARC M10-1/M10-4 systems, and only once. Therefore, when XCP 232*x* is used, be careful not to enable Interim Permit by mistake.

When XCP 2330 or later is used on the system, Interim Permit can be re-enabled. But, to re-enable it the steps described in case 2 above must be completed. Otherwise, using setinterimpermit to enable Interim Permit fails with an error.

If Interim Permit was used with XCP 232*x* and then the firmware was updated to XCP 2330 or later, Interim Permit cannot be enabled again, even when the steps described in case 2 above have been completed. In this case, please contact your local service provider for assistance.

After Interim Permit is enabled, warning messages are displayed on the primary/ control logical domain (and logged in XSCF) to show the remaining time until Interim Permit expires. The warning messages are displayed every four hours, beginning two weeks prior to the Interim Permit expiration date. Be sure to perform either of the following before Interim Permit expiration:

- 1. Increase the quantity of purchased CPU Activation keys:
 - a. Register additional purchased CPU Activation keys with the system by using addcodactivation(8).
 - b. Using setcod(8), set the number of CPU Activations assigned to the PPAR to be equal to or lower than the quantity of purchased CPU Activations.
 - c. Disable Interim Permit using the setinterimpermit command.
- 2. Decrease the quantity of cores in use:
 - a. Release CPU core resources from logical domains such that the total quantity of CPU core resources assigned to the logical domains is equal to or lower than the quantity of purchased CPU Activations.
 - b. Disable Interim Permit using the set interimpermit command.

For further details, please refer to the *Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide*.

The warning messages continue to be displayed until all of above steps have been performed to either increase the quantity of purchased CPU Activation keys or decrease the quantity of cores in use.

	When Interim Permit expires (after 30 calendar days), the Interim Permit function is disabled and the system goes back to "normal" CPU Activation control. In this state, if the quantity of CPU Activations assigned to the PPAR is greater than the quantity of purchased CPU Activations, a violation occurs, and a warning message is displayed. In addition, Oracle VM Server for SPARC will automatically delete CPU cores from logical domains until the quantity of assigned CPU cores is in compliance with purchased CPU Activations registered to the system. CPU cores may be deleted from any logical domain. If CPU cores cannot be deleted and the violation remains, all logical domains will be stopped. Perform the steps described in case 1 (Increase the quantity of purchased CPU Activation keys) or 2 (Decrease the quantity of cores in use) above to bring CPU Activation into compliance to complete the use of Interim Permit.		
Privileges	To execute this c	ommand, platadm privilege is required.	
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-c enable	Specify this option to enable Interim Permit for a PPAR.	
	-c disable	Specify this option to disable Interim Permit for a PPAR. The function is disabled by default.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompts with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID that is to be configured.	
	-đ	Prevents display of messages, including prompts, for standard output.	
	-У	Automatically responds to prompts with "y" (yes).	
EXTENDED DESCRIPTION	 When the command is executed, a prompt to confirm execution with the specified contents is displayed. To execute, press the [y] key. To cancel, press [n] key. To confirm the current setting information and state of Interim Permit, use 		
	showinterin		
		se of CPU core resources with showcodusage(8) or npermitusage(8) before enabling/disabling Interim Permit.	
	 The Interim Permit expiration date cannot be changed. 		
		Permit is enabled, all CPU cores are activated, and the "CPU placement Function" provided by Oracle VM Server for SPARC, ion.	

```
    Regardless of the state (enabled/disabled) of Interim Permit, showcodusage(8)

                 output will show the same outputs for quantity of purchased and registered CPU
                 Activations and the quantity of CPU core resources assigned to the PPAR. The
                 showcodusage(8) command displays the following information:
                 • If -p all or -p resource is specified, the quantity of CPU Activations
                    displayed in "CoD Permitted" does not vary depending on the state (enabled/
                    disabled) of Interim Permit. The quantity of purchased CPU Activations
                    registered with the system is always displayed.
                 ■ Also when -p all or -p ppar is specified, the quantity of CPU Activations
                    displayed under "Assigned" does not vary depending on the state (enabled/
                    disabled) of Interim Permit. The quantity of purchased CPU Activations
                    assigned to the PPAR using setcod(8) is displayed.
EXAMPLES
               EXAMPLE 1 Enable Interim Permit for PPAR-ID 0.
                XSCF> setinterimpermit -p 0 -c enable
                Note:
                  Please add CPU Activation(s) within 30 days of enabling the
                  Interim Permit.
                The Interim Permit for the PPAR will be changed to enabled.
                Continue? [y|n] :y
                Completed.
               EXAMPLE 2 Disable Interim Permit for PPAR-ID 0.
                XSCF> setinterimpermit -p 0 -c disable
                The Interim Permit will be disabled.
                Continue? [y|n] :y
                Completed.
               EXAMPLE 3 Attempt to enable Interim Permit for PPAR-ID 0 when Interim Permit has al-
                          ready been used previously.
                XSCF> setinterimpermit -p 0 -c enable
                Note:
                  Please add CPU Activation(s) within 30 days of enabling the Interim
                  Permit.
                The Interim Permit for the PPAR will be changed to enabled.
                Continue? [y|n] :y
                The Interim Permit cannot be enabled because it has already been used once
                and cannot be enabled again (until more Purchased CPU Activations are
                installed and Purchased cores are assigned to the PPAR).
```

EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

setinterimpermit(8)

NAME	setIdap - configure the Service Processor as a Lightweight Directory Access Protocol (LDAP) client.			
SYNOPSIS	setIdap [-b bind] [-B baseDN] [-c certchain] [-p] [-s servers] [-t user] [-T timeout]			
	setldap -h			
DESCRIPTION	setldap(8) allows	you to configure the Service Processor as an LDAP client.		
	Note – The LDAP client supports passwords only in the CRYPT format; UNIX Crypt or MD5. Therefore the passwords on the LDAP server must support it as well. Refer to the <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation</i> <i>and Administration Guide</i> for more information. Also note that an XSCF user account user name cannot match an LDAP user name, and an XSCF user account (UID) number cannot match an LDAP UID number.			
Privileges	You must have useradm privileges to run this command.			
	Refer to setprivileges(8) for more information.			
OPTIONS	The following opti	ons are supported:		
	-в baseDN	Specifies distinguished name for the search base. Maximum character length is 128 characters.		
	-ь bind	Sets the identity to use when binding to the LDAP server. Maximum character length is 128 characters		
	-c certchain	Imports an LDAP server certificate from the remote file specified in <i>certchain</i> . The server certificate must be in PEM format. Remote files are specified using the standard scp syntax, that is, [user@]host:file., and imported using scp. If the copy requires a user password you will be prompted for it. Use of this option implicitly enables the use of Transport Layer Security (TLS) when connecting to LDAP. This may be disabled by specifying <i>certchain</i> as none. The server certificate must be valid and have a size of less than 64 Kbytes; otherwise, it will be rejected.		
	-h	Displays usage statement.		
		When used with other options or operands, an error occurs.		
	- <u>p</u>	Sets a password to use when binding to the LDAP server. You will be prompted for the password.		

setldap(8)

	-s servers -t user -т timeout	servers is specified name or 10.8.3 the prim length is Tests co- retrieve configur Sets the	primary and secondary LDAP servers and ports. s a comma-separated list of <i>server</i> [: <i>port</i>]. Ports are d numerically and servers can be specified either by : IP address in the dotted decimal format. For example, 1.14:636, company:636. The first server in the list is hary. Server names must be resolvable. Maximum name s 128 characters. nnections to all configured LDAP servers. Attempts to the password data for the specified user from each red server and reports success or failure in each case. maximum time allowed for an LDAP search before it search results. Specify <i>timeout</i> by seconds.	
EXAMPLES	EXAMPLE 1 Configu	uring Bind	Name

setldapssl usermap {attributeInfo binddn bindpw searchbase} [v	alue]
<pre>setIdapssl default [[-q] - {y n}]</pre>	
setldapssl -h	
DESCRIPTION setldapssl configures LDAP over SSL. To enable or disable LDAP over SS execute only the command and one of those operands. To enable or disable I over SSL strictcertmode or usermapmode, specify the mode along with enable disable.	DAP
To clear or unset a property, issue a setldapssl command with no value for operand. For example, setldapssl group custom -i 1 name clears the property from custom group 1, and setldapssl usermap searchbase of the searchbase property from the optional user mapping settings. If a proper not set, it is displayed with no value.	name ears
Note – If you are an Active Directory or LDAP over SSL user, do not upload public key. If one has already been uploaded, use the following command to it:	
XSCF> setssh -c delpubkey -a -u proxyuser	

Privileges	You must have useradm privileges to run this command.			
	Refer to setprivileges(8) for more information.			
OPTIONS	The following op	The following options are supported:		
	-h	Displays usage statement. When used with other options or operands, an error occurs.		
	-i <i>n</i>	Sets an index marker, value 1 - 5. The target of index marker differs according to the operand.		
		group Index marker of the group		
		userdomain Index marker of the user domain		
		server, loadcert, rmcert Index marker of the alternate LDAP over SSL Server		
	-n	Automatically answers "n" (no) to all prompts.		
	-p proxy	Specifies the proxy server to be used for transfers. The default transfer type is http, unless modified using the -t <i>proxy_type</i> option. The value for proxy must be in the format <i>servername[:port</i>].		
	-d	Suppresses all messages to stdout, including prompts.		
	-t proxy_type	Use with the -p option to specify proxy type as http, socks4, or socks5. The default is http.		
	-u username	Specifies the user name when logging in to a remote ftp or http server that requires authentication. Prompts for a password.		
	-У	Automatically answers "y" (yes) to all prompts.		
OPERANDS	The following operands are supported:			
	enable	When used with no other operands, enable LDAP over SSL.		
	disable	When used with no other operands, disable LDAP over SSL.		

loadcert console	Prompt for certificate information to be entered at the console. Use this command to paste certificate information copied from a file. Terminate input with CTRL-D.
	Set to the primary LDAP over SSL server when -i is omitted. Set to the alternate LDAP over SSL server when -i is specified.
loadcert URL	Load a certificate file for the LDAP over SSL server. Supported formats for <i>URI</i> are:
	Specify an absolute path for a file.
	<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>
	Set to the primary LDAP over SSL server when -i is omitted. Set to the alternate LDAP over SSL server when -i is specified.
rmcert	Delete certificate for an LDAP over SSL server. strictcertmode must be in the disabled state for a certificate to be removed.
	Set to the primary LDAP over SSL server when -i is omitted. Set to the alternate LDAP over SSL server when -i is specified.
group administrator name	If <i>groupname</i> is specified, the group name is assigned to the name property of the administrator group specified by the index marker. The administrator group has the platadm, useradm and auditadm permissions, which cannot be changed. If <i>groupname</i> is omitted, the name property of the administrator group specified by the index marker, is deleted.
group operator name	If <i>groupname</i> is specified, the group name is assigned to the name property of the operator group specified by the index marker. The operator group has the platop and auditop permission which cannot be changed. If <i>groupname</i> is omitted, the name property of the operator group specified by the index marker, is deleted.
group custom name	If <i>groupname</i> is specified, the group name is assigned to the name property of the group specified by the index marker. If <i>groupname</i> is omitted, the name property of the group specified by the index marker, is deleted.

group custom roles	If <i>privileges</i> is specified, the role property of the group specified by the index marker is assigned to the group. If <i>privileges</i> is omitted, the role property of the group specified by the index marker is deleted.
userdomain	When <i>domainname</i> is specified, create user domain that is specified by index marker. When <i>domainname</i> is omitted, remove user domain that is specified by index marker.
	When logged in as username@domainname, user authentication is executed in the specified user domain and the userdomain specified by setldapssl is ignored. When logged in only with user name, user authentication is executed in the userdomain, as has been specified in setldapssl.
defaultrole	Configure default privileges. If defaultrole is configured, users have privileges as specified by defaultrole after authentication; user group membership is not checked. If defaultrole is not configured, users' privileges will be learned from the LDAP over SSL server based on group membership.
timeout <i>seconds</i>	Configure transaction timeout, in seconds. <i>seconds</i> can be 1 to 20. The default is 4. If the specified timeout is too brief for the configuration, the login process or retrieval of user privilege settings could fail.
server	Configure the primary and up to five alternate LDAP over SSL servers. To use a host name, DNS must be enabled. An IP address can be specified with port number; otherwise, the default port is used.
	Set to the primary LDAP over SSL server when -i is omitted. Set to the alternate LDAP over SSL server when -i is specified.

logdetail	Enable logging of LDAP over SSL authentication and authorization diagnostic messages at the specified detail level. This log is for use in troubleshooting and is cleared on SP reboot. Level can be one of the following:	
	none	Do not log diagnostic messages. Use this setting during normal system operation
	high	Log only high-severity diagnostic messages
	medium	Log only high-severity and medium- severity diagnostic messages
	low	Log high-severity, medium-severity, and informational diagnostic messages
	trace	Log high-severity, medium-severity, informational, and trace-level diagnostic messages
log clear	Clear the log file authorization dia	of LDAP over SSL authentication and gnostic messages.
strictcertmode	disabled by defau validation of the c is enabled, the ser uploaded to the s can be validated Data is always pr	strictcertmode mode. This mode is alt; the channel is secure, but limited certificate is performed. If strictcertmode ever's certificate must have already been erver so that the certificate signatures when the server certificate is presented. otected, even if strictcertmode is etmode applies to primary and alternate
usermapmode	attributes specifie	use of the usermap. When enabled, user ed with the usermap operand, rather are used for user authentication.

	usermap	Only if usermapmode is enabled, configure the specified usermap parameter:	
		attributeInfo	
		Use the specified attribute information for user validation	
		binddn	
		Use the specified Distinguished Name for binding with the LDAP over SSL server	
		bindpw	
		Use the specified password for binding with the LDAP over SSL server	
		searchbase	
		Configure the specified search base	
	default	Reset LDAP over SSL settings to factory default.	
EXAMPLES	EXAMPLE 1	Configures the LDAP over SSL primary server, specifying a port other than the default.	
	XSCF> setldapssl server 10.1.12.250:4040		
	EXAMPLE 2	Sets name for administrator group 3.	
		etldapssl group administrator -i 3 name CN=spSuperAdmin, \ ps,DC=Sales,DC=aCompany,DC=com	
	EXAMPLE 3	Sets name for custom group 2.	
		etldapssl group custom -i 2 name CN=spLimitedAdmin, \ ps,DC=Sales,DC=aCompany,DC=com	
	EXAMPLE 4	Sets roles for custom group 2.	
	XSCF> SC	etldapssl group custom -i 2 role auditadm,platop	
	EXAMPLE 5	Loads certificate information for Alternate Server 4 from the console.	
	Warning: . Contin	etldapssl loadcert -i 4 console About to load certificate for Alternate Server 4: nue? [y n]: y enter the certificate:

EXAMPLE 6 Configures user domain 2. <USERNAME> is a template that must be entered
          exactly as shown. During authentication the user's login name replaces
           <USERNAME>. userdomain can only take the form of Distinguished Name
           (DN).
 XSCF> setldapssl userdomain -i 2 \
 'UID=<USERNAME>,OU=people,DC=aCompany,DC=com'
EXAMPLE 7 Configures the optional user mapping attribute info setting.
 XSCF> setldapssl usermap attributeInfo \
 '(&(objectclass=person)(uid=<USERNAME>))'
EXAMPLE 8 Configures the optional user mapping bind distinguished name setting.
 XSCF> setldapssl usermap binddn CN=SuperAdmin,DC=aCompany,DC=com
EXAMPLE 9 Configures the optional user mapping bind password setting.
 XSCF> setldapssl usermap bindpw b.e9s#n
EXAMPLE 10 Configures the optional user mapping search base setting.
 XSCF> setldapssl usermap searchbase OU=yoshi,DC=aCompany,DC=com
EXAMPLE 11 Loads a server certificate for LDAP over SSL using the specified URI.
 XSCF> set1dapss1 loadcert http://domain_2/UID_2333/testcert
EXAMPLE 12 Loads a server certificate for LDAP over SSL using an http Proxy Server with
          port 8080.
 XSCF> set1dapss1 loadcert -p webproxy.aCompany.com:8080 \
 http://domain_2/UID_2333/testcert
```

	XSCF> setldaps:	server certificate for LDAP over SSL using a username and password. sl loadcert -u yoshi \ 2/UID_2333/testcert
	EXAMPLE 14 Sets log	ging of high-severity diagnostic messages.
		liagnostic messages from the log file, answering Yes to all prompts.
EXIT STATUS	The following exit	values are returned:
	0	Successful completion.
	>0	An error occurred.
SEE ALSO	showldapssl(8)	

NAME	setlocator - Sets the blinking status of the CHECK LED of the operation panel.		
SYNOPSIS	setlocator [-b bb_id] value		
	setlocator -h		
DESCRIPTION			e blinking status of the CHECK LEDs of the M12/M10 Systems chassis and crossbar boxes.
	The following sta	atuses can be set.	
	Blinking	Blinks CHECK LE	D.
	Blinking cancel	Cancels blinking o	of CHECK LED.
Privileges	To execute this co	ommand, platadm	or fieldeng privilege is required.
	For details on us	er privileges, see se	tprivileges(8).
OPTIONS	The following options are supported.		
	-ъ <i>bb_id</i>	boxes to set the bl on the system con following values f	C M12/M10 Systems chassis and crossbar inking status of the CHECK LEDs. Depending figuration, you can specify any of the or <i>bb_id</i> . If omitted, the blinking status of the s own chassis is set.
		SPARC M12-2S/M 0 to 15	110-4S (without crossbar box)
		SPARC M12-2S/M 0 to 15, 80 to 8	110-4S (with crossbar box) 33
		SPARC M12-1/M1 0	2-2/M10-1/M10-4
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.
OPERANDS	The following operands are supported.		
	value	Specifies the status following.	s of CHECK LED. You can specify either of the
		blink	Blinks CHECK LED.
		reset	Cancels blinking of CHECK LED.
l			

setlocator(8)

EXTENDED DESCRIPTION	You can confirm the status of CHECK LED set currently by using showlocator(8).
EXAMPLES	EXAMPLE 1 Blink the CHECK LED of BB-ID 1.
	XSCF> setlocator -b 1 blink XSCF>
	EXAMPLE 2 Cancel blinking of the CHECK LED of BB-ID 80.
	XSCF> setlocator -b 80 reset XSCF>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	showlocator(8)

NAME	setloginlockout - Enables or disables the lockout function when logging in.		
SYNOPSIS	<pre>setloginlockout -s unlock= time</pre>		
	setloginlockout -h		
DESCRIPTION		ut is a command to set the time when the user account cannot in login three times in a row.	
Privileges	To execute this co	mmand, useradm privilege is required.	
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following op	tions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-s unlock= <i>time</i>	Specifies the lockout time of the user account by minutes. You can specify it within the range from 0 to 1440 (24 hours). The default value is 0 minute and the lockout function is disabled.	
EXTENDED DESCRIPTION	If the lockout function for login is set, the user can try logging in three times in a row. Enter the user account name in the login prompt and press the [Enter] key, and then login will succeed. At this time, even if the user account name is entered without password or login causes timeout, it is recognized as login. If login fails three times in a low, login becomes impossible for the set period after that. The user can enter the user account name and password even during lockout, but even if the correct password is entered, the login will be rejected. Even if login fails during lockout, the lockout time is not prolonged.		
	 setloginloc lockout functio If the lockout function locked out use disabled. How again, there is disabled and e 	kout -s 0 disables the lockout function of the user account. If the on is disabled, login and failure can be repeated without limitation. Function of the user account is enabled again after disabled, the r can try logging in until the function is enabled again after ever, if login is not attempted until the lockout function is enabled no change and lockout continues as in the case that lockout is not nabled again.	
	showloginlo		
EXAMPLES		e timeout time of lockout to 90 minutes. nlockout -s 90	

setloginlockout(8)

EXIT STATUS	The following exit values are returned.	
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	showloginlocko	ut (8)

NAME		le or disable the use of the Lightweight Directory Access Protocol or authentication and privilege lookup.	
SYNOPSIS	setlookup -a {local ldap}		
	setlookup -p {	local ldap}	
	setlookup -h		
DESCRIPTION	setlookup sets whether authentication and privileges data are looked up in LDAP or not.		
Privileges	You must have u	seradm privileges to run this command.	
	Refer to setpriv	vileges(8) for more information.	
OPTIONS	The following op	otions are supported:	
	-a	Sets the authentication lookup. Used with one of the required operands ldap or local.	
	-h	Displays usage statement.	
		When used with other options or operands, an error occurs.	
	-p	Sets privileges lookup. Used with one of the required operands ldap or local.	
OPERANDS	The following operands are supported:		
	ldap	Used with the -a and -p options. When set to ldap, authentication or privileges are first looked up locally and then in LDAP if not found locally. Verify that LDAP servers have been correctly configured before executing setlookup -a ldap or setlookup -p ldap.	
	local	Used with the -a and -p options. When set to local, authentication or privileges are looked up only locally.	
EXAMPLES	EXAMPLE 1 Enab	ling LDAP Lookup of Privilege Data	
	XSCF> setloop	sup -p ldap	

setlookup(8)

EXIT STATUS	The following exit values are returned:	
	0	Successful completion.
	>0	An error occurred.
SEE ALSO	setldap(8), sh	owlookup(8)

NAME	setnameserver - Sets or deletes the name server and search path used in XSCF network.		
SYNOPSIS	setnameserver [-c add] address		
	setnameserver -c del address		
	setnameserver -c del -a		
	setnameserver -c addsearch domainname		
	setnameserver -c delsearch domainname		
	setnameserver -c delsearch -a		
	setnameserver –	h	
DESCRIPTION	setnameserver is a command to set/delete the name server and search path used in XSCF network.		
		ree name servers can be registered. If the number exceeds three, it Jp to five search paths can be registered. If the number exceeds error.	
Privileges	To execute this command, platadm privilege is required.		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-a	Deletes all of the name servers or search paths registered currently. To delete name server, use it with -c del. To delete search path, use it with -c delsearch.	
	-c add	Registers a name server. It is used with <i>address</i> . If you omit the –c option, –c add is assumed specified. To register a name server, the existing settings are deleted and the host specified by <i>address</i> is added.	
	-c addsearch	Registers a search path. It is used with <i>domainname</i> . If you omit the -c option, -c add is assumed specified. To register a search path, the existing settings are deleted and the domain name specified by <i>domainname</i> is added.	
	-cdel	Deletes a name server. If you omit the -c option, -c add is assumed specified. When you delete multiple name servers, they are deleted in the order of setting.	
	-c delsearch	Deletes a search path. If you omit the $-c$ option, $-c$ add is assumed specified. You can make multiple specifications by separating them with spaces.	

	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
OPERANDS	The following operands are supported.			
	address	Specifies the IP address of the name server to be registered or deleted. Specify it putting a period (.) between four sets of integer values. This can be specified using the following format. You can make up to three specifications by separating them with spaces.		
		xxx.xxx.xxxxxxSpecifies an integer from 0 to 255. This can be specified using zero suppression.		
		You cannot specify a loop-back address (127.0.0.0/8), network address, or broadcast address. Setting this may cause a failure in name resolution.		
	domainname	Specifies the domain name of the search path to be registered or deleted. You can make up to five specifications by separating them with spaces. <i>domainname</i> is specified within 256 characters by separating the label elements by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. At the end, put a period (.) representing the root domain (Based on RFC 1034).		
EXTENDED DESCRIPTION	 If multiple natorial order of register 	me servers are registered, name resolution is performed in the tering.		
	 The registered search path is used, for example, for referring to the name server for the host name by using nslookup(8). The host name specified by nslookup(8), followed by the domain name registered in the search path is confirmed with the name server in the FQDN format. 			
	For example, if the following command is executed after registering subdomain.example.com to the search path, hostname.subdomain.example.com is confirmed with the name server.			
	XSCF> nslookup hostname			
	 If multiple search paths are registered, domain names are attached in the order of registering and confirmed with the name server. 			
		DNS domain name set by sethostname(8) and the search path set erver within 256 characters in total.		

	 To reflect a name server and search path in XSCF, execute applynetwork(8). Reflect it in XSCF by applynetwork(8) and reboot XSCF by using rebootxscf(8), and then setting is completed. 		
	• You can confirm the contents of the name server and search path set current using shownameserver(8).		
EXAMPLES	EXAMPLE 1 Register the hosts whose IP addresses are 192.168.1.2, 10.18.108.10, 10.24.1.2 as the name server. Name resolution is performed in the order of registering.		
	XSCF> setnameserver 192.168.1.2 10.18.108.10 10.24.1.2		
	EXAMPLE 2 Delete the host whose IP address is 10.18.108.10 from the name server.		
	XSCF> setnameserver -c del 10.18.108.10		
	EXAMPLE 3 Delete all of the registered name servers.		
	XSCF> setnameserver -c del -a		
	EXAMPLE 4 Register the domain names search1.com, search2.com, search3.com, search4.com, and search5.com to the search path.		
	XSCF> setnameserver -c addsearch search1.com search2.com search3.com search4.com search5.com		
	EXAMPLE 5 Delete the domain name search5.com from the search path.		
	XSCF> setnameserver -c delsearch search5.com		
	EXAMPLE 6 Delete all of the registered domain names from the search path.		
	XSCF> setnameserver -c delsearch -a		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	applynetwork(8), sethostname(8), setsscp(8), shownameserver(8)		

setnameserver(8)

NAME	setnetwork - Sets	s or deletes the netw	ork interface to be used in XSCF.
SYNOPSIS	<pre>setnetwork [-m addr] interface address</pre>		
	setnetwork -c {up down} interface		
	setnetwork [[-q] - {y n}] -r interface		
	setnetwork -h		
DESCRIPTION	setnetwork is a XSCF.	a command to set or	delete the network interface to be used in
	The following co LAN.	ontents can be set or	deleted for the network interface of XSCF-
		nable or disable the 1	network interface
	IP addressNetmask		
		or netmask is set th	e specified network interface is enabled at the
	If an IP address or netmask is set, the specified network interface is enabled at the same time as setting.		
	If the network interface is deleted, the specified network interface is disabled at the same time as deletion. Also, if the routing information is set in the target network interface, it is deleted at the same time and its status becomes down.		
	If applynetwor IP address and n		ng down, the interface is disabled even with an
Privileges	To execute this c	ommand, platadm	privilege is required.
	For details on us	er privileges, see se	tprivileges(8).
OPTIONS	The following op	otions are supported	
	-c {up down}		to enable the specified network interface. You of the following. Omitting this causes an error.
		up down	Enables the network interface. Disables the network interface.
	-h	Displays the usag or operand causes	e. Specifying this option with another option an error.

	_			
	–m addr		hask. <i>addr</i> is specified in a format using four parated by periods (.). This can be specified ng format.	
		xxx.xxx.xxx xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.	
		_	omitted, one of the following net mask values on the IP address specified by the <i>address</i>	
		 If the specified IP address is Class A (e.g. 20.1.1.1) 		
		-	ue of 255.0.00 is set.	
			IP address is Class B (e.g. 136.18.1.1)	
		-	ue of 255.255.0.0 is set.	
			IP address is Class C (e.g. 200.18.108.1)	
		-	ue of 255.255.255.0 is set.	
	-n	Automatically res	ponds to prompt with "n" (no).	
	-đ	Prevents display o output.	of messages, including prompt, for standard	
	-r	Deletes the IP add	lress and netmask of the network interface.	
	-У	Automatically res	ponds to prompt with "y" (yes).	
OPERANDS	The following op	perands are support	ed.	
	address	-	dress. <i>address</i> is specified in a format using ers separated by periods (.).	
		xxx.xxx.xxx.xxx		
		xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.	
			y a loopback address (127.0.0.0/8), network t address, or Class D, E address (224.0.0.0 to	

L

	interface	Specifies the network interface to be set. You can specify any of the following.	
		■ For SPARC M12-2S/M10-4	4S (with crossbar box)
		xbbox#80-lan#0 xbbox#80-lan#1 lan#0	XBBOX#80-LAN#0 XBBOX#80-LAN#1 Take-over IP addresses of XBBOX#80-LAN#0 and XBBOX#81-LAN#0
		xbbox#81-lan#0 xbbox#81-lan#1 lan#1	XBBOX#81-LAN#0 XBBOX#81-LAN#0 XBBOX#81-LAN#1 Take-over IP addresses of XBBOX#80-LAN#1 and XBBOX#81-LAN#1
		■ For SPARC M12-2S/M10-4	4S (without crossbar box)
		bb#00-lan#0 bb#00-lan#1 lan#0 bb#01-lan#0 bb#01-lan#1 lan#1	BB#00-LAN#0 BB#00-LAN#1 Take-over IP addresses of BB#00- LAN#0 and BB#01-LAN#0 BB#01-LAN#0 BB#01-LAN#1 Take-over IP addresses of BB#00- LAN#1 and BB#01-LAN#1
		■ For SPARC M12-1/M12-2,	
		bb#00-lan#0 lan#0 bb#00-lan#1 lan#1	BB#00-LAN#0 Abbreviation of BB#00-LAN#0 BB#00-LAN#1 Abbreviation of BB#00-LAN#1
EXTENDED DESCRIPTION	of XSCF recog master XSCF t For SPARC M lan#0 and bb abbreviations In the followir Case that th Case that a address is s	nized in multi-XSCF configura to lan#0 or lan#1 enables acc 12-1/M12-2/M10-1/M10-4, la #00-lan#1, respectively. lan of bb#00-lan#0 and bb#00- ng cases, setnetwork causes a me same IP address as an set IF loopback address (127.0.0.0/8) specified for the IP address of a me netmask specified by -m add	1an#1, respectively. an error. ? address is specified), network address, or broadcast

Only the most significant bit is 1.

1 from the most significant bit is repeated.

- If the settings of the network interface whose status is up are as follows in SPARC M12-2S/M10-4S, it causes an error when applynetwork(8) is executed.
 - Case that the subnets of xbbox#80-lan#0, xbbox#81-lan#0, and the takeover IP address lan#0 are different
 - Case that the subnets of xbbox#80-lan#1, xbbox#81-lan#1, and the takeover IP address lan#1 are different
 - Case that some of xbbox#80-lan#0, xbbox#80-lan#1, and the SSCP link address have the same subnet
 - Case that some of xbbox#81-lan#0, xbbox#81-lan#1, and the SSCP link address have the same subnet
 - Case that some of xbbox#80-lan#0, xbbox#81-lan#1, and the SSCP link address have the same subnet
 - Case that some of xbbox#81-lan#0, xbbox#80-lan#1, and the SSCP link address have the same subnet
 - Case that the subnets of bb#00-lan#0, bb#01-lan#0, and the take-over IP address lan#0 are different
 - Case that the subnets of bb#00-lan#1, bb#01-lan#1, and the take-over IP address lan#1 are different
 - Case that some of bb#00-lan#0, bb#00-lan#1, and the SSCP link address have the same subnet
 - Case that some of bb#01-lan#0, bb#01-lan#1, and the SSCP link address have the same subnet
 - Case that some of bb#00-lan#0, bb#01-lan#1, and the SSCP link address have the same subnet
 - Case that some of bb#01-lan#0, bb#00-lan#1, and the SSCP link address have the same subnet
- If the settings of the network interface whose status is up are as follows in SPARC M12-1/M12-2/M10-1/M10-4, it causes an error when applynetwork(8) is executed.
 - Case that the subnets of bb#00-lan#0 and bb#00-lan#1 are the same
- If the IP address and netmask of the specified network interface are deleted, the routing information set in the target interface is also deleted and the status becomes down.
- If applynetwork(8) is executed after disabling the specified network interface, the network interface is disabled even with an IP address and netmask set.
- You can confirm the contents of the network interface set currently by using shownetwork(8).

	 To reflect the contents of the set network interface, execute applynetwork(8). Reflect it in XSCF by applynetwork(8), use rebootxscf(8) to reboot XSCF and then setting is completed. When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press 			
	the [n] key.			
EXAMPLES	EXAMPLE 1 Set the IP address 192.168.10.10 and netmask 255.255.255.0 in LAN#0 of BB#00.			
	XSCF> setnetwork bb#00-lan#0 -m 255.255.255.0 192.168.10.10			
	EXAMPLE 2 Set the IP address 192.168.10.10 and netmask 255.255.255.0 in LAN#0 of BB#00 in SPARC M10-1.			
	XSCF> setnetwork lan#0 -m 255.255.255.0 192.168.10.10			
	EXAMPLE 3 Disable LAN#1 of XBBOX#80.			
	XSCF> setnetwork xbbox#80-lan#1 -c down			
	EXAMPLE 4 Set the IP address 192.168.11.10 and netmask 255.255.255.0 in LAN#0 of XB-BOX#81.			
	XSCF> setnetwork xbbox#81-lan#0 -m 255.255.255.0 192.168.11.10			
	EXAMPLE 5 Set the IP address 192.168.1.10 and netmask 255.255.255.0 in the take-over IP address of LAN#0.			
	XSCF> setnetwork lan#0 -m 255.255.255.0 192.168.1.10			
	EXAMPLE 6 Delete the IP address and netmask set in LAN#0 of XBBOX#80.			
	<pre>XSCF> setnetwork -r xbbox#80-lan#0 You specified '-r' interface remove option. So, we delete routing information that interface corresponds. Continue? [y n] :y If you choose 'y'es, you must execute 'applynetwork' command for application. Or you choose 'y'es, but you don't want to apply, you execute 'rebootxscf' for reboot.</pre>			
EXIT STATUS	The following exit values are returned.

	>0 Indicates error occurrence.			

NAME	setntp - Sets the time synchronization for XSCF
SYNOPSIS	<pre>setntp -s server -c {enable disable}</pre>
	setntp [-c add] address
	setntp -c del address
	setntp -c del -a
	<pre>setntp -c stratum -i stratum_no</pre>
	<pre>setntp -c {pool server} address</pre>
	<pre>setntp -s client -c {enable disable}</pre>
	<pre>setntp -m type= value</pre>
	setntp -h
DESCRIPTION	setntp is a command to set the time synchronization for XSCF.
	In setntp, the following items can be set.
	 Whether to synchronize with upper NTP servers
	 Whether to provide NTP service to other clients as an NTP server
	 stratum value set in XSCF
	 Existence of prefer as a client
	 Clock address of the XSCF local clock
	 Whether to enable DNS round robin in a specified NTP server when XSCF is configured as the NTP client
	By default, the XSCF is not synchronized with upper NTP servers and does not provide NTP service to other clients.
	Up to three NTP servers can be registered as upper NTP servers of the XSCF network. Attempting to register four or more causes an error. In multi-XSCF configuration, the settings are automatically reflected in the master XSCF and standby XSCFs.
Privileges	To execute this command, platadm privilege is required.
	For details on user privileges, see setprivileges(8).

setntp(8)

OPTIONS	The following options are supported.		
	-a	Deletes all of the upper NTP servers set currently. It is used with -c del.	
	-c add	Adds to upper NTP servers. It is specified with <i>address</i> . If you omit the $-c$ option, $-c$ add is assumed specified. To register an NTP server, the existing settings are deleted and overwritten by the specified <i>address</i> .	
	-c del	Deletes an upper NTP server. It is specified with <i>address</i> or -a. If you omit the -c option, -c add is assumed specified. When you delete multiple NTP servers, they are deleted in the order of setting.	
	-c disable	Disables the settings of XSCF as an NTP server. It is specified with the $-s$ option. If you omit the $-c$ option, $-c$ add is assumed specified.	
	-c enable	Enables the settings of XSCF as an NTP server. It is specified with the $-s$ option. If you omit the $-c$ option, $-c$ add is assumed specified.	
	-c pool	Enables DNS round robin. DNS round robin is disabled by default.	
	-c server	Disables DNS round robin.	
	-c stratum	Sets the stratum value in the case that XSCF is set as an NTP server. If you omit the stratum value, the default is 5.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i stratum_no	Specifies stratum value. It is used with $-c$ stratum. You can specify an integer from 1 to 15.	

1			
-m type=value	Sets a preferred server or the XSCF local clock. You can specify either of the following for <i>type</i> .		
	prefer	Sets whether to give top priority to the DNS round robin-disabled NTP server that is registered first, at the time of synchronization.	
	localaddr	Sets the XSCF local clock.	
	If prefer is speci following in <i>value</i> .	fied in <i>type</i> , you can specify either of the	
	on	Top priority is given to the DNS round robin-disabled NTP server that is registered first. After that, priorities are placed on NTP servers in ascending order of stratum value. The default is on.	
	off	Priorities are placed on NTP servers in ascending order of stratum value regardless of the order of registering.	
	byte of the clock a to 3 can be specifi	pecified in <i>type</i> , specify the least significant ddress 127.127.1. <i>x</i> of the local clock in <i>value</i> . 0 ed. The default is 0 and the clock address of hat time is 127.127.1.0.	
-s server	used with -c dis- server, specify -s	se the service as an NTP server of XSCF. It is able or -c enable. To use XSCF as an NTP server with -c enable. Not to use XSCF as ecify -s server with -c disable. The able.	
-s client	NTP servers. It is synchronize XSCF specify -s client client, specify -s c	rnchronize XSCF as an NTP client with upper used with -c disable or -c enable. To as an NTP client with upper NTP servers, with -c enable. Not to set XSCF as an NTP client with -c disable. The default is -c per NTP server to synchronize can be specified	

OPERANDS	The following operands are supported.		
	address	Specifies the IP address or host name of the NTP server to be added or deleted. You can specify up to three IP addresses or host names by separating them with spaces.	
			by the IP address, <i>address</i> can be specified in a r sets of integers separated by periods (.).
		xxx.xxx.xxx.xxx	
		xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.
		characters in a fo (.). For the label and hyphens (-). alphabetic charac character for the	by the host name, specify <i>address</i> within 64 rmat separating the label elements by periods element, you can use alphanumeric characters However, make the specification using an eter for the beginning, and an alphanumeric end of the element. (Based on RFC 1034.) e DNS server, the server name needs to be
		disabling DNS ro	ur when removing an NTP server or enabling/ ound robin configuration if the server that is ss, had not been registered.
EXTENDED DESCRIPTION	 To reflect the rebootxscf 		ecessary to reboot XSCF by using
	NTP server s that has beer NTP server v	et first. However, if a registered in the fi vill be prioritized. If	P servers are set, top priority is given to the DNS round robin is enabled in the NTP server rst place, the next DNS round robin-disabled there is no DNS round robin-disabled NTP irrespective of whether it was enabled or
			pdate is executed when XSCF is started and the the time of the NTP server.
	changed by t	he difference in the	e of the physical partition (PPAR) may be time kept in XSCF. Execute the difference of the time.
	 You can conf showntp(8). 	irm the time synchr	onization currently specified by using
EXAMPLES	EXAMPLE 1 Reg	ister the three NTP se	rvers 192.168.1.2, 10.18.108.10, and 10.24.1.2 as up-

per NTP servers.

XSCF> setntp 192.168.1.2 10.18.108.10 10.24.1.2 Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 2** Delete the NTP server 10.18.108.10 set as an upper NTP server. XSCF> setntp -c del 10.18.108.10 Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 3** Register the two NTP servers: ntp1.examples.com and ntp2.example.com. XSCF> setntp ntp1.example.com ntp2.example.com Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 4** Set the stratum value used in XSCF network to 7. XSCF> setntp -c stratum -i 7 Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 5** Cancel the prefer specification of an NTP server. XSCF> setntp -m prefer=off Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 6** Set the clock address of the XSCF local clock. XSCF> setntp -m localaddr=3 Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 7** Set XSCF to an NTP client to synchronize with upper NTP server. XSCF> setntp -s client -c enable Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 8** Set XSCF to an NTP server to provide NTP service to other clients. XSCF> setntp -s server -c enable Please reset the XSCF by rebootxscf to apply the ntp settings. **EXAMPLE 9** Enable DNS round robin of a registered NTP server. XSCF> setntp -c pool ntp1.examples.com Please reset the XSCF by rebootxscf to apply the ntp settings.

EXAMPLE 10 Disable DNS round robin of all registered NTP servers.

XSCF> setntp -c server ntpl.examples.com ntp2.examples.com 10.24.1.2 Please reset the XSCF by rebootxscf to apply the ntp settings.

setntp(8)

EXIT STATUS	The following ex	kit values are returned.

NAME	setpacketfilters - Sets the IP packet filtering rules used in the XSCF network.			
SYNOPSIS	<pre>setpacketfilters [[-q] - {y n}] -c {add del} [-i interface] [-s address [/mask]] -j target</pre>			
	setpacketfilters [[-c	g]-{y n}]-cclea	ar	
	setpacketfilters [[-o	g]-{y n}]-c ipm	ni_port {enable disable}	
	setpacketfilters -h			
DESCRIPTION	setpacketfilters is a command to set the IP packet filtering rules used in XSCF network.			
	Setting the IP packet filtering rules prevents unauthorized access to the XSCF network. When setpacketfilters is executed, the setting is reflected immediately.			
Privileges	To execute this command, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-c {add del clear}	Specifies the operations for the IP packet filtering rules. You can specify any of the following. This cannot be omitted.		
		add del clear	Adds an IP packet filtering rule. Deletes an IP packet filtering rule. Deletes all of the set IP packet filtering rules.	
		However, the filter be changed.	ring rules set up by -c impi_port cannot	
	-cipmi_port	Enables/disables IP packets in respect to IPMI ports.		
{enab	{enable disable}	enable	Filtering on IPMI ports is disabled and the IPMI service used by the remote power management function (Remote Cabinet Interface over LAN: RCIL) is enabled.	
		disable	Filtering on IPMI ports is enabled and the IPMI service used by the remote power management function (Remote Cabinet Interface over LAN: RCIL) is disabled.	
		The initial value is disable, which discards IP packets in respect to IPMI ports.		

-h	Displays the usage. Specifying this option with another option or operand causes an error.			
-i interface	Specifies the XSCF network interface to set the IP packet filtering rules. You can specify any of the following.			
	■ For SPARC M12-1/M12-2/M10-1/M10-4			
	bb#00-lan#0 bb#00-lan#1		BB#00-LAN#0 BB#00-LAN#1	
	Abbreviation:			
	lan#0 lan#1		bb#00-lan#0 bb#00-lan#1	
	■ For SPARC M12	2-2S/M10-4	lS (without crossbar box)	
	bb#00-lan#0 bb#00-lan#1 bb#01-lan#0 bb#01-lan#1		BB#00-LAN#0 BB#00-LAN#1 BB#01-LAN#0 BB#01-LAN#1	
	■ For SPARC M12-2S/M10-4S (with crossbar box)			
	xbbox#80-lan#0 xbbox#80-lan#1 xbbox#81-lan#0 xbbox#81-lan#1		XBBOX#80-LAN#0 XBBOX#80-LAN#1 XBBOX#81-LAN#0 XBBOX#81-LAN#1	
	If the -i option is omitted, all XSCF networks are subject.			
	■ For SPARC M12-1/M12-2/M10-1/M10-4			
	bb#00-lan#0, bb#00-lan#1			
	• For SPARC M12-2S/M10-4S (without crossbar box)			
	bb#00-lan#0,bb#01-lan#0,bb#00-lan#1,bb#01- lan#1			
	■ For SPARC M12-2S/M10-4S (with crossbar box)			
	xbbox#80-lan xbbox#81-lan		#81-lan#0,xbbox#80-lan#1,	
-j target	Specifies the operation in the case that the rece matches the filtering rules. You can specify eith following.			
	ACCEPT DROP	Accepts p Drops IP	passing of IP packets. packets.	
-n	Automatically resp	ponds to pi	compt with "n" (no).	

	-d	Prevents display of output.	messages, including prompt, for standard	
	-s address[/mask]	Specifies the source of IP packets. It can be specified with either of the IP address, or the network IP address with the netmask (<i>/mask</i>) added.		
			network IP address can be specified in a ets of integers separated by periods (.).	
		xxx.xxx.xxx.xxx		
		xxx	Specifies an integer from 0 to 255. This can be specified using zero suppression.	
			mitted, the filtering rules are applied to all ceived in the specified network interface.	
		If / mask is omitted,	, /255.255.255.255 is specified.	
	-У	Automatically resp	onds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	the specified controlthe [n] key.The IP packet filtBe sure to set the set the sources to	P packet filtering rules are prioritized in the order of setting. re to set the sources to be accepted before limiting them by filtering. Firstly, e sources to be accepted and then the IP packets to be dropped. If the order		
	impossible.	of setting is reversed, all IP packets are dropped and communication be impossible.		
	 Setting the IP packet filtering rules may disable the network 		-	
		re and -s <i>address</i> [/ma received by XSCF-LA	<i>sk</i>] are omitted, the rules are applied to all AN.	
	 If the netmask value specified by -s <i>address</i>[/mask] does not match any of the following, it causes an error. 			
	 Only the most significant bit is 1. 			
	 1 from the most significant bit is repeated. 			
	 Rules overlapping with the set IP packet filtering rules cannot be set. 			
	 Up to 16 IP packet filtering rules can be set. However, the filtering rules set by -c ipmi_port are not included in this number. 			
	 If a message encouraging reboot of XSCF is output, reboot XSCF by using rebootxscf(8). 			
		the IP packet filtering cketfilters(8).	g rules of the XSCF network set currently	

	 When the IPMI service is enabled, it is started immediately. 			
	When using the remote power management function (Remote Cabinet Interface over LAN: RCIL), for all SPARC M12/M10 servers that are included in the remote power management group, first use setpacketfilters to enable the IPMI service and then use setremotepwrmgmt(8) to set up the remote power management function (Remote Cabinet Interface over LAN: RCIL).			
	 When the IPMI service is disabled, it is stopped immediately. 			
	When disabling the IPMI service, for all SPARC M12/M10 servers that are included in the remote power management group, disable the remote power management function (Remote Cabinet Interface over LAN: RCIL) using setremotepwrmgmt(8), beforehand. If the IPMI service is disabled while the remote power management function (Remote Cabinet Interface over LAN: RCIL) is still being enabled, the setpacketfilters will terminate abnormally.			
EXAMPLES	EXAMPLE 1 Drop the IP packets sent from the IP address 10.10.10.10.			
	XSCF> setpacketfilters -c add -s 10.10.10.10 -j DROP -s 10.10.10/255.255.255.255 -j DROP NOTE: applied IP packet filtering rules. Continue? [y n] : y			
	EXAMPLE 2 Accept only the IP packets sent from the network of 192.168.100.0/ 255.255.255.0 in communication to bb#00-lan#0 in SPARC M10-4S (without crossbar box).			
	<pre>XSCF> setpacketfilters -c add -s 192.168.100.0/255.255.255.0 -i bb#00-lan#0 -j ACCEPT -s 192.168.100.0/255.255.255.0 -i bb#00-lan#0 -j ACCEPT NOTE: applied IP packet filtering rules. Continue? [y n] :y XSCF> XSCF> setpacketfilters -c add -i bb#00-lan#0 -j DROP -s 192.168.100.0/255.255.255.0 -i bb#00-lan#0 -j ACCEPT -i bb#00-lan#0 -j DROP NOTE: applied IP packet filtering rules. Continue? [y n] :y</pre>			
	EXAMPLE 3 Delete the drop settings of IP packets set in IP address 10.10.10.10.			
	<pre>XSCF> showpacketfilters -a -s 172.16.0.0/255.255.0.0 -i bb#00-lan#0 -j DROP -s 10.10.10/255.255.255.255 -j DROP XSCF> XSCF> setpacketfilters -c del -s 10.10.10.10 -j DROP -s 172.16.0.0/255.255.0.0 -i bb#00-lan#0 -j DROP NOTE: applied IP packet filtering rules. Continue? [y n] :y</pre>			

l

	EXAMPLE 4 Delete all of the set IP packet filtering rules (excluding the rules set by -c ipmi_port).		
	XSCF> setpacketfilters -c clear (none)		
	NOTE: applied IP packet filtering rules. Continue? [y n] : y		
	EXAMPLE 5 Enable IP packets in respect to IPMI ports.		
	XSCF> setpacketfilters -c ipmi_port enable Continue? [y n] : y		
	EXAMPLE 6 Disable IP packets in respect to IPMI ports.		
	XSCF> setpacketfilters -c ipmi_port disable Continue? [y n] : y

setpacketfilters(8)

NAME	setpasswordpolicy - Manages the password policy of the system.		
SYNOPSIS	<pre>setpasswordpolicy [-d dcredit] [-e expiry] [-i inactive] [-k difok] [-l lcredit] [-M maxdays] [-m minlen] [-n mindays] [-o ocredit] [-r remember] [-u ucredit] [-w warn] [-y retry]</pre>		
	setpasswordpolicy -h		
DESCRIPTION	setpasswordp	policy is a command to change the password policy of the system.	
	These policies are executed by the XSCF on the service processor. Newly set password policies are applied to the user accounts added after execution of setpasswordpolicy.		
	When creating the user, the parameters, <i>expiry</i> , <i>inactive</i> , <i>maxdays</i> , <i>mindays</i> , and <i>warn parameters</i> , are used as the setting of the password effective period of the new account by adduser(8). The settings of the password effective periods of the existing accounts can be changed by using password(8).		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-d <i>dcredit</i> Sets the maximum credit of numbers included in a password. T minimum acceptable password length is reduced by one per a number included in the password to the value of <i>dcredit</i> . Valid values are integers from 0 to 9999999999. The default value is 1.5 Example 2.		
	-e <i>expiry</i> Sets the number of days until the effective period of a new account expires and the account becomes invalid. When a new user account is created, this value is assigned to that user account. The default value is 0. Zero indicates that the account will not expire. Valid values are integers from 0 to 999999999.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
	-i inactive	Sets the number of days from the expiration of the password to account lock. When a new user account is created, this value is assigned to that user account. The default value is -1. If the value is -1, it indicates that the account is not locked even after the expiration of the password. Valid values are integers from -1 to 999999999.	

-k <i>difok</i>	Sets the least number of new characters (characters not included in the old password) in the new password. The default value is 3.
	Valid values are integers from 0 to 999999999.
-1 lcredit	Sets the maximum credit of lower-case characters included in a password. The minimum acceptable password length is reduced by one per a lower-case character included in the password to the value of <i>lcredit</i> .
	Valid values are integers from 0 to 999999999. The default value is 1. See Example 2.
−M maxdays	Sets the maximum number of days when the password is effective. When a new user account is created, this value is assigned to that user account. The default value is 999999.
	Valid values are integers from 0 to 999999999.
-m <i>minlen</i>	Sets the minimum acceptable password length if no limit of password for credit is applied. If the credit is specified by the $-d$, $-u$, -1 , $-o$ option, the necessary password length is reduced when the specified character type is used. The default value is 9.
	Valid values are integers from 6 to 9999999999. See Example 2.
-n <i>mindays</i>	Sets the minimum number of days from a change in the password to the next change. 0 (the default value of this field) indicates that the password can be changed at any time. When a new user account is created, this value is assigned to that user account.
	Valid values are integers from 0 to 999999999.
−o ocredit	Sets the maximum credit of characters other than alphanumeric characters included in a password. The minimum acceptable password length is reduced by one per a character other than alphanumeric characters included in the password to the value of <i>ocredit</i> .
	Valid values are integers from 0 to 9999999999. The default value is 1. See Example 2.

	-r remember	Sets the number of passwords to be stored in the password history.
		The valid maximum value is 10. The default value is 3.
		The currently used password is saved to the history when the password is changed. In other words, the password before the change is stored in the history as the previous password.
		At this time, the changed (new) password is not stored in the history.
		For example, if 3 is set in <i>remember</i> , the last three passwords that were set before the currently used password are stored in the password history.
		The XSCF user cannot change to any of the passwords stored in the password history.
		Specify 0 in <i>remember</i> and execute the setpasswordpolicy command to not allow the XSCF user to change the password.
		As a result, the "Operationfailed" message will appear the next time the user attempts a password change.
	–u <i>ucredit</i>	Sets the maximum credit of upper-case characters included in a password. The minimum acceptable password length is reduced by one per an upper-case character included in the password to the value of <i>ucredit</i> .
		Valid values are integers from 0 to 999999999. The default value is 1. See Example 2.
	-w warn	Sets the default number of days until the actual expiration after the issuance of the alarm of the expiration date of the password to the user. When a new user account is created, this value is assigned to that user account. The default value is 7.
		Valid values are integers from 0 to 999999999.
	-y retry password	Sets the number of attempts to accept retries of a password when a password for the user account is changed using a command. The default value is 3.
		Valid values are integers from 0 to 999999999.
EXTENDED DESCRIPTION	You can confirm showpassword	n the password policy set currently by using apolicy(8).

setpasswordpolicy(8)

EXAMPLES	EXAMPLE 1 Set the minimum size and number of the password to be stored.		
	XSCF> setpasswordpolicy -m 12 -r 5		
	 EXAMPLE 2 Set the minimum password length and the maximum number of characters for each character type. XSCF> setpasswordpolicy -m 10 -d 1 -u 0 -l 1 -o 1 		
	Executing this command sets the minimum password length of a new password to 10 characters. If one or more numbers (or characters other than alphanumeric characters) are included, a password including 9 characters is accepted. If one number and one character other than alphanumeric characters are included, a password including 8 characters is accepted.		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	adduser(8), password(8), showpasswordpolicy(8)		

NAME	setpciboxdio - Configures each PCI slot setting of whether to enable the direct I/O function for a PCI card mounted in the PCI expansion unit for the SPARC M12-2/M12-2S/M10-4/M10-4S.		
SYNOPSIS	<pre>setpciboxdio [-b bb_id] -s {enable disable} [[-q] - {y n}] all</pre>		
	setpciboxdio [-b bb_id]	-s {enable disable}[[-q]-{y n}] slot_no	
	setpciboxdio -h		
DESCRIPTION	setpciboxdio is a command to configure enable/disable of the direct I/O function for each PCI card mounted in the PCI expansion unit for the SPARC M12 2/M12-2S/M10-4/M10-4S.		
	The direct I/O function can be configured with each PCI slot on the SPARC M12-2/M12-2S/M10-4/M10-4S. The configured settings are reflected to each PCI expansion unit connected to the specified PCI slot of the SPARC M12-2/M12-2S/M10-4/M10-4S. setpciboxdio can be executed regardless of whether a PCI expansion unit link card is mounted to the SPARC M12-2/M12-2S/M10-4/M10-4S.		
	setpciboxdio is not a	vailable for SPARC M12-1/M10-1.	
		-1, the setpciboxdio setting need not be made. The direct ed simply by connecting the PCI expansion unit to SPARC	
Privileges	To execute this command, any of the following privileges is required.		
	platadm, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-ъ bb_id	Specifies the BB-ID of the SPARC M12-2/M12-2S/M10-4/ M10-4S for which the direct I/O function is configured. You can specify any of the following values for <i>bb_id</i> .	
		For SPARC M12-2/M10-4: 0	
		For SPARC M12-2S/M10-4S (without crossbar box): an integer from 0 to 3	
		For SPARC M12-2S/M10-4S (with crossbar box): an integer from 0 to 15	
		For the SPARC M12-2S/M10-4S, omitting -b <i>bb_id</i> will apply the setting to the SPARC M12-2S/M10-4S currently being used for work.	

	-h	Displays the usag option or operand	e. Specifying this option with another l causes an error.
	-n	Automatically res	ponds to prompt with "n" (no).
	-d	Prevents display of standard output.	of messages, including prompt, for
	-s {enable disable	PCI Expansion un	er to enable the direct I/O function via it for the specified PCI slot. Any of the can be specified. When omitting the vill be occurred.
		enable disable	Enables the direct I/O function. Disables the direct I/O function.
	-У	Automatically res	ponds to prompt with "y" (yes).
OPERANDS	The following operand	ls are supported.	
			ll PCI slots on the specified server. This with the <i>slot_no</i> at the same time.
	sett. Plui inse	ings. An integer 0-10 ral slot numbers can	a PCI slot to be applied with the can be specified in no particular order. be specified at the same time by s. This operand cannot be used with the
EXTENDED DESCRIPTION		not be executed to a own server has been	crossbar box. And, omitting -b causes a crossbar box.
	containing the phys M10-4/M10-4S is tu	sical system board (Ps urned off. In other cas the PPAR is not turn	y when the power to the PPAR SB) of the target SPARC M12-2/M12-2S/ ses, the command fails with an error. ned off, an error occurs and the settings
		nction is disabled in nabled by setpcibo	the PCI slot where the direct I/O oxdio.
	 The configured sett number in SPARC 1 		when 8-10 is specified for the slot
	domain configuration M12-2S/M10-4/M1	on of the PPAR in wh 0-4S was added may	changed by setpciboxdio, the logical nich the target PSB of the SPARC M12-2/ be reset to factory-default. In this case, bles may also be initialized on SPARC

	M10-4/M10-4S. On the SPARC M12-2/M12-2S, the OpenBoot PROM environment variables of the control domain are not initialized. For details, see the latest <i>Product Notes</i> for your servers.		
	 You can confirm the current setting of direct I/O function by using showpciboxdio(8). 		
EXAMPLES	EXAMPLE 1 Enables the direct I/O function, via PCI Expansion unit, of the PCI slots 2, 3, and 7 on BB#2.		
	XSCF> setpciboxdio -b 2 -s enable 2 3 7 The Direct I/O feature via the PCIBOX will be enabled.		
	Notice: Logical domain config_name will be set to "factory-default".		
	Continue? [y n] : y		
	EXAMPLE 2 Enables the direct I/O function via PCI Expansion unit on all PCI slots of the own server.		
	XSCF> setpciboxdio -s enable -q -y all		
	EXAMPLE 3 Disables the direct I/O function via PCI Expansion unit on all PCI slots of M10-4.		
	XSCF> setpciboxdio -b 0 -s disable all The Direct I/O feature via the PCIBOX will be disabled.		
	Notice: Logical domain config_name will be set to "factory-default".		
	Continue? [y n] : y		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

setpciboxdio(8)

NAME	setpcl - Sets the physical partition (PPAR) configuration information (PCL).		
SYNOPSIS	setpcl -p ppar_id -s policy= value		
	setpcl -p ppar_id -s variable=value lsb [lsb]		
	setpcl -p ppar_id -a lsb=psb [lsb=psb]		
	setpcl -p ppar_id -r lsb [lsb]		
	setpcl -h		
DESCRIPTION	setpcl is a command to set PCL.		
	PCL is hardware resource information which can be set in PPAR or logical system boards (LSB) composing PPAR.		
	LSB is the unit of system boards recognized by Hypervisor. It is indicated by an independent integer from 00 to 15 for each PPAR.		
	The physical system board (PSB) means the boards recognized by XSCF and mounted as hardware. setpcl links LSBs with PSBs and prevents the mounted hardware resource from being used by Oracle Solaris on the logical domains, by setting up PCL.		
	In setpc1, the following information in PCL can be set. For SPARC M12-1/M12-2/M10-1/M10-4, only policy can be set.		
	Settings for PPAR:		
	 Degradation range in the case that an abnormality is detected in the initial hardware diagnosis (policy) 		
	However, it cannot be set while PPAR is in operation. To reset it, it is necessary to turn off the power of PPAR.		
	fru Degradation by part such as CPU and memory (Default)		
	psb Degradation by PSB		
	system Shutdown of the target PPAR without degradation		
	Settings for LSB:		
	 PSB number linked with LSB 		
	Specifies the PSB number to be linked with LSB.		
	 Using memory mounted in LSB (no-mem) 		
	You can set whether to make the Oracle Solaris on the logical domain use memory mounted in LSB.		
	 Using I/O device mounted in LSB (no-io) 		

setpcl(8)

	You can set whether to make the Oracle Solaris on the logical domain use I/O devices such as PCI card mounted in LSB.		
Privileges	To execute this command, platadm privilege is required.		
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-a lsb=psb	Specifies the PSB number to be linked to the LSB number of PPAR. This can be specified using the following format. You cannot specify it in SPARC M12-1/M12-2/M10-1/M10-4.	
		lsb=psb	
		<i>lsb</i> Specifies the LSB number. You can specify an integer from 0 to 15.	
		<i>psb</i> Specifies the PSB number. This can be specified using the following format.	
		<i>xx-y</i> <i>xx</i> : Specifies the BB-ID which is an integer from 00 to 15. <i>y</i> : It is fixed to 0.	
		You can specify it in a format separating <i>lsb</i> and <i>psb</i> by equal sign (=). Do not put any space before and after "=." You can specify multiple <i>lsb=xsb</i> by separating them with spaces.	
		Specifying the same LSB number and PSB number redundantly causes an error. It also causes an error that a PSB number is set in the specified <i>lsb</i> .	
		If the specified <i>psb</i> is set in another LSB, the existing settings is deleted and overwritten on the specified <i>lsb</i> .	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-p ppar_id	Specifies the PPAR-ID to be set. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
		Assigns one of the existing SPARC M12-2S/M10-4S BB-IDs in the system to a PPAR-ID. If you configure a PPAR with a non- existent SPARC M12-2S/M10-4S BB-ID specified for the PPAR- ID, the PPAR will fail to power on and be unavailable.	
	-r	Clears the PSB number linked to the LSB number of the specified PPAR. You cannot specify it in SPARC M12-1/M12-2/M10-1/M10-4.	

s variable=value	Sets the hardware resources of the PSB linked to LSB. In <i>variable</i> , the items to be set are specified. In <i>value</i> , the values for <i>variable</i> are specified. Specify just one <i>variable</i> and <i>value</i> in a format separating them by equal sign (=). Do not put any spaces before and after "=."		
	You can specify any of the following for <i>variable</i> . For SPARC M12-1/M12-2/M10-1/M10-4, you can only set policy.		
	policy	Degradation range in the case that an abnormality is detected in the initial hardware diagnosis	
	no-mem	Whether to use memory on the logical domain	
	no-io	Whether to use I/O devices on the logical domain	
	If policy is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .		
	fru	If an abnormality is detected in the diagnosis, this degrades the target Field Replaceable Unit (FRU).	
	psb	If an abnormality occurs in the diagnosis, this degrades the target PSB.	
	system	If an abnormality occurs in the diagnosis, this shuts down the target PPAR.	
	If no-mem is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .		
	true	Prohibits using memory on the logical domain.	
	false	Allows using memory on the logical domain (Default).	
	If no-io is specified in <i>variable</i> , you can specify either of the following in <i>value</i> .		
	true	Prohibits using I/O devices on the logical domain	
	false	Allows using I/O devices on the logical domain (Default).	

OPERANDS	The following operands are supported.				
	<i>lsb</i> Specifies the LSB number to be set. You can specify an integer from 00 to 15 for <i>lsb</i> . You can make multiple specifications by separating them with spaces. Specify a unique value in PPAR for <i>lsb</i> . Specifying the same <i>lsb</i> causes an error. You cannot specify it in SPARC M12-1/M12-2/M10-1/M10-4.				
EXTENDED DESCRIPTION	 If the PSB linked to the specified LSB is incorporated into PPAR configuration the contents set in LSB cannot be changed. Change them after releasing PSB fro PPAR configuration by deleteboard(8). 				
	 If the specified PPAR is in operation, the value of policy cannot be changed Change it after shutdown of the specified PPAR. 				
	• You can confirm the information of PCL set currently by using showpcl(8).				
	 If policy is changed when degradation has already occurred, degradation may be different from expected one. 				
	 Generally, there is no problem when the PPAR-ID for a PPAR being configured matches any of the existing SPARC M12-2S/M10-4S BB-IDs in the system. 				
	However, if you anticipate that the system may be reduced after operation starts, you need to consider the appropriate PPAR-ID for that case when determining the PPAR-ID. This is because any PPAR with a PPAR-ID that is the same as the BB-ID of the SPARC M12-2S/M10-4S to be removed must be stopped at the time of reduction.				
	Before configuring a PPAR, be sure to see "Chapter 4 Physical Partition Configuration" in the <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 Domain Configuration Guide</i> and check the recommended method of configuring a PPAR.				
	Note – The –s no–mem option can be specified, but it cannot prevent Oracle Solaris on logical domains from using the memory mounted on LSBs.				
EXAMPLES	EXAMPLE 1 Link LSB 0 of PPAR-ID 0 to PSB 00-0, and LSB 1 to PSB 01-0.				
	XSCF> setpcl -p 0 -a 0=00-0 1=01-0				
	EXAMPLE 2 Set policy=system in PPAR-ID 0.				
	XSCF> setpcl -p 0 -s policy=system				
	EXAMPLE 3 Delete the PSBs linked to LSB 0 and 1 of PPAR-ID 0.				
	XSCF> setpcl -p 0 -r 0 1				

l

EXIT STATUS The following exit values are returned. Indicates normal end. 0 >0 Indicates error occurrence. SEE ALSO addboard (8), deleteboard (8), setupfru (8), showboards (8), showfru (8), showpcl(8)

setpcl(8)

NAME	setpowercapping - Sets caps for power consumption.				
SYNOPSIS	setpowercapping [[-q] -{y n}] -s option= value [[-s option= value]]				
	<pre>setpowercapping [[-q] - {y n}] -c default</pre>				
	setpowercapping -h				
DESCRIPTION	setpowercapping is a command to set caps for power consumption of the system. All settings are reflected immediately.				
	All of the settings will be applied immediately after the command execution.				
	The settable items are below.				
	 Whether to enable/disable the power capping function 				
	Sets whether to enable/disable the power capping of the system. The default off (disable).				
	 Upper limit of power consumption 				
	Sets the upper limit of power consumption. You can specify wattage or percent. The default is 100 (%) by percent specification.				
	 Upper limit of power consumption (Wattage specification) 				
	Sets the upper limit of power consumption by wattage.				
	 Upper limit of power consumption (Percent specification) 				
	Sets the upper limit of power consumption by percentage.				
	Converts the minimum power consumption value (0%) and maximum power consumption value (100%) of the system to the upper limit power value (watt).				
	 Window time in the case that the upper limit is exceeded 				
	If the power consumption value of the system continues to exceed the upper limit of power consumption continuously, set the window time until it is judged as violation. The unit is second and the default is 30.				
	 System operation at the time of violation 				
	Sets the system operation if the window time elapses with the power consumption value of the system exceeding the upper limit of power consumption. You can specify any of none, shutdown, and poff. The default is none.				
	The maximum power supply of the power supply unit (PSU), and the minimum and the maximum power consumption of the system can be confirmed by using the showenvironment(8).				
Privileges	To execute this command, platadm or fieldeng privilege is required.				
	For details on user privileges, see setprivileges(8).				

setpowercapping(8)

OPTIONS	The following options are supported.			
	-c default	Initializes the entire power capping function.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-n	Automatically responds to pr	rompt with "n" (no).	
	-đ	Prevents display of messages output.	s, including prompt, for standard	
	-s option=value	In <i>option</i> , the items to be set are specified. In <i>value</i> , the values for <i>option</i> are specified. Specify <i>option</i> and <i>value</i> in a format separating them by equal sign (=). Do not put any spaces before and after "=." You can make multiple specifications by separating them with spaces.		
		You can specify any of the following for option.		
		activate_state	Sets whether to cap power consumption.	
		powerlimit_p	Sets the upper limit of power consumption by percentage (%). You cannot specify this with powerlimit_w.	
		powerlimit_w	Sets the upper limit of power consumption by wattage. You cannot specify this with powerlimit_p.	
		timelimit	Sets the window time in the case that power consumption exceeds the upper limit.	
		violation_actions	Sets the system operation when the window time elapsed with the upper limit exceeded.	

		If activate_state is specified in <i>option</i> , you can specify either of the following in <i>value</i> .		
		enabled disabled	Caps power consumption. Does not cap power consumption (default).	
		If powerlimit_p is specified in <i>option</i> , you can specify an integer from 0 to 100 for <i>value</i> . You can specify a value which is larger than the maximum power consumption of the system, but cannot specify a value which is less than the minimum power consumption of the system.		
		If powerlimit_w is specified in <i>option</i> , you can specify an integer from 0 to 99999 for <i>value</i> .		
		If timelimit is specified in <i>option</i> , you can specify an integer from 10 to 99999 for <i>value</i> . The unit is second. Any of the following values also can be specified.		
		default	Sets the grace period for exceeding the upper limit of power consumption to 30 seconds.	
		none	Sets the grace period for exceeding the upper limit of power consumption to 0 second.	
		If violation_actions is specified in <i>option</i> , you can specify either of the following in <i>value</i> .		
		none	Outputs only the message for exceeding the upper limit (Default).	
		shutdown	Shuts down the physical partition (PPAR) below the upper limit after outputting the message for exceeding the upper limit.	
		poff	Forcibly shuts down PPAR below the upper limit after outputting the message for exceeding the upper limit.	
	-У	Automatically resp	oonds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	 You can confir showpowerca 		ding power capping by using	
	 If all of the following conditions are met while the Logical Domains (LDom Manager of a PPAR is halted, the performances of other PPARs may drop o PPARs themselves may be shut down. Case that the power capping function of the system is enabled 			

	 Case that the power consumption value of the system exceeds the upper limit of power consumption 					
	 When you changed the configuration of the logical domain, execute the ldm add-spconfig on the control domain, to store the latest configuration information in XSCF. If you do not store the information, the PPAR stop processing which has been set by using the -s violation_actions may fail to work properly. 					
	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 					
EXAMPLES	EXAMPLE 1 Enable the power capping of the system.					
	<pre>XSCF> setpowercapping -s activate_state=enabled activate_state :disabled -> enabled powerlimit :500w -> - timelimit :30 -> - violation_actions :none -> -</pre>					
	The specified options will be changed. Continue? $[y n]: \mathbf{y}$ configured.					
	activate_state :enabled powerlimit :500w timelimit :30					
	violation_actions :none					
	EXAMPLE 2 Set the upper limit of system power consumption to 75%.					
	XSCF> setpowercapping -s powerlimit_p=75					
	activate_state :enabled -> -					
	powerlimit :25% -> 75%					

powerlimit :25% -> 75% timelimit :30 -> violation_actions :none -> -The specified options will be changed. Continue? [y|n]:y configured. activate_state :enabled powerlimit :75% timelimit :30 violation_actions :none

EXAMPLE 3 Set the upper limit of system power consumption to 1000 W and the window time in the case that power consumption exceeds the upper limit to 100 seconds.

XSCF> setpowercapping -s powerlimit_w=1000 -s timelimit=100
activate_state :enabled -> powerlimit :500w -> 1000w
timelimit :30 -> 100
violation_actions :none -> -

	The specified	options will be changed.
	Continue? [y n configured.]: y
		:enabled
	powerlimit	:1000w
	timelimit violation_acti	
	vioincion_acci	
EXIT STATUS	The following exi	t values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	showenvironmer	nt(8), showpowercapping(8)

setpowercapping(8)

NAME	setpowerschedule - Enables or disables the power schedule of a physical partition (PPAR), or sets the power recovery information.		
SYNOPSIS	setpowerschedu	<pre>le {-p ppar_id -a } -c control={enable disable}</pre>	
	setpowerschedu	<pre>le {-p ppar_id -a } -c recover={on off auto}</pre>	
	setpowerschedu	le -h	
DESCRIPTION	setpowerschedule is a command to enable or disable a PPAR power schedule and to set whether to turn on the power at the time of power recovery.		
	Schedule operati	on can be set for the entire PPARs or each PPAR.	
Privileges	To execute this c	ommand, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-a		
	Sets for all PPARs.		
	-c control={enable disable}		
	Enables/Disables the power schedule of the specified PPAR. To enable it, specify enable. To disabled it, specify disable. The default is off (disable).		
	-crecover={on off auto}		

		Sets whether to turn on the power at the time of resumption of power. You can specify any of the following.	
	on	Reverts back to the same power status before power failure (default). Turns on the power if the PPAR was powered on before the power failure.	
	off	Does not turn on the power.	
	auto	If the time of power recovery is within the scheduled operation period (within the scheduled period from power-on to power-off), power is turned on. If it is outside of the scheduled operation period, power is not turned on. If either power-on or power-off is not scheduled, it is regarded as outside of the scheduled operation period and power is not turned on.	
		Example 1: If it is scheduled to power on at 9 and to	
		power off at 13 - If power recovered at 10: power will be turned on - If power recovered at 15: power will not turned on	
		Example 2: If it is scheduled to power on at 9 but has no power-off schedule	
		- If power recovered at 10 or at 15: power will not be turned on in either case	
	-h		
	Displays the us causes an error	sage. Specifying this option with another option or operand	
	-p ppar_id		
		PAR-ID to set schedule operation. Depending on the system you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
EXTENDED DESCRIPTION	schedule setting lir (PCNS) is a differe Sets only one of the set by the schedule disabling the powe	ble power system (UPS) connection configuration, the hk function of the Power Chute Network Shutdown Enterprise ent function from schedule setting by setpowerschedule. ese functions for schedule. If both of them are set, the schedule e setting link function of PCNS cannot be suspended by er schedule set by setpowerschedule or suspending hs (holiday setting).	
	 You can confirm the showpowersched 	ne schedule operation information set currently by using ule(8).	
	 Specifying a non-e error. 	xistent PPAR-ID or invalid option or parameter causes an	

	• When you changed the configuration of the logical domain, execute the ldm add-spconfig on the control domain, to store the latest configuration information in XSCF. If you do not store the information, the automatic power-off processing may fail to work properly.		
EXAMPLES	EXAMPLE 1 Enable the schedule operation of PPAR-ID 1.		
	XSCF> setpowerschedule -p 1 -c control=enable XSCF>		
	EXAMPLE 2 Set so that the power of PPAR-ID 1 can be turned on according to schedule operation at the time of resumption of power.		
	XSCF> setpowerschedule -p 1 -c recover=auto XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

setpowerschedule(8)

NAME	setpowerupdelay - Sets the warm-up operation time of the system and the wait time for air conditioning.		
SYNOPSIS	setpowerupdelay -p ppar_id -c warmup -s time		
	setpowerupdela	y -a -c warmup -s time	
	setpowerupdela	y -c wait -s <i>time</i>	
	setpowerupdela	y -h	
DESCRIPTION	setpowerupdelay is a command to set the warm-up operation time of the system and the wait time for air conditioning.		
	The wait time for air conditioning can be used for control such as starting the system after waiting for the temperature to become appropriate by air conditioning in the data center. If the input power of the system has already been turned on and the system is in operation, the set contents will be enabled next time when the system is started.		
	The warm-up operation wait time is set for each physical partition (PPAR).		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Sets a warm-up operation time for all PPARs.	
	-c warmup	Sets the warm-up operation time.	
	-cwait	Sets the wait time for air conditioning.	
		Note – The wait time for air conditioning is not supported at SPARC M12/M10.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-p ppar_id	Specifies the PPAR to set the warm-up operation time.	
	-p ppar_id -s time	Specifies the warm-up operation time or the wait time for air conditioning by minutes. You can specify an integer from 0 to 255 for <i>time</i> .	
EXTENDED DESCRIPTION	 You can confine set currently b 	rm the warm-up operation time and wait time for air conditioning by using showpowerupdelay(8).	

setpowerupdelay(8)

	 If the power is turned on by using testsb(8), the warm-up operation time and wait time for air conditioning are ignored. To monitor these times at start, use poweron(8). If the system is powered on using the operation panel, the waiting time for air conditioning is ignored.
EXAMPLES	EXAMPLE 1 Set the warm-up operation time to 10 minutes.
	XSCF> setpowerupdelay -p 00 -c warmup -s 10
	EXAMPLE 2 Set the wait time for air conditioning to 20 minutes.
	XSCF> setpowerupdelay -c wait -s 20
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>poweron(8), showpowerupdelay(8), testsb(8)</pre>

NAME	setpparmode - Sets the operation mode of the physical partition (PPAR).		
SYNOPSIS	setpparmode [[-q] - {y n}] -p <i>ppar_id</i> -m <i>function=mode</i>		
	setpparmode -h		
DESCRIPTION	setpparmode is a command to set the operation mode of PPAR.		
	The type of the operation modes of PPAR are below.		
	Diagnostic level		
	Diagnostic level of Power-On Self-Test (POST). Set this while PPAR is not in operation. The default is standard. When the command is executed, the setting is reflected immediately.		
	Message level		
	Detailed level of the console message of the POST diagnosis. Set this while PPAR is not in operation. The default is standard. When the command is executed, the setting is reflected immediately.		
	Alive Check (the monitoring between XSCF and Hypervisor)		
	Whether to enable or disable Alive Check. The default is on (enable). When the command is executed, the setting is reflected immediately.		
	Operation after the Host Watchdog (the monitoring between Hypervisor and the logical domain) timeout		
	Operation of logical domain (including control domain) at the time of Host Watchdog timeout. By default, logical domain is reset. When the command is executed, the setting is reflected immediately.		
	Break signal (STOP-A) suppression		
	Whether to enable or disable break signal transmission suppression. The default is on (enable). When the command is executed, the setting is reflected immediately.		
	Autoboot of the guest domain		
	Whether to autoboot the guest domain when PPAR is started. The default is on (enable). To reflect the setting, PPAR must be powered on or reboot.		

l

Power Aware Dispatcher function

Enables or disables the power-saving operation that uses Solaris Power Aware Dispatcher. Solaris Power Aware Dispatcher is used when the Power Aware Dispatcher function (PAD function) is enabled. The function is enabled by default. You cannot set it on the SPARC M10-1/M10-4/M10-4S.

The PAD function and the power-saving operation have the following combinations of settings.

- When the PAD function is enabled, you can set any of the following for the power-saving operation: disabled, performance, or elastic
- When the PAD function is disabled, you can set either of the following for the power-saving operation: disabled or elastic

If the power-saving operation is set to disabled or elastic, the operation does not differ between the two PAD function settings. It is set when the PPAR is stopped.

When the PAD function changes from disabled to enabled, or vice versa, the logical domain configuration information reverts to the factory-default state. In this case, the logical domains must be reconfigured.

If the power-saving operation is set to performance, the PAD function cannot change to disabled. To disable the function, you have to set the power-saving operation to disabled or elastic beforehand.

Note – For PAD function support information, see the latest version of the *Fujitsu SPARC M12 Product Notes*.

Power-saving operation

Sets the power-saving operation of CPUs or memory. In the SPARC M12, set it with the powermgmt_policy option. In the SPARC M10, set it with the elastic option. The default is off (disable). When the command is executed, the setting is reflected immediately.

If the Power Aware Dispatcher function is disabled, the power-saving operation setting cannot be changed to performance.

I/O bus reconfiguration (ioreconfigure)

Whether to reconfigure I/O bus according to the bus configuration when PPAR is powered on or reset. The default is off (disable). Execute the command while PPAR is not in operation. You cannot set it in SPARC M12-1/M10-1.

CPU operational mode

If SPARC64 X+ processors exist, you have to consider whether to operate with SPARC64 X+ functions or with SPARC64 X functions. The default value is auto mode. The auto mode makes automatic judgment on whether to operate with SPARC64 X+ functions or SPARC64 X functions.

If the PPAR is not stopped (in the status other than Powered Off), an error is produced.

To find out whether the PPAR is using SPARC64 X+ functions or SPARC64 X functions, execute the following command on Oracle Solaris:

```
# psrinfo -pv
```

You cannot set the CPU operational mode in SPARC M12-2/M12-2S.

auto mode

This mode is used to automatically judge whether to operate with SPARC64 X+ functions or not. If this mode is set, depending on the PPAR CPU configuration, the following operations are executed automatically when Oracle Solaris is boots up:

<In case all CPUs in the PPAR are SPARC64X+>

- Oracle Solaris can use the functions of SPARC64 X+ processors.
- PSBs with SPARC64 X+ processors can be added to PPARs, using DR.
- PSBs with SPARC64 X processors cannot be added to PPARs, using DR. When adding SPARC64 X processors to PPARs, the PSBs on which they are mounted, should be added to the PPARs after powering them off.
 <In case CPUs in the PPAR are either a mixture of SPARC64 X and SPARC64 X+ processors or all are SPARC64 X processors>
 - Oracle Solaris cannot use the functions of SPARC64 X+ processors.
 - PSBs with either SPARC64 X or SPARC64 X+ can be added to PPARS, using DR.
 - Please note that in case of PPARs setup with this mode, if no SPARC64 X processor remains in the PPAR after a reset due to some malfunctions, SPARC64 X processors may not be added to the PPAR, using DR. To avoid this, PPARs which contain SPARC64 X processors, should be set up in the compatible mode.

	 compatible mode SPARC64 X compatible mode. This mode enforces SPARC64 X compatibility in the case of a mixture of SPARC64 X and SPARC64 X processors and also in the case of only SPARC64 X+ processors in the PPAR. Use this mode if there are PPARs with SPARC64 X processor-mounted PSBs or if you intend to use DR to add SPARC64 X processor to PPARS in the future. When this mode is set, Oracle Solaris cannot use the functions of SPARC64 X+ processors. When this mode is set, both SPARC64 X processor-mounted PSBs a SPARC64 X+ processor-mounted PSBs can be added to the PPARs 	
	using DR. PPAR DR feature	
	Set up the physical sy default this	enabling/disabling of the incorporation or detachment of rstem boards (PSB) to / from a running PPAR configuration. By s feature is enabled. To reflect the setup, it is necessary to power of the PPAR. This setup is not available for SPARC M12-1/M12-2/ 0-4.
	the configu default afte Reconfigur	R DR setup is enabled from disabled or, disabled from enabled, uration information of the logical domain reverts back to factory- er the physical partition is reset. For details refer to "2.5 Dynamic ration Operation Conditions and Settings" of <i>Fujitsu SPARC M12</i> <i>M10/SPARC M10 Domain Configuration Guide</i> .
	If any of the oper contents is displa	ation modes of PPAR is selected, the list of the current setting yed.
Privileges	To execute this co	mmand, any of the following privileges is required.
	 Diagnostic level, message level, autoboot of the guest domain 	
	fieldeng	Enables execution for all PPARs.
	autoboot of the	peration at the time of Host Watchdog timeout, break signal, e guest domain, Power Aware Dispatcher function, power-saving nfiguration of I/O buses, CPU operational mode, PPAR DR
	platadm	Enables execution for all PPARs.
	pparadm	Enables execution for PPARs for which you have administration privilege.

l

	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		

m function=mode	Sets the operation mode and value. Specify the operation mode for <i>function</i> . You can specify any of the following.			
	diag Sets the diagnostic level of POST.			
	message Sets the detailed level of the console message of POST diagnosis.			
	alive_check Sets whether to enable or disable Alive Check.			
	watchdog_reaction Sets the operation at the time of Host Watchdog timeout.			
	break_signal Sets whether to enable or disable break signal suppression.			
	<pre>guestboot Sets whether to enable or disable autoboot of the guest domain. Note - The setpparparam(8) sets whether to enable or</pre>			
	disable autoboot of the control domain.			
	pad Enables or disables the Power Aware Dispatcher function. You cannot set this on the SPARC M10-1/M10-4/M10-4S.			
	elastic Sets the power-saving operation of CPUs or memory in the SPARC M10-1/M10-4/M10-4S. This feature cannot be setup on SPARC M12-1/M12-2/M12- 2S.			
	<pre>powermgmt_policy Sets the power-saving operation of CPUs or memory in the SPARC M12-1/M12-2/M12-2S. This feature cannot be setup on SPARC M10-1/M10-4/M10- 4S.</pre>			
	ioreconfigure Sets whether to enable or disable reconfiguration of I/O buses when PPAR is started or restarted. This feature cannot be setup on SPARC M12-1/M10-1.			
	cpumode Sets CPU operational mode. This feature cannot be setup on SPARC M12-1/M12-2/M12- 2S.			
	ppar_dr Enable or disable the PPAR DR feature. This feature cannot be setup on SPARC M12-1/M12-2/M10-1/ M10-4.			

If diag is specified in <i>function</i> , you can specify either of the following in <i>mode</i> . Set this while PPAR is not in operation.		
off min	Does not make a diagnosis. Sets the diagnostic level to "standard" (Default).	
max	Sets the diagnostic level to "Maximum."	
	ified in <i>function</i> , you can specify either of the Set this while PPAR is not in operation.	
none	The diagnosis output is not displayed until a failure is detected.	
min	Displays the limited volume of the diagnosis output.	
normal	Displays an appropriate volume of the diagnosis output (Default).	
max	Displays the complete diagnosis output including the names of diagnoses performed and the results.	
debug	Displays a wide diagnosis output including the debug output of each diagnosis.	
	preak_signal, guestboot, or ppar_dr is n, you can specify either of the following for	
on	Enables alive check, break signal transmission control, autoboot of the guest domain, or PPAR DR feature.	
off	Disables alive check, break signal transmission control, autoboot of the guest domain, or PPAR DR feature.	
If watchdog_reaction is specified in <i>function</i> , you can either of the following in <i>mode</i> .		
none	None.	
dumpcore	Generates panic in the logical domain where an abnormality is detected.	
reset	Resets the logical domain where an abnormality is detected.	

If pad is specified in <i>function</i> , you can specify either of following in <i>mode</i> .	
on	Enables the Power Aware Dispatcher function (Default).
off	Disables the Power Aware Dispatcher function. To set this mode, powermgmt_policy must be disabled or elastic.
If elastic is specifollowing in <i>mode</i> .	ified in <i>function</i> , you can specify either of the
off	Disables power-saving operation of CPU and memory (default). All CPUs and memory in the system operate normally at the highest performance.
on	Enables power-saving operation of CPU and memory. Changes system power usage according to the current utilization levels of CPUs and memory. This can reduce system power consumption.
If powermgmt_pol either of the follow	icy is specified in <i>function</i> , you can specify ring in <i>mode</i> .
disabled	Disables power-saving operation of CPU and memory (default). All CPUs and memory in the system will continuously operate at the highest performance.
elastic	Enables power-saving operation of CPU and memory. Changes system power usage according to the current utilization levels of CPUs and memory. This can reduce system power consumption.
performance	Enables power-saving operation of CPU. This can save power without much of an effect on performance because unused, idle CPUs in the system operate at slower speeds or may have entered the sleep state. To set this mode, pad must be on.
	t information on the power-saving operation, on of the <i>Fujitsu SPARC M12 Product Notes</i> .

		If ioreconfigure of the following in	e is specified in <i>function</i> , you can specify either <i>mode</i> .		
		true Every time the power of the system is turned on, XSCF confirms I/O buses and reconfigure them, if necessary.			
		false	XSCF does not reconfigure I/O buses.		
		nextboot	Only when the power is turned on next time, XSCF reconfigures the I/O buses. It is automatically set to false after reconfiguration.		
		If cpumode is specified in <i>function</i> , you can specify either of the following in <i>mode</i> :			
		auto Depending on the CPU configuration at the time of OS boot, automatically determines whether the SPARC64 X+ functions can be used.			
		compatible	Enforces SPARC64 X compatibility, even if SPARC64 X+ processors are mounted.		
	-n	Automatically resp	ponds to prompt with "n" (no).		
	-p ppar_id		R-ID to set the operation mode. Depending on uration, you can specify an integer from 0 to 15		
	-đ	Prevents display of messages, including prompt, for standard output. Automatically responds to prompt with "y" (yes).			
	-У				
EXTENDED DESCRIPTION		ecute the command, a prompt to confirm whether to execute it with contents is displayed. To execute, press the [y] key. To cancel, press			
	 The operation but the setting 		armode does not display the actual operation		
	The actual ope operation pane	eration varies accord el. If the mode switc le of PPAR is set as	ling to the status of the mode switch of the ch of the operation panel is "Service," the follows regardless of the contents set by

setpparmode(8)

NAME		xecute forced rewriting of OpenBoot PROM environment variables or deletion of boot scripts of the control domain.	
SYNOPSIS	setpparparam [[-q]-{y n}]-p <i>ppar_id</i> use-nvramrc		
	setpparparam [[·	-q]-{y n}]-p ppar_id security-mode	
	setpparparam [[·	-q]-{y n}]-p <i>ppar_id</i> set-defaults	
	setpparparam [[·	-q]-{y n}]-p ppar_id -s bootscript value	
	setpparparam [[·	-q]-{y n}]-p <i>ppar_id</i> -s bootscript -r	
	setpparparam -h		
DESCRIPTION	setpparparam is a command to execute forced rewriting of OpenBoot PROM environment variables and registration or deletion of boot scripts of the control domain.		
	You can set the fo	ollowing OpenBoot PROM environment variables.	
	use-nvramrc?	Whether to execute the contents of NVRAM when PPAR is started or restarted	
	security-mode	Setting of the security level of the firmware	
Privileges	To execute this command, any of the following privileges is required.		
	platadm, fieldeng	Enables execution for all physical partitions (PPARs).	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on use	er privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specify the PPAR-ID of the target control domain. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .	
		Note – Set this while PPAR is not in operation.	

	-d	Prevents display of messages, including prompt, for standard output.
	-r	Deletes the set bootscript.
	-s bootscript	Register or delete boot scripts. If specified along with <i>value</i> , the value of <i>value</i> is registered as the boot script. If specified along with $-r$, the registered boot script will be deleted. Only one boot script can be registered. If several boot scripts are specified, the last boot script will be enabled.
	-у	Automatically responds to prompt with "y" (yes).
OPERANDS	The following operands are supported.	
	use-nvramrc	Sets the environment variable use-nvramrc? to false.
	security-mode	Sets the environment variable security-mode to none.
	set-defaults	Restores the OpenBoot PROM environment variables to the default.
	value	Specify the boot script to be registered. Enter the value enclosing it in double quotation marks ("). You can set it within 254 characters. When specifying the OpenBoot PROM environment variables, input a line feed after every setenv command.
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 	
		tpparparam only when the target PPAR is powered off. An error it is executed when the PPAR is powered on.
	The OpenBoot PROM variables can be rewritten by registering the setenv commands in the boot script. However, as the use-nvramrc? and security- mode variables are used before the execution of the boot script, these variables cannot be rewritten by the boot script.	
	powering on of	hat are setup with setpparparam are effective only at the next f the PPAR. To execute forced rewriting of OpenBoot PROM ariables and registration or deletion of boot scripts, set them again parparam.
EXAMPLES	EXAMPLE 1 Set the 0 to fa	e OpenBoot PROM environment variable use-nvramrc? of PPAR-ID alse.
	PPAR-ID of PPAR	param -p 0 use-nvramrc Rs that will be affected:0 variable use-nvramrc will be set to false.] :

EXAMPLE 2	Set the OpenBoot PROM environment variable security-mode of PPAR-		
	0 to none.		

XSCF> setpparparam -p 0 security-mode
PPAR-ID of PPARs that will be affected:0
OpenBoot PROM variable security-mode will be set to none.
Continue? [y|n]:

EXAMPLE 3 Initialize the OpenBoot PROM environment variables of PPAR-ID 0 to the default.

```
XSCF> setpparparam -p 0 set-defaults
PPAR-ID of PPARs that will be affected:0
All OpenBoot PROM variables will be reset to original default values.
Continue? [y|n]:
```

EXAMPLE 4 Initialize the OpenBoot PROM environment variables of PPAR-ID 1 to the default. The message is hidden and the prompt is automatically given a "y" response.

XSCF> setpparparam -q -y -p 1 set-defaults

EXAMPLE 5 Set up the boot script of PPAR-ID 0. To rewrite several environment variables, put a line feed after each setenv command and include the whole command in double quotes ("").

```
XSCF> setpparparam -p 0 -s bootscript "setenv auto-boot? true
setenv input-device virtual-console
setenv output-device virtual-console"
PPAR-ID of PPARs that will be affected:0
OpenBoot PROM variable bootscript will be changed.
```

Continue? [y|n]:

EXAMPLE 6 Clear the bootscript of PPAR-ID 0.

XSCF> setpparparam -p 0 -s bootscript -r
PPAR-ID of PPARs that will be affected:0
OpenBoot PROM variable bootscript will be cleared.
Continue? [y|n]:

- **EXIT STATUS** The following exit values are returned.
 - 0 Indicates normal end.
 - >0 Indicates error occurrence.
 - **SEE ALSO** setpparmode (8), showpparparam (8)

setpparparam(8)

NAME	setprivileges - Assigns the user privileges.		
SYNOPSIS	setprivileges user [privileges] [pparprivilege @ ppars]		
	setprivileges –h		
DESCRIPTION	setprivileges is a command to assign the user privileges to the XSCF user account.		
	It is only the user privileges of XSCF that can be changed by setprivileges. You can assign up to 100 user accounts to one privilege. You can set multiple user privileges for a user account separating them with spaces. For the list of user privileges, see "OPERANDS."		
	pparop, pparmgr, and pparadm privileges are the user privileges which can be specified for each physical partition (PPAR). For details, see "OPERANDS" and Example 1.		
	If no user privilege is specified, setprivileges deletes all privilege data on XSCF of the specified user account. If the reference of the user privileges to Lightweight Directory Access Protocol (LDAP) is enabled, the privilege data of the user account is referred to in LDAP.		
	If none is assigned to the user account, no privilege is given to the target user account regardless of the contents of the privilege data in LDAP.		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		

OPERANDS	The following operand	ds are supported.	
	pparprivilege@ppars		
	Specifies pparadm, pparmgr, or pparop privileges for one or more PPARs.		
		es of the user privileges which can be assigned to each PPAR It is specified with @ <i>ppars</i> . You can specify any of the	
	pparadm	Enables all operations regarding hardware assigned to the PPARs to which privileges are assigned (assignment, assignment cancellation, power operation, etc.). It enables display of the statuses of all hardware assigned to the PPARs to which privileges are given. It enables execution of all operations regarding the PPARs to which privileges are given. It enables display of all statuses of the PPARs to which privileges are given.	
	pparmgr	Enables restarting, starting, and shutting down the PPARs to which privileges are given. It enables display of the statuses of all hardware assigned to the PPARs to which privileges are given. It enables display of all statuses of the PPARs to which privileges are given.	
	pparop	Enables display of the statuses of all hardware assigned to the PPARs which have privileges. It enables display of the statuses of all PPARs which have this privilege.	
	ppars	 Specifies one or more PPARs for the appropriate value for <i>pparprivilege</i> attaching the @ sign and <i>ppars</i> descriptor. To specify PPAR, use it attaching PPAR-ID after the @ sign. Example: pparadm@3-4 If PPARs are specified by range, specify by separating the beginning and end of the PPARs included in the range by "" Example: pparadm@3-4 To specify multiple PPARs or PPAR ranges, separate 	
		them by commas (,). Overlapping specification of PPARs causes an error. Example: pparadm@1-2,4	

privileges

Specifies the user privileges which affect the entire system. You can specify any of the following.

	any of the following.	
	auditadm	Enables display and setting of all audit statuses and audit trails.
	auditop	Enables display of all audit statuses and audit trails.
	fieldeng	Enables all operations limited to the field engineers and service engineers.
	none	If privileges are set for the user in LDAP, no operation regarding the service processor requiring user privileges can be executed. The administrator can limit access to such operations on the service processor and PPAR by using this privilege.
	platadm	Enables execution of the settings of all XSCFs excluding the contents which can be executed by the useradm and auditadm privileges. It enables assignment of hardware to PPAR and cancellation of assignment from PPAR to hardware. It enables power operations for the PPAR and XSCF. It enables operations regarding fail-over of XSCF units. It enables display of all statuses of platforms.
	platop	Enables display of all statuses of platforms but they cannot be changed.
	useradm	Enables creation, deletion, enabling, and disabling of user accounts. It enables changes in user passwords and password policies. It enables changes in user privileges.
	user	
	Specifies a valid	user name.
EXAMPLES		adm privilege for the user account (JSmith), and the pparadm r PPAR-ID 1 to 4 and 6.
	XSCF> setprivileges jsmith platadm pparadm@1-4,6,9	
	EXAMPLE 2 Delete all p	rivileges set in the user account (JSmith).
	XSCF> setprivilege	es jsmith none
EXIT STATUS	The following exit valu	ies are returned.
	0 Indica	tes normal end.
	>0 Indica	tes error occurrence.

NAME		gmt - Set up the remote power management function (Remote over LAN: RCIL) of SPARC M12/M10 systems.
SYNOPSIS	<pre>setremotepwrmgmt -c config [-V] [-u user] [-X proxy [-t proxy_type]] [-y -n] configuration_file</pre>	
	setremotepwrmg	gmt -c enable [-y -n]
	setremotepwrmg	gmt -c disable [-y -n]
	setremotepwrmg	gmt -h
DESCRIPTION	setremotepwrmgmt is a command to perform the following settings regarding the remote power management function.	
	 Constructing 	the remote power management group
	 Changing the 	settings of the remote power management group
	 Disabling the remote power management function of the remote power management group 	
	 Enabling the remote power management function of the remote power management group 	
	over LAN: RCIL	remote power management function (Remote Cabinet Interface), enable IP packets in respect to IPMI ports using cers(8), beforehand. If the IPMI service is disabled, this command poormally.
Privileges	To execute this c	ommand, platadm or fieldeng privilege is required.
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following options are supported.	
	-c config	Reads the management information file of the remote power management group and constructs or changes the settings of the remote power management group by transferring the settings to the host controller. It is used for initialization, addition, removal, and replacement of the devices whose powers are to be linked.
	-c disable	Disables the remote power management function of all the set remote power management groups. It is used when starting maintenance of the devices whose powers are to be linked.
	-c enable	Enables the remote power management functions of all the set remote power management groups. Used when maintenance of the devices whose powers are to be linked is completed.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.

	-n	Automatically responds to prompt with "n" (no).
	-t proxy_type	Specifies the proxy type. It is used with the -X option. You can specify any of http, socks4, and socks5. The default is http.
	-u <i>user</i>	Specifies your user name when logging in to remote FTP or HTTP server requiring authentication. The command will display a prompt for password entry.
	-v	Displays detailed information. This option is used to diagnose network and server problems.
	-x proxy	Specifies the proxy server to use for transfer. If -t <i>proxy_type</i> is not specified together, the default proxy type is http. <i>proxy</i> is specified in the format of <i>servername:port</i> .
	-У	Automatically responds to prompt with "y" (yes).
OPERANDS	The following operands are supported.	
	configuration_file	Specifies the URL where the management information file of the remote power management group to use for setting exists.
		The following types of format are supported.
		Specify an absolute path for a file.
		<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>
EXTENDED DESCRIPTION	 While setrem the same group 	otepwrmgmt is executed, do not execute setremotepwrmgmt for p ID.
	 If the remote power management device (host node) to be added to the remote power management group is registered to another group, delete the management information by using clearremotepwrmgmt(8) in advance. 	
	set a network o	config, -c enable, and -c disable by setremotepwrmgmt, of the IPv4 format for all remote power management devices in the power management group and turn on the resident power.
	format of the r	of the management information file to CSV. For details on the management information file, see the <i>Fujitsu SPARC M12 and PARC M10 System Operation and Administration Guide</i> .
		to create the management information file for each group. If one nformation file has multiple group IDs, it causes an error.

	setremotepwrmgmt(8)		
	 If the password to access the distribution destination of the information is not set in the management information file and the default user is not specified, it is required to enter the password when distributing the information of the remote power management group. In the first configuration of the remote power management group, execute setremotepwrmgmt in the following procedure. 		
	1. Execute setremotepwrmgmt -c config and construct the remote power management group.		
	2. Execute setremotepwrmgmt -c enable and enable the remote power management function of the constructed remote power management group.		
	 To update a constructed remote power management group, execute setremotepwrmgmt in the following procedure. 		
	 Execute setremotepwrmgmt -c disable and disable the remote power management function of the constructed remote power management group to be updated. 		
	 Execute setremotepwrmgmt -c config and update the settings of the remote power management group. 		
	3. Execute setremotepwrmgmt -c enable and enable the remote power management function of the updated remote power management group.		
	 If -c config is specified and the target remote power management group has been constructed and the remote power management function is enable, it causes an error. 		
	 If -c enable or -c disable is specified and no remote power management group is constructed, it causes an error. 		
	 When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key. 		
EXAMPLES	EXAMPLE 1 Construct the remote power management group 1 reading the management information file on the FTP server.		
	<pre>XSCF> setremotepwrmgmt -c config ftp://dataserver/data/rpmgroup.1.conf Download successful: 29184Byte at 1016.857KB/s Checking file MD5: e619e6dd367c888507427e58cdb8e0a1 The following Remote power management group setting will be applied:</pre>		
	GroupID :01 NodeID NodeType NodeIdentName PowerLinkage Operation		
	001 Master HOST XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX		

Continue? [y|n]: \mathbf{y}

_ _

```
Enter password for user [xxx] on host [zz.zz.zz.zz]:
   :
   The command completed successfully.

```

EXAMPLE 2 Construct the remote power management group 2 reading the management information file on the USB memory.

```
XSCF> setremotepwrmgmt -c config file:///media/usb_msd/path/rpmgroup.2.conf
Mounted USB device
Download successful: 29184Byte at 1016.857KB/s
Checking file ...
MD5: e619e6dd367c888507427e58cdb8e0a1
The following Remote Power Management Group setting will be applied:
GroupID :02
NodeID NodeType NodeIdentName
                             PowerLinkage
                                         Operation
_____ ____
001
   TPMT
   002
                                          TPMT
_____ ____
```

```
Continue? [y|n]: y
Enter password for user [xxx] on host [xx.xx.xx]:
Enter password for user [xxx] on host [yy.yy.yy.yy]:
Enter password for user [xxx] on host [zz.zz.zz.zz]:
:
The command completed successfully.
XSCF>
```

EXAMPLE 3 Enable the remote power management function.

```
\label{eq:scc} \begin{array}{l} \text{XSCF} > & \textbf{setremotepwrmgmt -c enable} \\ \text{Remote power management is enabled. Continue? [y|n]: } \textbf{y} \\ \text{The command completed successfully.} \\ \text{XSCF} > & \end{array}
```

EXAMPLE 4 Disable the remote power management function.

```
XSCF> setremotepwrmgmt -c disable
Remote power management is disabled. Continue? [y|n]: \mathbf{y}
The command completed successfully.
XSCF>
```

EXAMPLE 5 In case the operation failed because IPMI service had been disabled.

XSCF> setremotepwrmgmt -c config ftp://dataserver/data/ rpmgroup.1.conf IPMI service is disabled. Please enable IPMI service by the "setpacketfilters".

The following exit values are returned. EXIT STATUS Indicates normal end. 0 >0 Indicates error occurrence. SEE ALSO clearremotepwrmgmt(8), getremotepwrmgmt(8), setpacketfilters(8), showremotepwrmgmt(8)

setremotepwrmgmt(8)

NAME	setremotestorage - Manages connection to remote storage.
SYNOPSIS	setremotestorage -c config interface address [-m addr] [-g addr]
	setremotestorage -c clear interface
	setremotestorage [[-q] - {y n}] -c attach interface target
	setremotestorage [[-q] - {y n}] -c detach interface
	setremotestorage -h
DESCRIPTION	setremotestorage manages connection to a remote storage over XSCF-LAN.
	Remote storage is usually used over XSCF Web.
	setremotestorage configures the following, which can also be configured on XSCF Web.
	 Connect to or disconnect from remote storage.
	 Specify the network interface through which remote storage can be accessed over a slave XSCF.
	The following operations should be performed before connecting to or disconnecting from remote storage, using XSCF Web or the setremotestorage command.
	1. Start"XSCF Remote Storage Server" which provides remote storage selection screen.
	2. Select a PC drive or ISO file.
	3. Start remote storage.
	After performing the aforesaid operations, connecting to or disconnecting from remote storage can be performed using either XSCF Web or the setremotestorage command.
	Meanwhile, when connecting to a remote storage, only one of the XSCF-LAN network interface of master XSCF, standby XSCF or slave XSCF can be used.
	Moreover, when connecting to remote storage over a slave XSCF, the XSCF-LAN network interface of the slave XSCF should be configured before starting the "XSCF Remote Storage Server" remote storage selection screen.
	For details on operations relating to remote storage, refer to "4.6 Using the Remote Storage" of Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide.
Privileges	To execute this command, platadm or fieldeng privilege is required.
	For details on user privileges, see setprivileges(8).

OPTIONS	The following options are supported.	
	-c config	Configures slave XSCF network interface. For example, if remote storage is connected to chassis BB#02, specify bb#02-lan#0 or bb#02-lan#1 as the <i>interface</i> . The configured content is used only when connection is made to the remote storage. The "telnet" or "ssh" services cannot be used.
		This option is not supported on SPARC M12-1/M12-2/M10-1/M10-4.
	-c clear	Deletes slave XSCF network interface configuration.
		This option is not supported on SPARC M12-1/M12-2/M10-1/M10-4.
	-c attach	Connect to remote storage.
	-c detach	Disconnect from remote storage.
	-m addr	Configures the netmask of the <i>interface</i> . Specify four sets of integers from 0 to 255 placing periods (.) between them. The integer can be specified using zero suppression.
		If this option is left out, the netmask value will be set up in the following way:
		■ If the specified IP address is Class A (e.g. 20.1.1.1)
		A netmask value of 255.0.0.0 is set.
		• If the specified IP address is Class B (e.g. 136.18.1.1)
		A netmask value of 255.255.0.0 is set.
		 If the specified IP address is Class C (e.g. 200.18.108.1) A netmask value of 255.255.255.0 is set.
	-g addr	Specifies a dedicated default gateway address for a remote storage. Specify four sets of integers from 0 to 255 placing periods (.) between them. The integer can be specified using zero suppression. If this option is left out, no dedicated gateway will be configured.
		Do not specify the loopback address (127.0.0.0/8), the network address or the broadcast address as the default gateway address.
	-d	Prevents display of messages, including prompt, for standard output.

	-у	Automatically responds to prompt with "y" (yes).
	-n	Automatically responds to prompt with "n" (no).
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
OPERANDS	The following op	perands are supported.
	interface	Specifies the network interface that is to be set up. Any of the following can be specified:
		■ For SPARC M12-2S/M10-4S (with crossbar box)
		bb#00-lan#0 : BB#00-LAN#0
		bb#00-lan#1 : BB#00-LAN#1
		bb#01-lan#0 : BB#01-LAN#0
		bb#01-lan#1 : BB#01-LAN#1
		 bb#14-lan#0 : BB#14-LAN#0
		bb#14-lan#1 : BB#14-LAN#1
		bb#15-lan#0 : BB#15-LAN#0
		bb#15-lan#1 : BB#15-LAN#1
		■ For SPARC M12-2S/M10-4S (without crossbar box)
		bb#00-lan#0 : BB#00-LAN#0
		bb#00-lan#1 : BB#00-LAN#1
		bb#01-lan#0 : BB#01-LAN#0 bb#01-lan#1 : BB#01-LAN#1
		bb#01-lan#1 : BB#01-LAN#1 bb#02-lan#0 : BB#02-LAN#0
		bb#02-lan#1 : BB#02-LAN#1
		bb#03-lan#0 : BB#03-LAN#0
		bb#03-lan#1 : BB#03-LAN#1
		However, in case of the -c config or -c clear option, <i>interface</i> cannot be specified for bb#00 and bb#01.
		■ For SPARC M12-1/M12-2/M10-1/M10-4
		bb#00-lan#0 : BB#00-LAN#0 bb#00-lan#1 : BB#00-LAN#1
	address	Specifies slave XSCF network interface IP address. Specify four sets of integers from 0 to 255 placing periods (.) between them. The integer can be specified using zero suppression.
		However, class D or class E addresses (from 224.0.0.0 to 255.255.255) cannot be specified here.

	target	Specifies the IP address or host name of remote storage. Specifies the IP address or host name of the PC on which "XSCF Remote Storage Server" has been started. In case of IP address, specify four sets of integers from 0 to 255 placing periods (.) between them. The integer can be specified using zero suppression. The host name must be resolvable by DNS servers.
EXTENDED DESCRIPTION	address as the display of a ru The following In case the duplicate of	ne loopback address (127.0.0.0/8), network address or broadcast IP address of slave XSCF network interface, will result in the ile violation message. configuration of slave XSCF network interface will result in error: configured IP address of slave XSCF network interface is a f the IP address of the XSCF network interface of the master XSCF, CF or another slave XSCF, or a takeover IP address or an SSCP link
	same subne If the netmask following, it ca Only the m	ost significant bit is 1.
	 The maximum a single SPAR a remote stora executed in re- these options, Remote storag setremotest information of 	in a row from the most significant bit. a number of remote storages that can be connected concurrently to C M12/M10 chassis is only one. Moreover, if already connected to ge, the -c config, -c clear and -c attach options cannot be spect to the connected network interface. If you want to execute first disconnect the remote storage. re configurations change simultaneously with the execution of corage. Meanwhile, if XSCF has been rebooted, the configuration slave XSCF network interface will be retained but the connection storage will be cutoff.
EXAMPLES	XSCF> setremo	p the BB#02-LAN#00 network interface. testorage -c config bb#02-lan#0 10.26.147.222 -m 0 -g 10.26.147.1
	M10-4 XSCF> setremo	o the BB#00-LAN#0 (master XSCF) network information on SPARC 4S (without crossbar box). Atestorage -c config bb#00-lan#0 10.26.147.220 Atwork for Master or Standby BB.

	EXAMPLE 3 Connect to remote storage by specifying the master XSCF.		
	XSCF> setremotestorage -c attach bb#00-lan#0 10.20.43.26 Remote Storage Server will be attached. Continue? [y n] : y		
	EXAMPLE 4 Connect to remote storage by specifying an unconfigured building block of network interface. The confirmation message will be automatically answered as "y".		
	XSCF> setremotestorage -c attach bb#03-lan#0 remote- server.example.com -y		
	Remote Storage Server will be attached. Continue? $[y n] : \mathbf{y}$ bb#03-lan#0 has not been configured for connection. Please check the network settings.		
	EXAMPLE 5 Disconnect from remote storage by specifying the network interface that is connected to the remote storage.		
	XSCF> setremotestorage -c detach bb#02-lan#0 Remote Storage Server will be detached. Continue? $[y n] : y$		
	EXAMPLE 6 Disconnect from remote storage by specifying a network interface that is not connected to the remote storage. The confirmation message will be automatically answered as "y".		
	XSCF> setremotestorage -c detach bb#03-lan#0 -y Remote Storage Server will be detached. Continue? [y n] : y		
	EXAMPLE 7 Delete the setup information of the network interface for remote storage on BB#04-LAN#1.		
	XSCF> setremotestorage -c clear bb#04-lan#1		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	applynetwork (8), showremotestorage (8)		

NAME	setroute - Sets the routing information of the XSCF network interface.		
SYNOPSIS	<pre>setroute -c {add del} -n address [-m address] [-g address] interface</pre>		
	setroute -h		
DESCRIPTION	setroute is a co interface.	ommand to set the re	couting information of the XSCF network
		of the routing inform ceeds eight, it causes	nation can be registered per network interface. es an error.
Privileges	To execute this c	ommand, platadm j	privilege is required.
	For details on us	er privileges, see se	etprivileges(8).
OPTIONS	The following op	ptions are supported	l.
	-c {add del}		tion for the routing information. You can he following. Omitting this causes an error.
		add del	Adds the routing information. Deletes the routing information.
	-g address	specified in standa separated by peric	way address used for routing. <i>address</i> is ard format using four sets of integers ods (.). For example, for <i>xxx.xxx.xxx.xxx</i> , an 255 is specified for each <i>xxx</i> . This can be ero suppression.
		You cannot specify address, or broadc	y a loop-back address (127.0.0.0/8), network cast address.
	-h	Displays the usage or operand causes	e. Specifying this option with another option s an error.

-m <i>address</i>	Specifies the netmask to be the destination of the routing information. <i>address</i> is specified in standard format using four sets of integers separated by periods (.). For example, for <i>xxx.xxx.xxx</i> , an integer from 0 to 255 is specified for each <i>xxx</i> . This can be specified using zero suppression. If the netmask is specified, the network applying the netmask to the address specified by -n is set as the target of routing.
	If $-m$ option is omitted or 0.0.0.0 is specified for the netmask when the destination IP address is other than 0.0.0.0, the following netmasks are set depending on the address specified by the $-n$ option.
	 If the specified address is Class A If the host part of the address (lower 24 bits) is 0 (Example: 20.0.0.0)
	A netmask value of 255.0.0.0 is set. If the host part of the address (lower 24 bits) is other than 0 (Example: 20.18.108.10)
	A netmask value of 255.255.255.255 is set.
	 If the specified address is Class B
	If the host part of the address (lower 16 bits) is 0 (Example: 136.18.0.0)
	A netmask value of 255.255.0.0 is set.
	If the host part of the address (lower 16 bits) is other than 0 (Example: 136.18.108.10)
	A netmask value of 255.255.255.255 is set.
	 If the specified address is Class C
	If the host part of the address (lower 8 bits) is 0 (Example: 200.18.108.0) A netmask value of 255.255.255.0 is set.
	If the host part of the address (lower 8 bits) is other than 0 (Example: 200.18.108.10)
	A netmask value of 255.255.255.255 is set.
	If 0.0.0.0 is specified by the -n option, specify 0.0.0.0 for the -m option or omit the -m option.

	-n address	information. <i>address</i> is specifi sets of integers separated by <i>xxx.xxx.xxx</i> , an integer fro This can be specified using z If 0.0.0.0 is specified in <i>address</i> set. However, Class D and E 255.255.255.255) cannot be sp	s, the default routing information is address (224.0.0.0 to	
OPERANDS	01	perands are supported.		
	interface	the following.	ce to be set. You can specify any of	
		■ For SPARC M12-2S/M10-4	4S (with crossbar box)

EXTENDED	 In the following 	ng cases, setroute causes an	error.	
DESCRIPTION	 Case that n 	nore than 8 routings are to be s	et	
	 Case that the netmask specified by -m <i>addr</i> does not correspond to any of the following 			
	- Only the most significant bit is 1.			
	-	e most significant bit is repeate	d.	
	- All bits are 0.			
			the take over IP (1 an #0 or 1 an #1)	
		an SPARC M12-1/M12-2/M10	the take-over IP (lan#0 or lan#1) -1/M10-4	
	 Only the routing 	ing information added by set	route can be deleted.	

		ateway addresses of the routing information have any addresses not d in each XSCF-LAN network, executing applynetwork(8) causes an	
		Ibnets of the IP address to be the destination of the routing information net of the SSCP link are overlapping, executing applynetwork(8) causes	
	it in XSO	ct the set routing information in XSCF, execute applynetwork(8). Reflect CF by applynetwork(8), use rebootxscf(8) to reboot XSCF and then is completed.	
		confirm the routing information of the XSCF network interface set y by using showroute(8).	
EXAMPLES	EXAMPLE 1	Add the routing with the destination and netmask set to 192.168.1.0 and 255.255.255.0, respectively, to XBBOX#80-LAN#0.	
	XSCF> se lan#0	etroute -c add -n 192.168.1.0 -m 255.255.255.0 xbbox#80-	
	EXAMPLE 2	Add the routing with the destination and netmask set to 192.168.1.0 and 255.255.255.0, respectively, to BB#00-LAN#0 of SPARC M12-1/M12-2/M10-1/M10-4.	
	XSCF> setroute -c add -n 192.168.1.0 -m 255.255.255.0 lan#0		
	EXAMPLE 3	Add the routing with the destination and gateway set to 192.168.1.0 and 192.168.1.1, respectively, to XBBOX #80-LAN#1.	
	XSCF> setroute -c add -n 192.168.1.0 -g 192.168.1.1 xbbox#80-la		
	EXAMPLE 4	Add the routing with the destination set to 192.168.1.0 and the default net- mask (255.255.255.0) to XBBOX #80-LAN#1.	
	XSCF> se lan#1	etroute -c add -n 192.168.1.0 -m 255.255.255.0 xbbox#80-	
	EXAMPLE 5	Delete the routing with the destination set to 192.168.1.0 and the default net- mask (255.255.255.0) to XBBOX #80-LAN#1.	
	XSCF> se lan#1	etroute -c del -n 192.168.1.0 -m 255.255.255.0 xbbox#80-	
	EXAMPLE 6	Add the routing with the destination set to 192.168.1.4 to BB#00-LAN#1.	
	XSCF> Se	etroute -c add -n 192.168.1.4 bb#00-lan#1	

	EXAMPLE 7 Delete the routing with the destination set to 192.168.1.4 to BB#00-LAN#1.
	XSCF> setroute -c del -n 192.168.1.4 bb#00-lan#1
	EXAMPLE 8 Add the routing with the gateway set to 192.168.10.1 by default to BB#00-LAN#1.
	XSCF> setroute -c add -n 0.0.0.0 -g 192.168.10.1 bb#00-lan#1
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	setservicetag - Enables or disables the servicetag agents.		
SYNOPSIS	setservicetag -c {enable disable} [-v]		
	setservicetag -h		
DESCRIPTION	setservicetag is a command to enable or disable the servicetag agents. The new settings take effect after the XSCF is rebooted by using rebootxscf(8). Servicetags provide information platform, type, chassis serial number, etc, on platforms that support it.		
Privileges	To execute this comm	and, platadm privilege is required.	
	Refer to setprivile	ges(8) for more information.	
OPTIONS	The following options	are supported:	
	-c enable	Enables the servicetag agents.	
	-c disable	Disables the servicetag agents.	
	-h	Displays usage statement. When used with other options or operands, an error occurs.	
	-v	Specifies verbose output.	
EXAMPLES	EXAMPLE 2 Disabling XSCF> setservicet	ag -c enable effect the next time the XSCF is rebooted. the servicetag agents.	
EXIT STATUS	The following exit val	ues are returned:	
	0 Succe	essful completion.	
	>0 An e	rror occurred.	
SEE ALSO	showservicetag(8)		

setservicetag(8)

NAME	setsmtp - Sets the Simple Mail Transfer Protocol (SMTP) service.	
SYNOPSIS	setsmtp [-v]	
	setsmtp [-s variable= value]	
	setsmtp -h	
DESCRIPTION	setsmtp is a command to set the SMTP service.	
	If this is used without specifying any options, it is required to enter the SMTP e- mail server name to be used, port name to be used for e-mail for transmission, and Reply-To address. Confirm that the e-mail address specified here is valid. If the $-s$ option is specified, you can set up the SMTP setting value non-interactively.	
	Setting the e-mail server and port by using setsmtp enables transmission of test mail setting e-mail report by setemailreport(8).	
Privileges	To execute this command, platadm privilege is required.	
	For details on user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.	
	-h Displays the usage. Specifying this option with another option or operand causes an error.	

	mailserver Specifies the IP address or server name. If a server name is specified, it is necessary to enable name-resolution.
	port Specifies the port address for reply.
	auth Specifies the authentication method. The valid values are below. none, pop, smtp-auth
	user Specifies the user name to be the authentication information for the SMP mail server.
	password Specifies the password to be the authentication information for the SMP mail server.
	replyaddress Specifies the only one address for reply. For the e-mail addresses that are used with the setsmtp, see EXTENDED DESCRIPTION.
	popserver Specifies an IP address or a server name for the popserver. Server name, if specified, must be resolvable.
-V	Displays detailed information.
 The e-mail address format, which is The local-parthis format: local-parthis format:	a the information of SMTP set currently by using showsmtp(8). esses that are used with the setsmtp should be in the following based on "3.4.1. Addr-Spec Specification" of RFC5322. t and the domain should be combined by the "@" character in ocal-part@domain, the local-part should not contain more than 64 e domain should not contain more than 255 characters and the as a whole should not contain more than 256 characters g character strings can be used in the local-part: Imnopqrstuvwxyz HJKLMNOPQRSTUVWXYZ
	 You can confirm The e-mail addr format, which is The local-par this format: lo characters, th mail address The following abcdefghijkl ABCDEFGF

	More The c adde The c More The 1 - abcc - ABC - 0123 The h	dot (.) cannot be used as the first or last character of the local-part. eover, two or more of this character cannot be used consecutively. domain should be specified as a combination of its constituent labels, d by a dot (.), in this format: label1.label2. dot (.) cannot be used as the first or last character of the domain part. eover, two or more of this character cannot be used consecutively. abels, which are part of domains, may contain the following characters: defghijklmnopqrstuvwxyz CDEFGHIJKLMNOPQRSTUVWXYZ 3456789 hyphen (-) cannot be used as the first character of a label. one address for reply can be specified. The multiple addresses cannot be
	speci	
	Note – De	epending on the mail server, the above symbols may not be used.
	3.2.1. quoto 3.2.2. CFW 3.2.4. quoto 3.4.1. doma	te following formats as defined in RFC5322 are not supported: ed-pairs, as defined in "Quoted Characters". 'S, FWS, comment, as defined in "Folding White Space and Comments". ed-strings, as defined in "Quoted Strings". ain-literal, as defined in "Addr-Spec Specification". olete formats described in "Obsolete Syntax".
EXAMPLES	EXAMPLE 1	Set up the mail server without specifying the authentication method in the non-interactive mode.
	XSCF> Se	etsmtp -s mailserver=10.4.1.1 -s auth=none
	EXAMPLE 2	Set up with POP authentication specified as the authentication method in non-interactive mode.
	XSCF> SC	etsmtp -s auth=pop -s user=jsmith -s password=*****
	EXAMPLE 3	Set up with SMTP authentication (SMTP-auth) specified as the authentication method and 587 specified as the port address for reply in interactive mode.

NAME	setsnmp - Manages the SNMP agent.			
SYNOPSIS	<pre>setsnmp enable [mib_name]</pre>			
	<pre>setsnmp disable [mib_name]</pre>			
	setsnmp addtraphos	st -t type -s community-string [-p trap-port] traphost		
	<pre>setsnmp remtraphost -t type [-s community-string] [-p trap-port] traphost</pre>			
	<pre>setsnmp addv3traphost -u username -r authentication-protocol {-n engine_id -i} [-x encryption-protocol] [-a authentication-password] [-e encryption- password] [-p trap-port] traphost</pre>			
	setsnmp remv3trap	nost -u username [-p trap-port] traphost		
	setsnmp enablev1v2	2c read-only-community-string		
	setsnmp disablev1	v2c		
	setsnmp [-1 system-location] [-c system-contact] [-d system-description] [-p agent-port]			
	setsnmp default			
	setsnmp -h			
DESCRIPTION	setsnmp is a command to not only define the setting value of the SNMP agent but also enable or disable the SNMP agent.			
Privileges	To execute this command, platadm privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-c system-contact	Specifies the contact of the system of the agent.		
	-d system-description	Specifies the explanation of the system of the agent.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-1 system-location	Specifies the location of the system of the agent.		
	-p agent-port	Specifies the listen port of the agent. The default is 161.		
	-s community-string	Works much like the password controlling access to the SNMP v1 and v2 agents. It is an interceptable plane text character string. addv3traphost is used to encrypt and hide the password.		

OPERANDS	The following o	perands are supported.
	addtraphost	Enables transmission of the selected type of trap from the SNMP agent to the target host. If <i>trap-port</i> is not specified, the default is 162. Community string is required.
		addtraphost has the following options and operands.
		 -p <i>trap-port</i> Specifies the ID of trap port. The default is 162. -s <i>community-string</i> Works much like the password controlling access to the SNMP v1 and v2 agents. It is an interceptable plane text character string. addv3traphost is used to encrypt and hide the password. -t <i>type</i> Specifies the type of trap. The valid types of trap are below.
		 v1 = The agent sends the SNMPv1 trap. v2 = The agent sends the SNMPv2 trap. inform = The agent sends information notification.
		<i>traphost</i> Specifies the traphost name or the IP address.
	1	

addv3traphost	Enables the transmission or notification of the SNMPv3 trap from the SNMP agent to the target host. It is necessary to select the authentication protocol. The valid protocols are below.
	MD5 = Uses the Message Digest 5 (MD5) algorithm for authentication.
	SHA = Uses Secure Hash Algorithm (SHA) for authentication.
	The encryption protocol is to be selected. The valid protocols are as follows. If none of these protocols are specified, the Data Encryption Standard (DES) protocol is used.
	DES = Use Data Encryption Standard (DES) for encryption.
	AES= Use Advanced Encryption Standard (AES) for encryption.
	If no password option is used, it is required to enter the password. The password is read but not echoed to the screen. addv3traphost has the following options and operands.
	 -a <i>authentication-password</i> Sets the authentication password. It needs to have eight or more characters.
	 e encryption-password Sets the encryption password. It needs to have eight or more characters.
	-i Requests the receiving host for acknowledgment.
	-n engine_id Sets the ID of the local agent to send trap. You can specify the engine ID of the local SNMP agent, but even if not specified, this needs to match the engine ID expected by the receiving host. It needs to begin with "0x" and be composed of an even number of hex characters. If not, it causes an error.
	-p <i>trap-port</i> Specifies the ID of trap port. The default is 162.
	-r authentication-protocol
	Sets the authentication protocol. -u <i>username</i>
	Specifies the user name.
	-x <i>encryption-protocol</i> Specifies the encryption protocol.
	traphost
	Specifies the traphost name or the IP address.

encodingure SNMP before restarting the SNMP agent. disable Shuts down the SNMP agent, if used alone. If it is used with the value ALL of mib_name of the option, the SNMP agent is shut down. If it is used with other than the value ALL of mib_name of the option, the support for the target MIB module is deleted. If the support for another MIB module is maintained, the SNMP agent remains enabled. If the supports for both MIB modules are deleted, the SNMP agent is disabled and shut down. Just one mib_name can be specified at a time. mib_name This is the name of the MIB module to be disabled. The valid MIB modules are below. • SP_MIB = XSCF extension MIB • ALL = All MIB modules in this list disablev1v2c Disables the communication of the SNMP agent using SNMPv1 or SNMPv2c. NAME	setsnmpusm - Se	ets the User-based S	ecurity Model (USM) of the SNMPv3 agent.
SYNOPSIS	setsnmpusm create -a <i>authentication_protocol</i> [-x <i>encryption-protocol</i>] [-p <i>authentication_password</i>] [-e <i>encyrption_password</i>] user		
	setsnmpusm de	lete user	
	setsnmpusm cl	one -u clone_user	user
	setsnmpusm pa <i>user</i>	sswd [-c{auth er	<pre>ncrypt}][-o old_password][-n new_password]</pre>
	setsnmpusm -h		
DESCRIPTION	setsnmpusm is	a command to set th	ne USM of the SNMP agent.
Privileges	To execute this c	command, platadm	privilege is required.
	For details on us	ser privileges, see se	etprivileges(8).
OPTIONS	The following options are supported.		
	-h	Displays the usag or operand causes	e. Specifying this option with another option s an error.
OPERANDS	The following o	perands are support	ed.
	clone		comes to be recognized by the agent with the ne specified <i>clone_user</i> in the subsequent SNMP
		-u clone_user user	Specifies the user name to create clone. Specifies another user name to create a clone of <i>clone_user</i> .

create	settings in the subs without specifying require the passwo it is not echoed to the Advanced Data En (DES) can be used connections. When used by default. M algorithm or Secure	be recognized by the agent with the specified equent SNMP communication. If it is used the -e option or -p option, the prompt to rd is displayed and the password is read, but the screen. In the setsnmpusm, either cryption (AES) or Data Encryption Standard as encryption protocols to be used in SNMP none of these protocols are specified, DES is oreover, either Message Digest 5 (MD5) e Hash Algorithm (SHA) can be used as rocols in such connections.		
	user			
	Specifies the us	ser name.		
	-a authentication_p	rotocol		
	Specifies the authentication protocol. You can specify either of MD5 or SHA.			
	-e encryption_password			
	Specifies the encryption password. Specify 8 or more characters.			
	-p authentication_password			
	Specifies the authentication password. Specify 8 or more characters.			
	-x encryption_protocol			
		yption protocol. Either DES or AES can be n none is specified, DES is used.		
delete	Makes the specified subsequent SNMP	d user unrecognized by the agent in the communication.		
	user	Specifies the user name.		

	Changes the password of the specified user. Either authentication password or encryption password can be changed. If the -c option is not specified, both are applicable. If the -c option is not specified, the authentication password needs to match the encryption password. If not, it causes an error. If no option is specified, the prompt to require the password is displayed. The password is read but not displayed on the screen.		
	 -c auth encrypt Specifies the password to be changed. For the authentication password and encryption password, specify auth and encrypt, respectively. -n new_password 		
	Specifies a new password. Specify 8 or more characters. -o old_password Specifies an old password.		
	user		
	Specifies the user name.		
EXTENDED DESCRIPTION	More users cannot be registered when the total number of characters in the entries, which are registered by executing the following three commands, exceed 8000.		
	 Registered trap hosts by setsnmp(8) 		
	 Registered users by setsnmpusm(8) 		
	 Registered groups, views and accesses by setsnmpvacm(8) 		
	The present SNMP agent setting information can be confirmed by showsnmp(8), showsnmpusm(8) and showsnmpvacm(8).		
EXAMPLES	EXAMPLE 1 Add a user specifying the password.		
	XSCF> setsnmpusm create -a SHA -p xxxxxxxx -e yyyyyyyy jsmith		
	EXAMPLE 2 Add a user without specifying the password.		
	XSCF> setsnmpusm create -a SHA bob		
	Enter the user authentication passphrase:		
	Enter the user encryption passphrase:		
	EXAMPLE 3 Create a clone of the user.		
	XSCF> setsnmpusm clone -u sue joe		
	EXAMPLE 4 Delete a user.		
	XSCF> setsnmpusm delete joe		

setsnmpusm(8)

EXIT STATUS	The following exit values are returned.	
	0	Indicates normal end.
	>0	Indicates error occurrence.

	setsnmpvacm createaccess -r read_viewname groupname			
	setsnmpvacm deleteaccess groupname			
	setsnmpvacm -h	1		
DESCRIPTION	setsnmpvacm is a command to set the VACM of the SNMP agent.			
	To execute this c	ommand, the basic	knowledge	of SNMP is required.
Privileges	To execute this command, platadm privilege is required.			
	For details on us	er privileges, see se	etprivile	ges(8).
OPTIONS	The following options are supported.			
	-h	Displays the usag or operand causes		ng this option with another option
OPERANDS	The following op	perands are support	ed.	
	createaccess	ss Sets access to the MIB view of the specified group.		
		-r read_viewname groupname		Specifies the SNMP agent view. Specifies a valid group name.
	creategroup	Sets up the view a	ccess of the	e group of the specified user.
		-u username groupname	1	a valid user name. a valid group name.

	createview	Sets up the view of the exported MIB information regarding the SNMP agent. The view access to this agent is read only. The view is identified by the MIB OID subtree and you can limit a specific part of the subtree using the OID mask.	
		-е	Specifies the view to be excluded. The default is the view to be included.
		-m OID_Mask	Specifies a valid OID subtree mask. By default, the mask is ff (entire subtree).
		-s OID_subtree	Specifies the MIB OID subtree. In the entire MIB tree, the value begins with .1.
		viewname	Specifies a valid view name.
	deleteaccess	Deletes the access	entry.
		groupname	Specifies a valid group name.
	deletegroup	Deletes a group.	
		-u username	Specifies a valid user name.
		groupname	Specifies a valid group name.
	deleteview	Deletes a view.	
		-s OID_subtree	Specifies the MIB OID subtree. In the entire MIB tree, the value begins with .1.
		viewname	Specifies a valid view name.
EXTENDED DESCRIPTION	More groups, views or accesses cannot be registered when the total number of characters in the entries, which are registered by executing the following three commands, exceed 8000.		
	 Registered tra 	p hosts by setsnm	p(8)
	 Registered users by setsnmpusm(8) 		
	 Registered groups, views and accesses by setsnmpvacm(8) 		
		IP agent setting info and showsnmpvac	prmation can be confirmed by $showsnmp(8)$, $cm(8)$.
EXAMPLES	EXAMPLE 1 Creat	te a group of view ac	cess.
	XSCF> setsnm	ovacm creategrou	p -u jsmith admin
	EXAMPLE 2 Creat	te a view of the entire	e MIB.
	XSCF> setsnmr	ovacm createview	-s .1 all_view

	EXAMPLE 3 Create a view excluding the subtree.
	XSCF> setsnmpvacm createview -e -s .1.3.6.1.2.1.1 -m fe excl_view
	EXAMPLE 4 Create access to the MIB view.
	XSCF> setsnmpvacm createaccess -r all admin
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	showsnmpvacm (8)

setsnmpvacm(8)

NAME	setsscp - Assigns the IP address of the SP to SP communication protocol (SSCP).		
SYNOPSIS	setsscp		
	<pre>setsscp [-x xbbox_num][-n bb_num] -i address [[-m netmask] -N network_id]</pre>		
	setsscp -b bb_id -i address -N network_id		
	setsscp -c default		
	setsscp -r -b bb_id [-N network_id]		
	setsscp -h		
DESCRIPTION	setsscp is a command to assign an IP address to an SSCP link.		
	setsscp is designed to be used only for the purpose of the initial setting. When executing this command, do not turn on the power of the physical partition (PPAR).		
	For SPARC M12-2S/M10-4S (without crossbar boxes), there are three networks of SSCP links as shown in the following.		
	 Network between BB#00 and each SPARC M12-2S/M10-4S chassis (Network ID 0) 		
	 Network between BB#01 and each SPARC M12-2S/M10-4S chassis (Network ID 1) 		
	■ Network between BB#00 and BB#01 (Network ID 2)		
	For SPARC M12-2S/M10-4S (with crossbar boxes), there are five networks as shown in the following.		
	 Network between XBBOX#80 and each SPARC M12-2S/M10-4S chassis (Network ID 0) 		
	 Network between XBBOX#81 and each SPARC M12-2S/M10-4S chassis (Network ID 1) 		
	 Network between XBBOX#80 and each crossbar box (Network ID 2) 		
	 Network between XBBOX#81 and each crossbar box (Network ID 3) 		
	 Network between XBBOX#80 and XBBOX#81 (Network ID 4) 		
	Note – To use the specified IP address after changing the IP address of SSCP after using setsscp, it is necessary to execute applynetwork(8) and rebootxscf(8). For other than SPARC M12-1/M12-2/M10-1/M10-4, it is also necessary to set the IP address of the SSCP link for the crossbar box or SPARC M12-2S/M10-4S composing the system.		
	setsscp cannot be used for SPARC M12-1/M12-2/M10-1/M10-4.		
Privileges	To execute this command, platadm or fieldeng privilege is required.		

setsscp(8)

	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-ъ bb_id	Specifies the target BB-ID. For SPARC M12-2S/M10-4S (without crossbar boxes), you can specify an integer from 0 to 3. For SPARC M12-2S/M10-4S (with crossbar boxes), you can specify an integer from 0 to 15 as SPARC M12-2S/M10-4S, and 80 to 83 as crossbar box, respectively. It is specified by combination of the -i <i>address</i> and -N options or with the -r option.	
	-c default	Restores the entire SSCP links to the default.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i address	Specifies the IP address by dotted decimal notation of IPv4. Specifies four sets of integers from 0 to 255 placing periods (.) between them. However, Class D and E address (224.0.0.0 to 255.255.255.255) cannot be specified. The integer can be specified using zero suppression.	
		 To specify this with the -m <i>netmask</i>, specify the network addresses of all SSCP links in the system. 	
		To specify this with -b <i>bb_id</i> , specify the IP addresses unique to individual SPARC M12-2S/M10-4S or crossbar boxes in each network used in SSCP.	

-m <i>netmask</i>	Specifies the netmask addresses of all SSCP links in the system. It is specified with the $-i$ <i>address</i> and $-N$ options.
	Specifies four sets of integers from 0 to 255 for netmask placing periods (.) between them. The integer can be specified using zero suppression.
	If omitted, the following netmasks are set.
	■ For SPARC M12-2S/M10-4S (without crossbar box)
	■ If the network ID specified by –N is 0 or 1
	A netmask value of 255.255.255.248 is set.
	■ If the network ID specified by –N is 2
	A netmask value of 255.255.255.252 is set.
	 For SPARC M12-2S/M10-4S (with crossbar box)
	■ If the network ID specified by ¬N is 0 or 1
	A netmask value of 255.255.255.224 is set.
	■ If the network ID specified by –N is 2 or 3
	A netmask value of 255.255.255.248 is set.
	■ If the network ID specified by –ℕ is 4
	A netmask value of 255.255.255.252 is set.
	If $-N$ is not specified, the specified netmask is automatically divided by the above-mentioned netmasks and assigned to each network in order.
-n bb_num	Specifies the number of SPARC M12-2S/M10-4S to be set. SPARC M12-2S/M10-4S (without crossbar box), you can specify a figure from 1 to 4. If not specified, the maximum value which can be specified is specified. For SPARC M12-2S/M10-4S (with crossbar box), you can specify a figure from 1 to 16. If not specified, 16 is specified.
–N network_id	Specifies the ID of the SSCP link network subject to setting. For <i>network_id</i> , specify a figure from 0 to 2 and 0 to 4 in the case of SPARC M12-2S/M10-4S (without crossbar box) and SPARC M12-2S/M10-4S (with crossbar box), respectively. If omitted, all networks are specified. If the -b option is specified without the -r option, it cannot be omitted.
-r	It is used with $-b bb_id$, and deletes the IP address of the specified SPARC M12-2S/M10-4S or crossbar box.

	-x xbbox_num	Specifies the number of crossbar boxes to be set. This cannot be specified for SPARC M12-2S/M10-4S (without crossbar box). For SPARC M12-2S/M10-4S (with crossbar box), you can specify 1, 2, or 4. If not specified, the maximum value which can be specified is specified.	
EXTENDED DESCRIPTION	 If setsscp has never been executed, the default value is set as the IP address the SSCP link. The default values are below. For SPARC M12-2S/M10-4S (without crossbar box) Network ID 0 (netmask: 255.255.248) 		
	BB#00	169.254.1.1	
	BB#01	169.254.1.2	
	BB#02	169.254.1.3	
	BB#03	169.254.1.4	
	- Network	ID 1 (netmask: 255.255.255.248)	
	BB#00	169.254.1.9	
	BB#01	169.254.1.10	
	BB#02	169.254.1.11	
	BB#03	169.254.1.12	
	- Network ID 2 (netmask: 255.255.255.252)		
	BB#00	169.254.1.17	
	BB#01	169.254.1.18	
	 For SPARC M12-2S/M10-4S (with crossbar box) 		
	- Network	ID 0 (netmask: 255.255.255.224)	
	XBBOX#	80 169.254.1.1	
	BB#00	169.254.1.2	
	:		
	BB#14	169.254.1.16	
	BB#15	169.254.1.17	

I

- Network ID 1 (netmask: 255.255.255.224)

XBBOX#81	169.254.1.33
BB#00	169.254.1.34
:	
BB#14	169.254.1.48
BB#15	169.254.1.49

- Network ID 2 (netmask: 255.255.258)

XBBOX#80	169.254.1.65
XBBOX#81	169.254.1.66
XBBOX#82	169.254.1.67
XBBOX#83	169.254.1.68

- Network ID 3 (netmask: 255.255.255.248)

XBBOX#80	169.254.1.73
XBBOX#81	169.254.1.74
XBBOX#82	169.254.1.75
XBBOX#83	169.254.1.76

- Network ID 4 (netmask: 255.255.255.252)

XBBOX#80	169.254.1.81
XBBOX#81	169.254.1.82

- Executing setsscp with nothing specified starts the interactive mode and displays the prompt to enter the IP addresses of SSCPs in order.
- If SSCP has been set in the past, the current setting is displayed. If the displayed setting is appropriate, you can use it by pressing [Enter] key.
- The network address to be used for all SSCP links can be set by using the -i *address* and -m *netmask*. In this operation mode, the IP addresses used in each SSCP link unique to the crossbar box and SPARC M12-2S/M10-4S are automatically selected from the address range indicated by the network address. Assignment is performed in order from XBBOX#80. Collectively setting the

network addresses used for all SSCP links requires a netmask which can retain a host part equivalent to or larger than 255.255.255.224 and 255.255.255.128 for SPARC M12-2S/M10-4S (without and with crossbar boxes, respectively).

 For SPARC M12-2S/M10-4S (without crossbar box), up to 10 IP addresses in the following configuration are used as the address space of all SSCP link networks.

Network ID	Number of IPs required for the maximum configuration	Netmask required for the maximum configuration
0	4	255.255.255.248
1	4	255.255.255.248
2	2	255.255.255.252

For SPARC M12-2S/M10-4S (with crossbar box), up to 44 IP addresses in the following configuration are used.

Network ID	Number of IPs required for the maximum configuration	Netmask required for the maximum configuration
0	17	255.255.255.224
1	17	255.255.255.224
2	4	255.255.255.248
3	4	255.255.255.248
4	2	255.255.255.252

- To set the IP addresses of the links unique to individual crossbar boxes and SPARC M12-2S/M10-4S separately from all of the other SSCP address setting values, use the -b *bb_id*, -N *network_id*, and -i *address*.
- To change the setting value of netmask, it is necessary to execute the interactive mode or collective setting.
- If a value out of the range of network addresses set in advance is used for an SSCP link unique to a crossbar box or SPARC M12-2S/M10-4S, an error occurs.
- To add the crossbar boxes or SPARC M12-2S/M10-4S, it is necessary to assign the IP address of the SSCP link before executing addfru(8).
- If the assigned IP address overlaps with the IP address of another SSCP link, it causes an error of applynetwork(8).
- When deleting the IP address of the SSCP link of a crossbar box or SPARC M12-2S/M10-4S installed in the system, executing applynetwork(8) causes an error. applynetwork(8) determines whether the crossbar box or SPARC M12-2S/M10-4S to be deleted is included in the system.
- Setting a loopback address (127.0.0.0/8), broadcast address, or Class D or E address (224.0.0.0 to 255.255.255.25) in *address* causes an error.

- If the netmask value specified by -m addr does not match either of the following, it causes an error.
 - Only the most significant bit is 1.
 - 1 is placed in a row from the most significant bit.
- If the subnets of the SSCP network and another network overlap, the conditions in which executing applynetwork(8) causes an error are below.
 - Case that some of xbbox#80-lan#0, xbbox#80-lan#1, and the SSCP link have the same subnet
 - Case that some of xbbox#81-lan#0, xbbox#81-lan#1, and the SSCP link have the same subnet
 - Case that some of xbbox#80-lan#0, xbbox#81-lan#1, and the SSCP link have the same subnet
 - Case that some of xbbox#81-lan#0, xbbox#80-lan#1, and the SSCP link have the same subnet
 - Case that some of bb#00-lan#0, bb#00-lan#1, and the SSCP link have the same subnet
 - Case that some of bb#01-lan#0, bb#01-lan#1, and the SSCP link have the same subnet
 - Case that some of bb#00-lan#0, bb#01-lan#1, and the SSCP link have the same subnet
 - Case that some of bb#01-lan#0, bb#00-lan#1, and the SSCP link have the same subnet
- If the subnets of the IP address to be the destination of the routing information and subnet of the SSCP link are overlapping, executing applynetwork(8) causes an error.
- If the number of SPARC M12-2S/M10-4S or crossbar boxes under the maximum configuration quantity is set in the interactive mode, the IP addresses of the SPARC M12-2S/M10-4S or crossbar boxes not set, which have been set in the past, are deleted.
- If the number of SPARC M12-2S/M10-4S or crossbar boxes under the maximum configuration quantity is set by collective setting, the IP addresses of the SPARC M12-2S/M10-4S or crossbar boxes not set, which have been set in the past, are deleted.

However, if the ID of the SSCP link network is also specified, only the IP addresses of the SPARC M12-2S/M10-4S or crossbar boxes of the corresponding SSCP link network, which have been set in the past, are deleted.

■ When specifying -N *network_id*, -b *bb_id*, and -n *bb_num*, -x *xbbox_num* must be within the following range and otherwise it causes an error.

–N network_id	-b bb_id range	-n bb_num range	-x xbbox_num range
0	0 to 3	1 to 4	This cannot be specified.
1	0 to 3	1 to 4	This cannot be specified.
2	0 to 1	1 to 2	This cannot be specified.
For SPARC N	M12-2S/M10-4S	(with crossbar box)	
–N network_id	-b bb_id range	-n bb_num range	-x xbbox_num range
0	0 to 15, 80	1 to 16	1
1	0 to 15, 81	1 to 16	1
1 2	0 to 15, 81 80 to 83	1 to 16 This cannot be specified.	1 2,4
	,		_

For SPARC M12-2S/M10-4S (without crossbar box)

EXAMPLES

Note – The IP addresses shown in the following examples are samples. To specify the IP address of SSCP, specify an IP address not used on the Local Area Network (LAN). For details on the IP address of SSCP, see *Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide*.

EXAMPLE 1 Set the SSCP link using the interactive mode in a configuration composed of eight SPARC M10-4Ss.

XSCF> setsscp

NAME	setssh - Sets Secure Shell (SSH) service used in the XSCF network.		
SYNOPSIS	setssh [[-q]-{y n}] -c {enable disable}		
	setssh -c addpubkey [-u user_name]		
	setssh -c delpubkey {-a -s line} [-u user_name]		
	setssh [[-q]-{y n}]-c genhostkey[-b <i>bits</i>]		
	setssh –h		
DESCRIPTION	setssh is a command to set SSH service used in the XSCF network.		
	In XSCF, only SSH2 is supported. In multi-XSCF configuration, the settings are automatically reflected in the standby XSCFs.		
	The following contents can be set.		
	 Start or halt of SSH service (default is "halt") 		
	 Generation of the host keys required for the SSH service 		
	You can specify either of 2048 bits or 4096 bits. The size of the DSA host key is fixed to 4096 bits.		
	 Registration of the user public key 		
	The user public key can be registered for each user account. It is also allowed to register multiple user public keys for one user account. The maximum number of characters per user account including line feeds available for registration of user public keys is 8191.		
Privileges	To execute this command, any of the following privileges is required.		
	 Start or halt of SSH service and generation of the host key: platadm 		
	 Registration or deletion of user public keys of other user accounts: useradm 		
	 Registration or deletion of user public keys of user accounts which are currently logging in: No privileges are required. 		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a Deletes all of the registered user public keys. It is specified with -c delpubkey.		

	-ь bits	Specifies the size of the host key to be created. For <i>bits</i> , you can specify 2048 or 4096. If omitted, it is recognized as 2048 bits.		
	-c addpubkey	Registers user public keys.		
	-c delpubkey	Deletes user public keys. Generates the host key. Specifies the operation for SSH service. You can specify any of the following. Default is disable.		
	-c genhostkey			
	-c {enable disable}			
		enable disable	Starts SSH service. Halts SSH service.	
	-h	Displays the usage option or operand	e. Specifying this option with another causes an error.	
	-n	Automatically resp	oonds to prompt with "n" (no).	
	-ā	Prevents display of standard output.	f messages, including prompt, for	
	-s line	the number display	bublic key number to be deleted. In <i>line,</i> yed when executing showssh -c d. It is specified with -c delpubkey.	
	-u user_name	Specifies the user account name to register or delete a public keys. It is specified with -c addpubkey or -c delpubkey. If the -u option is omitted, the user pub keys of the user account logging in currently are the targets.		
	-у	Automatically resp	oonds to prompt with "y" (yes).	
EXTENDED DESCRIPTION	 When you execute the command, a prompt to confirm whether to execute i the specified contents is displayed. To execute, press the [y] key. To cancel, the [n] key. Start of SSH service is reflected just after executing setssh and the service started. Halt of SSH service is reflected just after executing setssh. If any, the SSH 		ecute, press the [y] key. To cancel, press executing setssh and the service is executing setssh. If any, the SSH	
			e service are disconnected.	
		SSH of XSCF not by	rs cannot register user public keys. authentication with the user public key	
			ot to confirm whether to execute it with ecute, enter "y." To cancel, enter "n."	

- If a host key is generated when another one has already been generated, a prompt to ask whether to update it is displayed. To update, enter "y." To cancel, enter "n."
- setssh can register just one user public key at a time.
- Input of the user public key when executing setssh is finished by pressing [Enter] key and then [Ctrl] + [D] key (EOF).
- If the system has two or more XSCF units, the settings are automatically reflected in the standby XSCFs. A failure of the standby XSCFs causes an error and then the settings are reflected only in the active XSCF.
- You can confirm the contents of SSH service set currently by using showssh(8).

EXAMPLES EXAMPLE 1 Start SSH service.

```
XSCF> setssh -c enable
Continue? [y | n] :y
```

EXAMPLE 2 Start SSH service. The prompt is automatically given a "y" response.

```
XSCF> setssh -y -c enable
Continue? [y|n] :y
```

EXAMPLE 3 Start SSH service. The message is hidden and the prompt is automatically given a "y" response.

XSCF> setssh -q -y -c enable

EXAMPLE 4 Halt SSH service.

```
XSCF> setssh -c disable
Continue? [y|n] :y
```

EXAMPLE 5 Generate the host key.

```
XSCF> setssh -c genhostkey
Host key create. Continue? [y|n] :y
```

EXAMPLE 6 Generate the host key. The prompt is automatically given a "y" response.

```
XSCF> setssh -c genhostkey -y
Host key create. Continue? [y|n] :y
```

EXAMPLE 7 Generate the host key. The confirmation message is hidden and the prompt is automatically given a "y" response.

```
XSCF> setssh -c genhostkey -q -y
```

```
EXAMPLE 8 Generate the host key of 4096 bits.
                   XSCF> setssh -c genhostkey -b 4096
                   Host key create. Continue? [y|n] :y
                             Register user public keys. Input of the public key is finished by pressing [En-
                 EXAMPLE 9
                             ter] key and then [Ctrl] + [D] key (EOF).
                   XSCF> setssh -c addpubkey
                   Please input a public key:
                   ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAzFh95SohrDgpnN7zFCJCVNy+jaZPTjNDxcid

                   FeV44hefNCZMiXGItIIpK
                   P0nBK4XJpCFoFbPXNUHDw1rTD9icD5U/wRFGSRRxFI+Ub5oLRxN8+A8=
                   abcd@example.com
                   [Enter]
                   [Ctr1]+[D]
                 EXAMPLE 10 Register a user public key specifying the user name. Input of the public key is
                             finished by pressing [Enter] key and then [Ctrl] + [D] key (EOF).
                   XSCF> setssh -c addpubkey -u efgh
                   Please input a public key:
                   ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAzFh95SohrDgpnN7zFCJCVNy+jaZPTjNDxcid
                   QGbihYDCBttI4151Y0Sv85FJwDpSNHNKoVLMYLjtBmUMPbGgGVB61qskSv/
                   FeV44hefNCZMiXGItIIpK
                   P0nBK4XJpCFoFbPXNUHDw1rTD9icD5U/wRFGSRRxFI+Ub5oLRxN8+A8=
                   efgh@example.com
                   [Enter]
                   [Ctr1]+[D]
                 EXAMPLE 11 Delete a user public key specifying the public key number.
                   XSCF> setssh -c delpubkey -s 1
                    1 ssh-rsa
                   AAAAB3NzaC1yc2EAAAABIwAAAIEAzFh95SohrDgpnN7zFCJCVNy+jaZPTjNDxcid
                   QGbihYDCBttI4151Y0Sv85FJwDpSNHNKoVLMYLjtBmUMPbGgGVB61qskSv/
                   FeV44hefNCZMiXGItIIpK
                   P0nBK4XJpCFoFbPXNUHDw1rTD9icD5U/wRFGSRRxFI+Ub5oLRxN8+A8=
                   abcd@example.com
                 EXAMPLE 12 Delete all user public keys.
                   XSCF> setssh -c delpubkev -a
EXIT STATUS
                 The following exit values are returned.
                                   Indicates normal end.
                 0
                 >0
                                   Indicates error occurrence.

NAME	settelnet - Starts or halts Telnet service used in the XSCF network.				
SYNOPSIS	<pre>settelnet [[-q] - {y n}] -c {enable disable}</pre>				
	settelnet -h				
DESCRIPTION	settelnet is a command to start or halt Telnet service used in the XSCF network. The Telnet service is halted by default.				
	In multi-XSCF configuration, the settings are automatically reflected in the standby XSCFs.				
Privileges	To execute this comman	d, platadm privile	ge is required.		
	For details on user privi	ileges, see setpriv	vileges(8).		
OPTIONS	The following options a	re supported.			
	-c{enable disable}	enable disable} Specifies whether to start or halt Telnet service. You can specify either of the following. Default is disable.			
		enable disable	Starts Telnet service. Halts Telnet service.		
	-h	Displays the usag option or operand	e. Specifying this option with another l causes an error.		
	-n	Automatically res	ponds to prompt with "n" (no).		
	-d	q Prevents display of messages, including prompt, for standard output.			
EXTENDED	 When Telnet service is enabled, Telnet service is started immediately. 				
 DESCRIPTION Halt of Telnet service is reflected just at the Telnet sessions in operation are dis 					
	 You can confirm the contents of Telnet service set currently by using showtelnet(8). 				
EXAMPLES	EXAMPLE 1 Start Telnet service.				
	XSCF> settelnet -c enable Continue? [y n] : y				
	EXAMPLE 2 Halt Telnet s	ervice.			
	XSCF> settelnet -c disable Continue? [y n] : y				

	EXAMPLE 3 Halt	Telnet service. The prompt is automatically given a "y" response.
		net -y -c disable
EXIT STATUS	The following ex	kit values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	settimezone - Sets the time zone and daylight saving time of XSCF.			
SYNOPSIS	settimezone -c settz -s timezone			
	settimezone -c settz -a [-M]			
	settimezone -c a [/time]	adddst -b std -o offset -d dst [-p offset] -f date[/time] -t date		
	settimezone –c o	deldst -b std -o offset		
	settimezone -h			
DESCRIPTION	settimezone is	a command to set the time zone and daylight saving time of XSCF.		
	The time zone pr	repared as standard complies with the POSIX standard.		
	The default value	e of XSCF timezone is UTC (Coordinate Universal Time).		
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-a	Displays the list of the settable time zones. It is specified with $-c$ settz.		
	-b std	Specifies the abbreviation of the standard time of the time zone. <i>std</i> is specified in alphabet from 3 to 7 characters. This can be specified in a format compliant with RFC2822. It is specified with $-c$ adddst or $-c$ deldst.		
	-c adddst	Manually sets the time zone and daylight saving time. The daylight saving time is set based on the time zone information specified by the $-b$, $-o$, $-d$, $-p$, $-f$, and $-t$ options. If the daylight saving time is set manually, the time zone information set by $-c$ settz is ignored. Logging in XSCF again after executing settimezone reflects the contents of the settings.		
	-c deldst	Deletes the time zone and daylight saving time set manually. If the daylight saving time set manually is deleted, XSCF comes to operate in the time zone set by -c settz. Logging in XSCF again after executing settimezone reflects the contents of the settings.		
	-c settz	Sets a time zone compliant with the POSIX standard. The time zone is reflected just after executing settimezone.		

-d dst	Specifies the daylight saving time zone name. <i>dst</i> is specified in alphabet from 3 to 7 characters. This can be specified in a format compliant with RFC2822. It is specified with -c_adddst.			
-£ date [/time]	Specifies the start time of the daylight saving time. It is specified with -c adddst. It is specified in the same format as that of <i>date</i> of -t option. <i>date</i> can be specified in any of the following formats.			
	Jn			
	J <i>n</i> : Specifies the date to start the daylight saving time. You can specify a figure from 1 to 365 with January 1 regarded as 1 for <i>n</i> . In leap years, February 29 is not counted. 365 indicates December 31 even in leap years.			
	 Mm.w.d Mm: Specifies the month to start the daylight saving time. Yo can specify a figure from 1 to 12 for m w: Specifies the week to start the daylight saving time. 1 indicates the first week and 5 indicates the last week. You can specify a figure from 1 to 5. d: Specifies the day of the week to start the daylight saving time. 0 indicates Sunday and 6 indicates Saturday. You can specify a figure from 0 to 6. 			
	<i>n</i> <i>n</i> : Specifies the date to start the daylight saving time. You can specify a figure from 1 to 365 with January 2 regarded as 1. In leap years, February 29 is counted.			
	Specifies the time for <i>time</i> . This can be specified using the following format.			
	hh:mm:ss	This is specified in the format of "hh:mm:ss." <i>hh</i> is from 0 to 23. <i>mm</i> is 0 to 59. ss is 0 to 59. If omitted, it is 02:00:00.		
-h	Displays the usage or operand causes	. Specifying this option with another option an error.		
-M	Displays text one s	creen at a time.		

−0 offset	Specifies the offset between the time zone and Greenwich Mean Time (GMT). It is specified with -c adddst or -c deldst. <i>offset</i> can be specified using the following format.			
	$GMT\{+ -\}hh[:mm[:ss]]$			
	GMT {+ -} <i>hh</i> [: <i>mm</i> [: <i>ss</i>]]	Greenwich Mean Time To set a standard time earlier than GMT, specify (To set a local time on the east of Greenwich, the value of offset shall be - (minus).) To set a standard time later than GMT, specify +. (To set a local time on the west of Greenwich, the value of offset shall be + (plus).) Specifies the offset time. <i>hh</i> is from 0 to 23. <i>mm</i> and <i>ss</i> are from 0 to 59.		
-p offset	Specifies the offset between the daylight saving time and Greenwich Mean Time (GMT). It is specified with $-c$ add omitted, it becomes one hour earlier than the offset time specified by $-o$ option. <i>offset</i> can be specified using the foll format.			
	$GMT\{+ -\}hh[:mm[$:ss]]		
	GMT {+ -}	Greenwich Mean Time To set a standard time earlier than GMT, specify (To set a local time on the east of Greenwich, the value of offset shall be - (minus).) To set a standard time later than GMT, specify +. (To set a local time on the west of Greenwich, the value of offset shall be + (plus).)		
	hh[:mm[:ss]]	Specifies the offset time. <i>hh</i> is from 0 to 23. <i>mm</i> and <i>ss</i> are from 0 to 59.		
-s timezone		e zone. It is specified with -c settz. For specify any of the time zones displayed by the		

	-t date [/time]	specified with -t	to finish the daylight saving time. It is adddst. It is specified in the same format as option. <i>date</i> can be specified in any of the
		Jn	
		can specify a fig 1 for <i>n</i> . In leap	e date to finish the daylight saving time. You gure from 1 to 365 with January 1 regarded as years, February 29 is not counted. 365 nber 31 even in leap years.
		You can specify w: Specifies the indicates the fir specify a figure d: Specifies the	day of the week to finish the daylight saving s Sunday and 6 indicates Saturday. You can
		can specify a fig	date to finish the daylight saving time. You gure from 1 to 365 with January 2 regarded as February 29 is counted.
		Specifies the time following format.	for <i>time</i> . This can be specified using the
		hh:mm:ss	This is specified in the format of "hh:mm:ss." <i>hh</i> is from 0 to 23. <i>mm</i> is 0 to 59. <i>ss</i> is 0 to 60. If omitted, it is 02:00:00.
EXTENDED DESCRIPTION	saving time. To		mber of years for the time zone or daylight nt saving time every year, it is necessary to
	 If the daylight 	saving time is not se	et, it is not affected by the time zone.
	 To set the dayl same format. 		-c adddst, specify the start and end in the
	 When setting t an error. 	he daylight saving	time by -c adddst, the following cases cause
	 Case that th n format 	e period between th	e start and end is shorter than 14 days in Jn or
		e start and end is ir eeks in the Mm.w.d	n the same month and the period is shorter format

	 Case that an offset smaller than -p offset is specified in -o offset 			
	■ Case that the difference in the offsets of -o <i>offset</i> and -p <i>offset</i> is longer than 2.	4		
	hours			
	 If the standard time set by settimezone is added to the offset time, it become GMT. 	s		
	• You can confirm the time zone set currently by using showtimezone(8).			
	 To reflect the daylight saving time information changed by the -c adddst and -c deldst options, logout from XSCF and login again. 			
EXAMPLES	EXAMPLE 1 Set the time zone to "Asia/Tokyo."			
	XSCF> settimezone -c settz -s Asia/Tokyo Asia/Tokyo			
	EXAMPLE 2 Display the list of the settable time zones.			
	XSCF> settimezone -c settz -a			
	Africa/Abidjan Africa/Accra			
	Africa/Addis_Ababa			
	Africa/Algiers Africa/Asmara			
	Africa/Asmara Africa/Asmera			
	Africa/Bamako Africa/Bangui			
	· ·			
	EXAMPLE 3 Set the daylight saving time information with setting the time zone abbreviation to JST, offset from GMT to +9, daylight saving time zone name to JDT, daylight saving time to one hour earlier, and period to 2:00 on the last Sunda of March (JST) to 2:00 on the last Sunday of October (JDT).			
	of Waler (jor) to 2.00 of the last building of belober (jbr).			
	XSCF> settimezone -c adddst -b JST -o GMT-9 -d JDT -f M3.5.0 -t M10.5.0			
	JST-9JDT,M3.5.0,M10.5.0			
	EXAMPLE 4 Set the daylight saving time information with setting the time zone abbreviation to JST, offset from GMT to +9, daylight saving time zone name to JDT, offset from the daylight saving time of GMT to +10 hours, and period to 0:0 on the first Sunday of April (JST) to 0:00 on the first Sunday of September (JDT).			
	XSCF> settimezone -c adddst -b JST -o GMT-9 -d JDT -p GMT-10 -f M4.1.0/00:00:00 -t M9.1.0/00:00:00 JST-9JDT-10,M4.1.0/00:00:00,M9.1.0/00:00:00			

settimezone(8)

	EXAMPLE 5 Delete the daylight saving time information set currently.
	XSCF> settimezone -c deldst -b JST -o GMT-9
EVIT CTATUS	The following wit values are returned
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	setupfru - Sets the hardware of devices.			
SYNOPSIS	setupfru [[-q] - {y n}] -c function= mode device location			
	setupfru [-m {y n	}] device loc	cation	
	setupfru –h			
DESCRIPTION	setupfru is a com	nmand to s	et the hardware of the specified device.	
	You can specify a p	physical sys	stem board (PSB) as the device.	
	The following conte addition.	ents can be	set for PSB to make PSB available for the system after	
	Memory mirror mo	ode Sets	whether to mirror the memory.	
			u mirror the memory, the memory size under CPUs mes half but the reliability of data is improved.	
			rder to set to memory mirror mode, the target PSB Id be in either of the following two states:	
		■ N	ot configured to a physical partition (PPAR).	
		■ A	PPAR configuring the PSB is not powered on.	
Privileges	To execute this com	nmand, pl	atadm or fieldeng privilege is required.	
	For details on user	privileges	see setprivileges(8).	
OPTIONS	The following options are supported.			
		of the follo reflected in	the target for settings in <i>function</i> . You can specify any wing. If sb is specified in <i>device</i> , the setting is all CPU chips under the specified PSB. If cpu is a <i>device</i> , the setting is reflected only in the specified	
	-	This optior	n is available only for SPARC M12-1/M12-2/M12-2S.	
	I	mirror	Specifies whether to set up memory mirror mode. You can specify either of the following in <i>mode</i> . The default value is "no". yes: Set memory mirror mode. no: Clear memory mirror mode.	
			e usage. Specifying this option with another option causes an error.	
ļ				

setupfru(8)

	-m {y n}	Specify whether to set up memory mirror mode for memory under CPUs. If memory mirror mode is to be set up, specify y, otherwise, specify n. If the -m option is omitted, the previous setting is taken over.		
		If sb is specified in <i>device</i> , the setting is reflected in all CPUs under the specified PSB. If cpu is specified in <i>device</i> , the setting is reflected only in the specified CPUs.		
	-n	Automatically responds to prompts with "n" (no).		
		This option is available only for SPARC M12-1/M12-2/M12-2S		
	-đ	Prevents display of messages, including prompts, for standard output.This option is available only for SPARC M12-1/M12-2/M12-2SAutomatically responds to prompts with "y" (yes).		
	-у			
		This option is available only for SPARC M12-1/M12-2/M12-2S.		
OPERANDS	The following o	perands are supported.		
	device	Specifies the device to be set. You can specify either of the following.		
		sb PSB		
		cpu CPU in PSB		
	location	Specifies the location where the device is mounted.		
		sb is specified in the following format.		
		xx-y xx Specifies the BB-ID which is an integer from 00 to 15. y It is fixed to 0.		
		cpu is specified in the following format.		
		 xx-y-z xx Specifies the BB-ID which is an integer from 00 to 15. y It is fixed to 0. z Specify the CPU chip number. For SPARC M12-1/M10-1, specify 0. For SPARC M10-4/M10-4S, specify an integer from 0 to 3. For SPARC M12-2/M12-2S, specify 0 or 2. 		

l

EXTENDED DESCRIPTION	You can confirm the contents regarding the hardware of the devices set currently by using showfru(8).			
EXAMPLES	EXAMPLE 1 Set all CPUs under PSB 01-0 to the memory mirror mode.			
	XSCF> setupfru -m y sb 01-0			
	EXAMPLE 2 Set the CPU of PSB 02-0 CPU chip 1 to the memory mirror mode.			
	XSCF> setupfru -m y cpu 02-0-1			
	EXAMPLE 3 Set all CPUs under PSB 01-0 to the memory mirror mode on SPARC M12-2S.			
	XSCF> setupfru -c mirror=yes sb 01-0			
	Notice: - Logical domain config_name will be set to "factory-default".			
	Memory mirror mode setting will be changed, Continue? [y n] $: \mathbf{y}$			
EXIT STATUS	The following exit values are returned.			
	0 Indicates normal end.			
	>0 Indicates error occurrence.

setupfru(8)

NAME	setvbootconfig - Configures the Verified Boot policy of Oracle Solaris and enables/ disables X.509 public key certificates used for performing Verified Boot.		
SYNOPSIS	setvbootconfig	-p ppar_id -i index [[-q]-{y n}]-c {enable disable}	
	<pre>setvbootconfig -p ppar_id [[-q] - {y n}] -s policy=value</pre>		
	setvbootconfig	-h	
DESCRIPTION	The setvbootconfig command configures the Verified Boot policy of Oracle Solaris and enables/disables X.509 public key certificates used for performing Verified Boot.		
	added to the ph not the pre-insta	config command can only enable/disable the certificates that are sysical partition (PPAR) by users using the addvbootcerts(8), but alled certificates in the system. Details of the configuration can be an e showvbootconfig(8).	
Privileges	To execute this o	command, either of the following privileges is required.	
	platadm	Enables execution for all PPARs.	
	pparadm	Enables execution for PPARs for which you have administration privilege.	
	For details on u	ser privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-c {enable disable}	Specify enable if using X.509 public key certificates and disable if not.	
	-i index	Specifies the management number of the X.509 public key certificate whose configuration is to be changed. Management numbers from 1 through 5 can be allotted. Management numbers can be confirmed by the showvbootcerts(8).	
	-n	Automatically responds to prompt with "n" (no).	
	-p ppar_id	Specifies the PPAR-ID of the PPAR that is to be changed.	
	-đ	Prevents display of messages, including prompt, for standard output.	

-s policy=value	Sets up Verified Boot policy. <i>policy</i> and <i>value</i> should be specified by separating them with an equal (=) sign. Spaces should not exist at both end of the equal (=) sign.			
	The possible	valu	es for <i>policy</i> are as follows:	
	boot_policy		Sets up the boot verification policy of the unix and genunix modules.	
	module_policy		Sets up the boot verification policy of kernel modules that needs to be loaded after genunix.	
	The possible	value	es for <i>value</i> are as follows:	
	none	Doe	es not execute boot verification (default).	
	warning	Boot verification is performed. Verification is performed before the target of verification is loaded. Even if the verification the target of the verification is loaded and l processing continues. If verification of the boot block and unix fa failure of the verification is recorded in the console. It is not recorded in the system log XSCF error log. If verification of genunix and other kernel modules fails, the failure of the verification recorded in the system console and the syste It is not recorded in the XSCF error log.		
	enforce	Veri veri If veri the log. If veri stop recci in the If veri boo this in the	t verification is performed. ification is performed before the target of the fication is loaded. erification of the boot block and unix fails, boot cessing stops. At this time, the failure of the fication is recorded in the system console and XSCF error log. It is not recorded in the system erification of genunix fails, boot processing bs. At this time, the failure of the verification is orded in the system console. It is not recorded he XSCF error log and the system log. erification of other kernel modules fails, the t continues without loading the module. At time, the failure of the verification is recorded he system console and the system log. It is not orded in the XSCF error log.	

	-у	Automatically responds to prompt with "y" (yes).	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXAMPLES	EXAMPLE 1	Enable the X.509 public key certificate that is registered to the PPAR-ID 0, with management number 1.	
	XSCF> setvbootconfig -p 0 -i 1 -c enable Index 1, CUSTOM_CERT_1 on PPAR-ID 0 will be enabled, Continue?[y n]:		
	EXAMPLE 2	Disable the X.509 public key certificate that is registered to the PPAR-ID 15, with management number 2. Answer "y" to the confirmation message.	
	XSCF> setvbootconfig -p 15 -i 2 -y -c disable Index 2, CUSTOM_CERT_2 on PPAR-ID 15 will be disabled, Continue?[y n]: y		
	EXAMPLE 3	Set the "boot verification policy of the UNIX and genunix modules" of PPAR-ID 2 to "warning".	
	<pre>XSCF> setvbootconfig -p 2 -s boot_policy=warning PPAR-ID 2 policies for Verified Boot will be changed, Continue?[y n]:</pre>		
	EXAMPLE 4	Set the "boot verification policy of other kernel modules which are to be load- ed after genunix" of PPAR-ID 4 to "enforce".	
		etvbootconfig -p 4 -s module_policy=enforce 4 policies for Verified Boot will be changed, ?[y n]:	
EXIT STATUS	The follow	ing exit values are returned.	
	0	Indicates normal end.	
	>0	Indicates error occurrence.

showad -h		
showad displays A	ctive Directory configuration and diagnostic messages.	
You must have use	eradm privileges to run this command.	
Refer to setprivi	leges(8) for more information.	
The following optic	ons are supported:	
u i	Displays diagnostic messages in real time. When this option is used, the command does not terminate. Each diagnostic message s displayed when it is registered. To stop the real-time display, press [Ctrl]+[C] key.	
	Displays usage statement. When used with other options or operands, an error occurs.	
	showad cert [-v] showad log [-M] showad log -f showad group adr showad group ope showad group cus showad group cus showad displays A showad displays A Showad displays A You must have use Refer to setprivi The following optio -f	

	-i n	without an	dex marker, value 1 - 5. When executed without -i or ny value for -i, the system behaves in the following rding to the assigned operand.
			serdomain, dnslocatorquery ssively searches index marker 1 to 5.
		-	ays the server certificate of the primary Active cory server.
		server Displa server	ays the configuration of the primary Active Directory
	-V		verbose output. Used only with the cert operand to e full certificate.
	-C	Appends	to end of output the number of records in the log.
	-E	end_record	he last record number to display, where _ <i>number</i> can be any record number in the log. Use -C the number of records in the log.
	-M	Displays t	ext one screen at a time.
	- S	can be any	he first record to display, where <i>start_record_number</i> y record number in the log. Use -C to obtain the f records in the log.
OPERANDS	The following op	erands are s	supported:
	cert		Display current server certificates.
			Displays the primary Active Directory server when -i is omitted. Displays the alternate Active Directory server when -i is specified.
	log		Display diagnostic messages.
	group adminis	strator	Display current group configurations.
	group operato	or	Display current group configurations.
	group custom		Display current group configurations.
	userdomain		Display current userdomain settings.

showad(8)

dnslocatorquery	Display current DNS locator query configuration.
defaultrole	Display current defaultrole setting.
server	Display current Active Directory server settings.
	Displays the primary Active Directory server when -i is omitted. Displays the alternate Active Directory server when -i is specified.

EXAMPLES

EXAMPLE 1 Displays the current state of the active directory.

XSCF> showad dnslocatormode: disabled expsearchmode: disabled state: enabled strictcertmode: disabled timeout: 4 logdetail: none

EXAMPLE 2 Displays certificate information for the primary Active Directory server.

```
XSCF> showad cert
Primary Server:
```

```
certstatus = certificate present
issuer = C=US, ST=California, L=San Diego, O=aCompany,
OU=System Group, CN=John User serial number = 0 (00000000)
subject = C=US, ST=California, L=San Diego, O=aCompany,
OU=System Group, CN=John User serial number = 0 (00000000)
valid from = Apr 18 05:38:36 2013 GMT
valid until = Apr 16 05:38:36 2023 GMT
version = 3 (0x02)
```

EXAMPLE 3 Displays specified diagnostic messages.

```
XSCF> showad log -S 5 -E 10
```

```
Thu Sep 2 01:43 2013 (ActDir): -error- authentication status: auth-ERROR

NAME	showaltitude - Displays the altitude of the system.		
SYNOPSIS	showaltitude		
	showaltitude -h		
DESCRIPTION	showaltitude is a command to display the altitude of the system set currently		
	If showaltitude is executed without specifying the option, the altitude of the device is displayed. The displayed altitude is the value set by setaltitude(8).		
	The altitude is displayed by 100 meters (m).		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	You can set the altitude of the system by using setaltitude(8).		
EXAMPLES	EXAMPLE 1 Display the altitude of the system.		
	XSCF> showaltitude 1000m		
EXIT STATUS			
EXIT STATUS	1000m		
EXIT STATUS	1000m The following exit values are returned.		
EXIT STATUS SEE ALSO	1000m The following exit values are returned. 0 Indicates normal end.		
	1000m The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.		
	1000m The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.		
	1000m The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.		
	1000m The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.		
	1000m The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.

NAME	showaudit - Displays the current status of the audit system.			
SYNOPSIS	showaudit			
	showaudit [all]			
	showaudit [-a [-t]	users] [-c { classes all}] [-e	e { events all}] [-g] [-m] [-p] [-s]	
	showaudit -h			
DESCRIPTION	executed witho		system audit. If showaudit is lisplayed whether writing of audit	
Privileges	To execute this	command, auditadm or audi	top privilege is required.	
	For details on u	user privileges, see setprivil	.eges(8).	
OPTIONS	The following options are supported.			
	-a users	Displays the audit record ger <i>users</i> is the comma-separated	neration policy of the specified user. list of the valid user names.	
	−c classes	Displays the audit record generation policy of the specified audit class. <i>classes</i> is a comma-separated list of audit classes. Classes can be specified with a number or name. The prefix of ACS_ can be omitted. For example, the classes of audit-related events can be expressed as ACS_AUDIT, AUDIT or 2.		
		The valid classes are below.		
		all	All classes	
		ACS_SYSTEM(1)	System-related event	
		ACS_WRITE(2)	Command that can change the status	
		ACS_READ(4)	Command to display the current status	
		ACS_LOGIN(8)	Login-related event	
		ACS_AUDIT(16)	Audit-related event	
		ACS_PPAR(32)	Physical partition (PPAR) administration-related event	
		ACS_USER(64)	User administration-related event	
		ACS_PLATFORM(128)	Platform administration-related event	
		ACS_MODES(256)	Mode-related event	

showaudit(8)

	-e events	Displays the audit record generation policy of the specified audit events. <i>events</i> is a comma-separated list of audit events. Events can be specified with a number or name. The prefix of AEV_ can be omitted. For example, the event of SSH login can be expressed as AEV_LOGIN_SSH, LOGIN_SSH, or 4.
		For the list of valid events, see showaudit -e all.
	-g	Displays the global audit record generation policy of the user.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-m	Displays the destination address of the e-mail to be sent if the usage of the local audit area reaches the threshold.
	-p	Displays the policy to be followed if the audit trail reaches the full capacity.
	-5	Displays the following audit statuses.
		 Area used by the local audit record
		 Free space left for the local audit record
		 Number of the audit record deleted (after the previous boot) since the audit trail reaches the full capacity
	-t	Displays the threshold to issue a warning for the usage of the local region.
OPERANDS	The following o	operands are supported.
	all	Displays the following information.
		 Whether writing of audit trail is set to enable or disable. This information is the same as that which is displayed when showaudit is executed without specifying any options.
		 All information displayed when showaudit is executed specifying the -a, -c all, -e all, -g, -m, -p, -s, and -t options.
EXAMPLES	EXAMPLE 1 Dis	play the audit status.
	XSCF> showa Auditing: en	udit

I

EXAMPLE 2 Display all class information regarding login audit. XSCF> showaudit -c LOGIN Events: AEV LOGIN BUI enabled AEV_LOGIN_CONSOLE enabled AEV_LOGIN_SSH enabled AEV_LOGIN_TELNET enabled AEV_LOGOUT enabled AEV_AUTHENTICATE enabled **EXAMPLE 3** Display all event information. XSCF> showaudit -e all Events: AEV_AUDIT_START enabled enabled AEV_AUDIT_STOP AEV_ENTER_MODE enabled AEV_EXIT_MODE enabled AEV_LOGIN_BUI enabled AEV_LOGIN_CONSOLE enabled AEV_LOGIN_SSH enabled enabled AEV_LOGIN_TELNET AEV_LOGOUT enabled AEV_AUTHENTICATE enabled AEV_addboard enabled AEV_addfru enabled [...] EXIT STATUS The following exit values are returned. Indicates normal end. 0 >0 Indicates error occurrence. SEE ALSO setaudit(8), viewaudit(8)

showaudit(8)

NAME	showautologout - Displays the session timeout time of the XSCF shell.		
SYNOPSIS	showautologout		
	showautologout -h		
DESCRIPTION	showautologout is a command to display the session timeout time set in the XSCF shell.		
	Displays the session timeout time by minutes. If the session timeout time is not set by setautologout(8), it is set to 10 minutes by default.		
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, auditadm, auditop, pparadm, pparmgr, pparop, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	EXAMPLE 1 Display the session timeout time of the login shell. (If set to 30 minutes)		
	XSCF> showautologout 30min		
	EXAMPLE 2 Display the session timeout time of the login shell. (In the default status)		
	XSCF> showautologout 10min		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	setautologout(8)		

showautologout(8)

NAME	showbbstatus - Display the status of the SPARC M12/M10 systems chassis.		
SYNOPSIS	showbbstatus		
	showbbstatus -h		
DESCRIPTION	showbbstatus is a command to display the status of the currently-operated SPARC M12/M10 systems chassis.		
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng		
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	EXAMPLE 1 Display the SPARC M12/M10 systems status of its own device.		
	XSCF> showbbstatus BB#01 (Standby)		
	EXAMPLE 2 Display the SPARC M12/M10 systems status of its own device (when the master XSCF and the standby XSCF cannot be synchronised).		
	XSCF> showbbstatus BB#00 (Master) Cannot communicate with Standby XSCF. Please check Standby XSCF's state.		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		

showbbstatus(8)

NAME	showboards - Displays the information of the physical system board (PSB).			
SYNOPSIS	showboards [-v] -a [-c sp]			
	showboards [-v] -p ppar_id [-c sp]			
	showboards [-v	7] psb		
	showboards -h			
DESCRIPTION	abowboorda is	command to displ	ay the information of PSB.	
DESCRIPTION		-	as one building block (BB).	
	1 1 1			
	Displays the information of all PSBs currently incorporated into, assigned to, or mounted in the physical partition (PPAR). If PPAR is specified, only the information defined in the PPAR configuration information (PCL) is displayed.			
	The following information is displayed.			
	PSB PSB number			
		This is displayed	in the format below.	
		xx-y:		
		BB-ID which is an integer from 00 to 15		
		у	It is fixed to 0	
	PPAR-ID PPAR-ID			
	Any of the following is displayed.			
		00-15	PPAR-ID to which PSB is assigned	
		SP	PSB does not belong to PPAR and is in the system board pool status	
		Other	This is displayed if the PSB is set in the PCL of a PPAR to which access privilege has been granted, and at the same time, belongs to a PPAR to which no access privilege has been granted.	
	LSB	Logical System Bo	oard (LSB) number defined in PPAR	
		An integer from 0	0 to 15 is displayed.	

Assignment status of PSB to PPAR			
Any of the follow	ing is displayed.		
Unavailable	PSB is in the system board pool status (not assigned to PPAR) and corresponds to any of "Undiagnosed," "Diagnosing," or "Abnormal diagnosis." Unimplemented PSB also becomes Unavailable.		
Available	PSB is in the system board pool status and the diagnosis has been normally completed.		
Assigned	PSB is assigned to PPAR.		
PSB is turned on			
Either of the follow	wing is displayed.		
n	In the power-off status		
У	In the power-on status		
PSB is connected to the PPAR configuration			
Either of the following is displayed.			
n	Not connected to the corresponding PPAR or in the system board pool status		
У	Connected to the corresponding PPAR		
Operating status of	of Oracle Solaris		
Either of the follow	wing is displayed.		
n Y	PSB is not operating in Oracle Solaris. PSB is operating in Oracle Solaris.		
Status of the initia	l diagnosis of PSB		
Any of the following is displayed.			
Unmount	Recognition is impossible because it is not mounted or a failure occurred		
Unknown	Not diagnosed		
Testing	The initial diagnosis is in progress.		
Passed	The initial diagnosis is normally completed.		
Failed	An abnormality occurred in the initial diagnosis. PSB cannot be used or are degraded.		
	Any of the following Unavailable Available Assigned PSB is turned on Either of the following Y PSB is connected of Either of the following N Y Operating status of Either of the following N Y Status of the initian Any of the following Unmount Unknown Testing Passed		

I	Fault	Degradation sta	tus of PSB
	iauit	Any of the following is displayed.	
		-	
		Normal Degraded	Normal status There is a degraded part. PSB can be operated.
		Faulted	PSB cannot be operated due to an abnormality or cannot be controlled due to a communication abnormally.
	If it is specified v detailed status of	-	n, the following information is displayed as the
	R	Dynamic Recon PPAR	figuration (DR) reservation status of PSB for
		*	DR processing is reserved. If PPAR is restarted, the PPAR configuration is changed by incorporation or release of PSB.
		0	less of DR operation, this information is always the PSB is powered off.
Privileges	To execute this co	ommand, any of t	the following privileges is required.
	platadm, plato	p,fieldeng En	ables execution for all PPARs and PSBs.
	pparadm, pparm		ables execution for PPARs for which you have cess privilege.
	For details on use	er privileges, see	setprivileges(8).
OPTIONS	The following op	tions are support	ed.
	-a	Displays the sta or mounted in I	tuses of all PSBs incorporated into, assigned to, PPAR.
	-c sp		B of the system board pool. System board pool s in which PSB does not belong to any PPARs.

showboards(8)

	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
	-p ppar_id	Specifies the PPAR-ID to display the status. Only the information defined in the PCL of the specified PPAR is displayed. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .			
	-v	Displays the detailed information of PSB.			
OPERANDS	The following o	erands are supported.			
	psb	Specifies the PSB number to be displayed. The specification format is below.			
		<i>xx-y</i> <i>xx</i> BB-ID which is an integer from 00 to 15			
		<i>y</i> It is fixed to 0			
EXTENDED DESCRIPTION	 If XSCF is reb 	ecified, only the PSB information defined in PCL is displayed. ooted with the rebootxscf(8) when PPAR is not running, the us is displayed as "Unknown", but if the PPAR is restarted, the to "Passed".			
EXAMPLES	EXAMPLE 1 Disp	lay the information of all PSBs mounted.			
		LSB) Assignment Pwr Conn Conf Test Fault			
	00-0 00(00) 01-0 SP 02-0 Other 03-0 SP	Assigned y y y Passed Normal Unavailable n n n Testing Normal Assigned y y n Passed Degraded Unavailable n n n Failed Faulted

Indicates error occurrence. >0 SEE ALSO addboard (8), deleteboard (8), setpcl (8), setupfru (8), showfru (8), showpcl (8) showboards(8)

NAME	showcod - Shows the registered and setup information of CPU Activations.			
SYNOPSIS	showcod [-v] -s cpu			
	showcod [-v]	-p ppar_i	d	
	showcod [-v][[-M]		
	showcod -h			
DESCRIPTION	showcod is the command to show the registered and setup information of CPU Activations. The registered and setup information of CPU Activations includes the number of CPU Activations that is registered to SPARC M12/M10 systems with addcodactivation(8) and also the number of CPU Activations that is registered to physical partitions (PPAR) with setcod(8).			
	If showcod is existent information of a		rithout specifying -p <i>ppar_id</i> , the CPU Activation is displayed.	
Privileges	To execute this command, any of the following privileges is required.			
	platadm,plat	op	Enables execution for all PPARs.	
	pparadm, ppar pparop	mgr,	Enables execution for PPARs for which you have access privilege.	
	For details on u	ser privile	eges, see setprivileges(8).	
OPTIONS	The following options are supported.			
	-h		ys the usage. Specifying this option with another option rand causes an error.	
	-M	Displa	ys text one screen at a time.	
	-p ppar_id		es PPAR-ID. Depending on the system configuration, you ecify an integer from 0 to 15 for <i>ppar_id</i> .	
	-s cpu	Displa	ys the CPU Activation information.	
	-v		ys detailed information. It the $-v$ option is specified, the own of keys is displayed.	
EXTENDED DESCRIPTION	The following p	parameters	s are displayed as the types of resource.	
	PROC	CPU cor	e resource	
EXAMPLES	EXAMPLE 1 Disp	play all CP	U Activations information in detail (in the case that the plat-	

l

adm or platop privilege is owned).

	XSCF> showcod -v -s cpu
	PROC Permits installed : 8 cores
	PROC Permits assigned for PPAR 0 : 4 [Permanent 4cores]

NAME	showcodactivation - Displays the current CPU Activation key information added to the system.			
SYNOPSIS	showcodactivat	tion [-r -v] [-i <i>key-index</i>] [-M]		
	showcodactivat	tion -h		
DESCRIPTION		ration is a command to display the CPU Activation key ded to the system.		
		ivation is executed with nothing specified, the current CPU information is displayed.		
		ails on the CPU Activation key, see the <i>Fujitsu SPARC M12 and</i> ARC M10 System Operation and Administration Guide.		
Privileges	To execute this	command, platadm or platop privilege is required.		
	For details on u	user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-i key-index	Displays the CPU Activation key information of the administration number specified in <i>Key-index</i> .		
	-M	Displays text one screen at a time.		
	-r	Displays information on CPU Activation key along with the index information (management number) that is saved in XSCF.		
	-v	Displays detailed information. The CPU Activation key information is displayed in both of the table format and raw data format.		
EXTENDED DESCRIPTION	If showcodact	ivation is used, the following information is displayed.		
	Index	Administration number in the XSCF of the CPU Activation key.		
	Description	Type of resources (processor). For CPU Activation, PROC is displayed.		
	Count	Number of the CPU Activations given to resources.		
I				

```
EXAMPLES
              EXAMPLE 1
                         Display the CPU Activation key information on SPARC M10-1.

NAME	showcodactivationhistory - Displays the logs to add and delete the CPU Activation keys (Capacity on Demand (CoD) logs).			
SYNOPSIS	showcodactivati	onhistory [–M]		
	showcodactivati	onhistory [-V] -m mail_address		
	showcodactivati	onhistory [-V] [-u user] [-p proxy [-t proxy_type]] target_url		
	showcodactivati	onhistory -h		
DESCRIPTION		tionhistory is a command to display the records regarding etion of CPU Activations keys in the CoD logs.		
Privileges	To execute this c	ommand, any of the following privileges is required.		
	platadm, plato	pp,fieldeng		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-M	Displays text one screen at a time.		
	-m <i>mail_address</i>	Specifies the email address to which the CoD log is to be sent.		
	-p proxy	Specifies the proxy server to be used for transfers. The default transfer type is http, unless modified using the -t <i>proxy_type</i> . The value for proxy must be in the format <i>servername</i> [:port].		
	-t proxy_type	Use with the -p to specify proxy type as http, socks4, or socks5. The default is http.		
	-u <i>user</i> Specifies the user name when logging in to a remote ftp or http server that requires authentication. Prompts for a password.			
	-V	Displays details of network activity, which might be helpful in diagnosing network or server problems.		

OPERANDS	The following operands are supported.		
	<i>target_url</i> Specifies the URL to be the output destination of the CoD logs. The following types of format are supported.		
	Specify an absolute path for a file.		
	<pre>http://server[:port]/absolute_path/file https://server[:port]/absolute_path/file ftp://server[:port]/absolute_path/file file:///media/usb_msd/absolute_path/file</pre>		
EXAMPLES	EXAMPLE 1 Output the CoD logs.		
	<pre>XSCF> showcodactivationhistory 11/30/2012 01:42:41PM PST: Report Generated SPARC M10-1 SN: 843a996d 10/02/2012 02:08:49PM PST: Activation history initialized: PROC 0 cores 10/15/2012 01:36:13PM PST: Capacity added: PROC 2 cores 10/15/2012 01:46:13PM PST: Capacity added: PROC 2 cores 11/07/2012 01:36:23PM PST: Configuration backup created: PROC 2 cores 11/27/2012 01:46:23PM PST: Configuration restored: PROC 2 cores 11/28/2012 01:37:12PM PST: Capacity added: PROC 2 cores 11/28/2012 01:37:12PM PST: Capacity added: PROC 2 cores 11/30/2012 01:37:19PM PST: Capacity added: PROC 2 cores 11/30/2012 01:41:19PM PST: Capacity added: PROC 2 cores 11/30/2012 01:42:41PM PST: Capacity added: PROC 2 cores 11/30/2012 01:42:41PM PST: Summary: PROC 10 cores Signature: yU27yb0oth41UL7h1eA2vHL7S1aX4pmkBTIxesD1XEs</pre> EXAMPLE 2 Sending the CoD logs to the specified user via email. NAME	showcodusage - Display the usage information of CPU core resources.			
SYNOPSIS	<pre>showcodusage [-v] [-M] [-p {resource ppar all}]</pre>			
	showcodusage	-h		
DESCRIPTION	showcodusage resource.	e is a com	mand to display the usage information of CPU core	
	If showcodusage is executed with nothing specified, the overview of the CPU Activation in use and installed is displayed with the current status of CPU core resources.			
Privileges	To execute this	command	, any of the following privileges is required.	
	platadm,plat fieldeng	cop,	Enables execution for all physical partitions (PPARs).	
	pparadm, ppar pparop	rmgr,	Enables execution for PPARs for which you have access privilege.	
	For details on ı	ıser privile	eges, see setprivileges(8).	
OPTIONS	The following o	options are	e supported.	
	-h		the usage. Specifying this option with another option or causes an error.	
	-M	Displays	text one screen at a time.	
	-p all	Displays	all usage information of CPU core resources.	
	-p ppar	PPAR. N number number	ys the usage information of CPU core resources for each lumber of CPU core resources used in the PPAR, the of CPU core resources installed in the PPAR and the of CPU core activations allotted to the PPAR are included splayed information.	
	-p resource		formation of CPU core resources is displayed according spective types.	
	-v	Displays	detailed information.	

EXTENDED DESCRIPTION		e -p resource is 1 ing the system is di	used, the usage information of CPU core splayed.	
	Resource		PU core resources (processor) rameters are displayed.	
		PROC	CPU core resources. The unit is cores.	
	In Use	system If communication	PU core resources currently used in the with Hypervisor cannot be established, the U core resources currently used in the	
	Installed	Number of the CF	PU core resources installed to the system	
	COD Permitted	Number of the CF	PU Activations which have been installed	
	Status	Any of the follow:	ing CoD statuses	
		OK	Indicates that there is enough number of CPU Activations for the CPU core resources in use. Moreover, the number of currently unused CPU Activations is also displayed. There are some violation of CPU Activation. The number of the CPU core resources in use which exceeds the number of the CPU Activations available is displayed. May occur if the total number of used CPU core resources exceeds the total number of CPU Activations, that can be allotted to the whole system.	
		e -p ppar is used, ing each PPAR is di	the following usage information of CPU core isplayed.	
	PPAR-ID/	Each PPAR and type of CPU core resources		
	Resource	The CPU core resources with Unused displayed are those used in PPAR.		
	In Use	Number of the CI	PU core resources currently used in PPAR	
		If connection cannot be established with the hypervisor, the number of CPU core resources that is presently used in the PPAR will be 0.		
	Installed	Number of the CI	PU core resources installed to PPAR	

	Assigned	Number of	the CPU o	ore resources assigned to	PPAR
	Unused	Number of	currently	unused CPU Activations i	n the system.

NAME		n - Displays the info physical partition (rmation of the domain console that is currently PPAR).	
SYNOPSIS	showconsolepat	h -a		
	showconsolepat	h -p ppar_id		
	showconsolepat	h -h		
DESCRIPTION		showconsolepath is a command to display the information of the domain consoles currently connected to PPAR.		
	The following co	The following contents are displayed.		
	User	XSCF user accour	ts connected to the domain consoles	
	PPAR-ID	PPAR ID		
	RO/RW	Type of domain c	onsole	
		ro rw	Read-only console Writable console	
	escape	Escape sign set in	console	
	Date	Date and time wh	en XSCF connected to the domain console	
Privileges	To execute this c	ommand, any of the	e following privileges is required.	
	useradm,plata fieldeng	useradm, platadm, platop, Enables execution for all PPARs. fieldeng		
	pparadm, pparm		es execution for PPARs for which you have privilege.	
	For details on us	er privileges, see se	etprivileges(8).	
OPTIONS	The following op	otions are supported	l.	
	-a	Displays the infor accessible PPARs.	mation of the consoles connected to all	
	-h	Displays the usag or operand causes	e. Specifying this option with another option s an error.	
	-p ppar_id		R-ID to display the information. Depending on uration, you can specify an integer from 0 to 15	

EXTENDED To one PPAR, just one writable console can be connected while multiple read-only consoles can be connected.

EXAMPLES EXAMPLE 1 Display the information of the consoles connected to all accessible PPARs.

	XSCF> showcor	nsolepath	-a		
	User	PPAR-ID	ro/rw	escape	Date
	nakagawa	00	rw	@	Fri Jul 29 21:23:34

	yuuki	01	rw		Fri Jul 29 10:19:18
	uchida	01	ro	*	Fri Jul 29 13:30:41
EXIT STATUS	The following ex	kit values ar	e return	ed.	
	0	Indicates	normal	end.	
	>0	Indicates	error oc	currence.	
SEE ALSO	console(8), send	lbreak(8)			

NAME	showdate - Displays the date and time of the XSCF clock.
SYNOPSIS	showdate [-u]
	showdate -h
DESCRIPTION	showdate is a command to display the date and time of the XSCF clock.
Privileges	To execute this command, any of the following privileges is required.
	useradm, platadm, platop, Enables execution for all PPARs. auditadm, auditop, fieldeng
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
	-u Specifies the time in the Universal Coordinated Time (UTC). If omitted, the local time is applicable.
EXTENDED DESCRIPTION	You can set the date and time of the XSCF clock by using setdate(8).
EXAMPLES	EXAMPLE 1 Display the current time in local time (JST).
	XSCF> showdate Sat Oct 20 14:53:00 JST 2012
	EXAMPLE 2 Display the current time in UTC.
	XSCF> showdate -u Sat Oct 20 05:56:15 UTC 2012
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>setdate(8), settimezone(8), showtimezone(8)</pre>

showdate(8)

NAME	showdateinfo - D	isplays the dates and times of the XSCF and logical domains.
SYNOPSIS	showdateinfo -p	ppar_id [-i index] [-M]
	showdateinfo -h	
DESCRIPTION	XSCF and logical whether the dates this command dis	s a command to display the dates and times of the clocks of the domains. Execute this command before start of the PPAR to check s and times of logical domains are correct. After start of the PPAR, splays only the date and time of the XSCF, and does not display use of logical domains.
	PPAR-ID	PPAR ID
	config_name	Logical domain configuration name
	Date	Displays the dates and times of the XSCF and logical domains.
	Dates and times a	are displayed in the time of the XSCF time zone.
	2001 or earlier) du	nd time of the XSCF have reverted back to the initial values (year ue to maintenance replacement, "*" is displayed at the beginning of ne XSCF time and NTP setting.
Privileges	To execute this co	ommand, any of the following privileges is required.
	platadm, plato	p,pparadm,pparmgr,pparop,fieldeng
OPTIONS	The following op	tions are supported.
	-p ppar_id	Specifies the PPAR-ID for which the dates and times of logical domains are displayed. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
	-i index	Specifies the management number of the logical domain configuration. You can confirm the management number by showdomainconfig(8). You can specify an integer from 1 to 8.
	-M	Displays text one screen at a time.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	started at the nex	otion is omitted, the dates and times of the logical domain to be at PPAR start are displayed. You can confirm the logical domain be used at the next PPAR start by showdomainconfig(8).
EXAMPLES	EXAMPLE 1 Displa	ay the dates and times of the logical domains of PPAR-ID 0 to be started

```
next time and the date and time of the XSCF.
```

showdateinfo(8)

NAME	showdateoffset - each physical par	Displays the difference between the system time and the time of tition (PPAR).
SYNOPSIS	showdateoffset -	p ppar_id
	showdateoffset	[-a]
	showdateoffset -	h
DESCRIPTION		t is a command to display the difference between the system time XSCF clock and the time managed by each PPAR clock, by seconds.
	If system time ha	rence between the system time and the time of each PPAR is stored. Is been changed either by setdate(8) or by synchronization with the difference between the time of each PPAR and the changed bodated.
	The difference of	the time is retained even if PPAR or the system is restarted.
Privileges	To execute this co	ommand, any of the following privileges is required.
	useradm,plata fieldeng	dm, platop, Enables execution for all PPARs.
	pparadm, pparm	gr, pparop Enables execution for PPARs for which you have access privilege.
	For details on us	er privileges, see setprivileges(8).
OPTIONS	The following op	tions are supported.
	-a	Displays the differences form the times of all PPARs.
		Even if the option is omitted, the difference from the times of all PPARs as in the case that the -a option is specified.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-p ppar_id	Specifies the PPAR-ID to display the difference from the system time. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
EXAMPLES	EXAMPLE 1 Displ 1.	ay the difference between the system time and the time of PPAR-ID
	XSCF> showdat	—
	PPAR-ID 01	Domain Date Offset 0 sec
I		

		spray the unrefereed between the system time and the times of an i i into.
	XSCF> show	dateoffset -a
	PPAR-ID	Domain Date Offset
	00	0 sec
	01	0 sec
	02	0 sec
	03	0 sec
	04	0 sec
	05	0 sec
	06	0 sec
	07	0 sec
	08	0 sec
	09	0 sec
	10	0 sec
	11	0 sec
	12	0 sec
	13	0 sec
	14	0 sec
	15	0 sec
EXIT STATUS	The following	; exit values are returned.
	0	Indicates normal end.
	0	indicates normal end.
	>0	Indicates error occurrence.
SEE ALSO	resetdateoffse	et (8)

EXAMPLE 2 Display the differences between the system time and the times of all PPARs.

NAME	showdomainconfig - Displays the configuration information of the logical domain of the specified physical partition (PPAR).	
SYNOPSIS	showdomaincon	fig -p ppar_id [-M]
	showdomaincon	fig -h
DESCRIPTION	showdomaincon information.	fig is a command to display the logical domain configuration
	The following set	tting values are displayed.
	Index	Administration number in the XSCF of logical domain configuration
	PPAR-ID	PPAR ID
	Booting config (Current)	Logical domain configuration name used in the PPAR currently in operation
	Booting config(Next)	Logical domain configuration name used next time when PPAR is started
	config_name	Logical domain configuration name
	date_created	Date and time to create logical domain configuration
	domains	Number of the logical domains included in logical domain configuration
		Note – The number of logical domains, which were in the bound or active state when you used the ldm add-spconfig command to save the logical domain configuration information to the XSCF, is displayed.
Privileges	To execute this co	ommand, any of the following privileges is required.
	useradm, platadm, platop, fieldeng, pparadm, pparmgr, pparop	
	For details on us	er privileges, see setprivileges(8).
I		

OPTIONS	The following options are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-M	Displays text one screen at a time.
	-p ppar_id	Specifies the PPAR-ID to display the logical domain configuration information.Depending on the system configuration, you can specify only one integer from 0 to 15 for <i>ppar_id</i> .
EXTENDED DESCRIPTION	mode of Oracle	nain configuration information has been recovered by the recovery VM Server for SPARC, the [degraded] keyword is added at the omain configuration information name, displayed by Booting ent).
EXAMPLES	EXAMPLE 1 Disp	lay the logical domain configuration information set in PPAR-ID 0.
	PPAR-ID : Booting confi (Current) : (Next) :	g ldm-set1
	domains : date_created:	factory-default 1 -
	Index : config_name : domains : date_created:	ldm-set1
	Index : config_name : domains : date_created:	3 ldm-set2
	Index : config_name : domains :	4
	EXAMPLE 2 The f	following is an example of the logical domain configuration information

```
that is recovered by the Oracle VM Server for SPARC recovery mode.
              XSCF> showdomainconfig -p 0
              PPAR-ID :0
              Booting config
               (Current) :recovery-resource [degraded]
               (Next) :recovery-resource
              _____
              Index :1
              config_name :factory-default
              domains :1
              date_created:-
              _____
                    :2
              Index
              config_name :recovery-resource
              domains :4
              date_created: '2014-06-19 14:53:38'
              XSCF>
EXIT STATUS
             The following exit values are returned.
             0
                         Indicates normal end.
                         Indicates error occurrence.
             >0

showdomainconfig(8)

NAME	showdomainstatus - Displays the status of the current logical domain.		
SYNOPSIS	showdomainstatus -p ppar_id [-v] [-M] [-g domainname]		
	showdomainstatus -h		
DESCRIPTION	showdomainstatus is a command to display the status of the current logical domain.		
	The statuses to be displayed are below.		
	 Logical Domain Na 	ame	
	Host name of logical domain. If the number of characters in the host name exceeds 21, the characters after the 21st characters are not displayed. If the logical domain has not been started, "-" is displayed.		
	∎ Status		
	Operating status of the current logical domain. The following statuses are displayed.		
	Host Stopped	The logical domain is stopped	
	Solaris booting	In the status in which the Oracle Solaris of the logical domain is booting	
	Solaris running	In the status in which the Oracle Solaris of the logical domain is running	
	Solaris halting	In the status in which the Oracle Solaris of the logical domain is executing the shutdown processing	
	Solaris suspended	In the status in which the Oracle Solaris of the logical domain is suspended	
	Solaris powering down	In the status in which the Oracle Solaris of the logical domain is executing the power-off processing	
	Solaris rebooting	In the status in which the Oracle Solaris of the logical domain is being reset	
	Solaris panicking	In the status in which a panic is occurring in the Oracle Solaris of the logical domain	
	Solaris debugging	In the status in which the kmdb prompt of the logical domain is stopped	
		In the status in which Kernel Debug is running	
	OpenBoot initializing	In the status in which the OpenBoot PROM of the logical domain is executing the initialization processing	

	OpenBoot Running	In the status in which the OpenBoot PROM of the logical domain has completed initialization or the operation is stopped by the ok prompt
	OpenBoot Primary Boot Loader	In the status in which the Oracle Solaris of the logical domain is loading
	OpenBoot Running OS Boot	In the status in which the Oracle Solaris of the logical domain is in transition
	OS Started. No state support	In the status in which the Oracle Solaris of the logical domain has been transited
	OpenBoot Running Host Halted	In the status in which the Oracle Solaris of the logical domain is executing init 0
	OpenBoot Exited	In the status in which the ok prompt of the logical domain is executing reset-all
	OpenBoot Host Received Break	In the status in which the Oracle Solaris of the logical domain called enter service
	OpenBoot Failed	In the status in which an error occurred in the initialization of the logical domain by OpenBoot PROM
	Unknown	In the status in which the host name matching that of the logical domain specified by the option by the user is not found and unknown
		Includes the state when add-spconfig had not been executed by Logical Domains (LDoms) Manager and the case when add-spconfig had been executed by Logical Domains (LDoms) Manager while the logical domain was in the unbind state.
	-	In the status in which no physical partition (PPAR) is defined
Privileges	To execute this comman	d, any of the following privileges is required.
	useradm,platadm,pla fieldeng	top, Enables execution for all PPARs.
	pparadm, pparmgr, ppa	arop Enables execution for PPARs for which you have access privilege.
	For details on user privi	leges, see setprivileges(8).

l

OPTIONS | The following options are supported.

	-g domainname	Specifies the host name of the logical domain to be displayed. If the -g option is omitted, the information of all logical domains under the PPAR to be displayed is displayed.
		Up to 255 characters can be used to specify <i>domainname</i> . To include "#" in <i>domainname</i> , specify a backslash (\) just before it like "\#". To include ";", specify a backslash (\) just before it like "\;". To include "(", specify a backslash (\) just before it like "\(". To include ")", specify a backslash (\) just before it like "\(". To include ")", specify it by enclosing the entire value in single quotation marks (') or double quotation marks ("). (e.g. 'guest01').
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-M	Displays text one screen at a time.
	-p ppar_id	Specifies the PPAR-ID to display the status. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .
	-v	Displays detailed information. The ID of the logical domain (hexadecimal notation) will also be displayed.
EXTENDED DESCRIPTION	domains to either	he configuration of logical domains, render the state of all logical r "active" or "bound" and then execute the ldm add-spconfig control domain to store the latest configuration information in
	state when config	ven one logical domain which was not in either "active" or "bound" guration information was stored in XSCF, if that logical domain th the –g option, any of the following symptoms will occur:
	The state of the logical domain will be "Unknown".	
	 A wrong logic 	al domain name will be displayed.
EXAMPLES	EXAMPLE 1 Displ	ay the statuses of all logical domains on PPAR-ID 0.
	XSCF> showdom	ainstatus -p 0
	Logical Domain	
	primary	Solaris running
	guest00	Solaris running
	guest01 guest02	Solaris booting Solaris powering down
	guest03	Solaris powering down Solaris panicking
	3400000	

	guest04	Shutdown Started
	guest05	OpenBoot initializing
	guest06	OpenBoot Primary Boot Loader
	EXAMPLE 2	Display the statuses of the logical domain whose name is guest01 on PPAR-ID 0.
	XSCF> sh	owdomainstatus -p 0 -g guest01
		Domain Name Status
	guest01	Solaris powering down
	EXAMPLE 3	Display detailed information of the logical domain guest01, which is located on PPAR-ID 0.
	XSCF> sh	owdomainstatus -p 0 -v -g guest01
	GID	Logical Domain Name Status
	0000002	guest01 Solaris powering down
	EXAMPLE 4	Displays the status of the logical domain named as guest01 on PPAR-ID 0 (no PSB is assigned to PPAR).
		owdomainstatus -p 0 -g guest01 Domain Name Status
	PPAR 0 i	s not configured.
EXIT STATUS	The follow	ing exit values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

NAME	showdualpowerfeed - Displays the status of the dual power feed mode.		
SYNOPSIS	showdualpowerfeed		
	showdualpowerfeed -h		
DESCRIPTION	showdualpowerfeed is a command to display the status of the dual power feed mode.		
	Note – The SPARC M10 system and the SPARC M12-1 each have two mounted power supply units. Even when the dual power feed function is set to enabled/disabled, the setting will not make any changes to the system behavior in the redundant configuration. The function for setting dual power feed is used as a "memo" for the system administrator to check the current status. The SPARC M12-2/M12-2S has four mounted power supply units. In cases of dual power feed, each power feed system consists of two power supply units. For details, see the <i>Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide</i> .		
	The dual power feed mode can be set by setdualpowerfeed(8).		
Privileges	To execute this command, platadm or fieldeng privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	EXAMPLE 1 On the SPARC M10-1, displays the current setting of dual power feed mode.		
	XSCF> showdualpowerfeed		
	BB#00: Dual power feed is enabled.		
	EXAMPLE 2 On the SPARC M10-4S (with crossbar boxes), displays the current setting of dual power feed mode.		
	XSCF> showdualpowerfeed		
	BB#00:Dual power feed is disabled.		
	BB#01:Dual power feed is disabled. BB#02:Dual power feed is disabled.		
	BB#03:Dual power feed is disabled.		
	BB#04:Dual power feed is disabled.		
	BB#05:Dual power feed is disabled.		
	BB#06:Dual power feed is disabled.		
	BB#07:Dual power feed is disabled.		

	BB#08:Dual power feed is disabled.
	BB#09:Dual power feed is disabled.
	BB#10:Dual power feed is disabled.
	BB#11:Dual power feed is disabled.
	BB#12:Dual power feed is disabled.
	BB#13:Dual power feed is disabled.
	BB#14:Dual power feed is disabled.
	BB#15:Dual power feed is disabled.
	XBBOX#80:Dual power feed is disabled.
	XBBOX#81:Dual power feed is disabled.
	XBBOX#82:Dual power feed is disabled.
	XBBOX#83:Dual power feed is disabled.
	EXAMPLE 3 On the SPARC M10-4S (without crossbar boxes), displays the current setting of dual power feed mode.
	XSCF> showdualpowerfeed
	BB#00:Dual power feed is enabled.
	BB#01:Dual power feed is enabled.
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	setdualpowerfeed (8)

NAME	showemailreport - Displays the settings data of the e-mail report.
SYNOPSIS	showemailreport [-v]
	showemailreport -h
DESCRIPTION	showemailreport is a command to display the settings data of the e-mail report.
	If it is used without specifying any options, the settings data of the current e-mail report is displayed.
Privileges	To execute this command, any of the following privileges is required.
	platadm, platop, fieldeng
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
	-v Displays detailed information.
EXAMPLES	EXAMPLE 1 Display the settings of the e-mail report.
	XSCF> showemailreport EMail Reporting: enabled Email Recipient Address: admin@company.com, adm2@company.com
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

NAME	showenvironment - Displays the intake-air temperature, temperature sensor information, voltage sensor information, and fan rotation information of the system.	
SYNOPSIS	showenvironme	nt [-M][temp volt Fan power air]
	showenvironme	nt -h
DESCRIPTION	showenvironme	ent is a command to display the following information.
	The following in	formation is displayed.
	Environment information	Intake-air temperature of the SPARC M12/M10 system
	Temperature information	Intake-air temperature of the SPARC M12/M10 system and air temperature information of each component
		You can confirm the air temperature information of the following components.
		SPARC M10-1
		Mother board unit (MBU), CPU, DIMM, SW, SAS
		SPARC M10-4/M10-4S (without crossbar box) CMUU, CMUL, CPU, DIMM, SW, SAS, XBChip (BB)
		SPARC M10-4S (with crossbar box)
		CMUU, CMUL, CPU, DIMM, SW, SAS, XBChip (BB), XBChip (XB-Box)
		SPARC M12-1
		Mother board unit (MBU), CPU, DIMM, SW, SAS, GIGALAN
		SPARC M12-2/M12-2S (without crossbar box)
		CMUU, CMUL, CPU, DIMM, SW, SAS, GIGALAN, SAS- EXP, XBChip (BB)
		SPARC M12-2S (with crossbar box) CMUU, CMUL, CPU, DIMM, SW, SAS, GIGALAN, SAS- EXP, XBChip (BB), XBChip (XB-Box)
	Voltage	Voltage sensor value
	information	Displays the margin settings information if voltage margin is set.
	Fan rotation information	Rotation status and speed of fan
	Power monitor	Power consumption information
	Air flow	Exhaust-air amount of the SPARC M12/M10 system

showenvironment(8)

Privileges	To execute this co	ommand, any of the	following privileges is required.
	useradm, plata	dm,platop,field	eng
	For details on us	er privileges, see se	tprivileges(8).
0.777.0110			
OPTIONS	The following op	tions are supported	
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.
	-M	Displays text one	screen at a time.
OPERANDS	The following op	erands are supporte	ŀd.
	temp volt Fan power air	following types ca	of the information to be displayed. Any of the n be specified. If omitted, the information of perature of the SPARC M12/M10 system is
		temp	Displays the temperature information.
		volt	Displays the voltage information.
		Fan	Displays the rotation information of fan.
		power	Displays the power consumption information.
		air	Displays the exhaust-air amount of the system.
EXTENDED DESCRIPTION		1 7 7	wer and air operands does not include the hit or the peripheral I/O devices.
EXAMPLES	EXAMPLE 1 Displ	ay the intake-air temj	perature of the system.

NAME	showfru - Displays the contents of settings regarding the hardware devices.		
SYNOPSIS	showfru device location		
	showfru -a [-M]		
	showfru -h		
DESCRIPTION	 Showfru is a command to display the contents set in the hardware of the device by setupfru(8). The contents of the specified device or all devices can be displayed. You can special physical system board (PSB) as the device. 		
	The following contents are displayed.		
	Device Device name		
	Any of the following values is displayed.		ng values is displayed.
		sb	PSB
		сри	CPU in PSB
	Location	Position where the	device is mounted
		This is displayed in	n the format below.
	 If Device is sb 		
		<i>xx-y</i> :	
		xx y	BB-ID which is an integer from 00 to 15 It is fixed to 0.
		If Device is cp	
			-
		xx-y-z: xx	BB-ID which is an integer from 00 to 15
		y	It is fixed to 0.
		Ζ	CPU chip number For SPARC M12-1/M10-1: 0 For SPARC M10-4/M10-4S: integer from 0 to
			For SPARC M12-2/M12-2S: 0 or 2
	Memory Mirror	Mirror mode of the memory set in PSB	
	Mode Either of the following values is displayed.		ving values is displayed.
		yes	Memory mirror mode
		no	Not in the memory mirror mode
I			

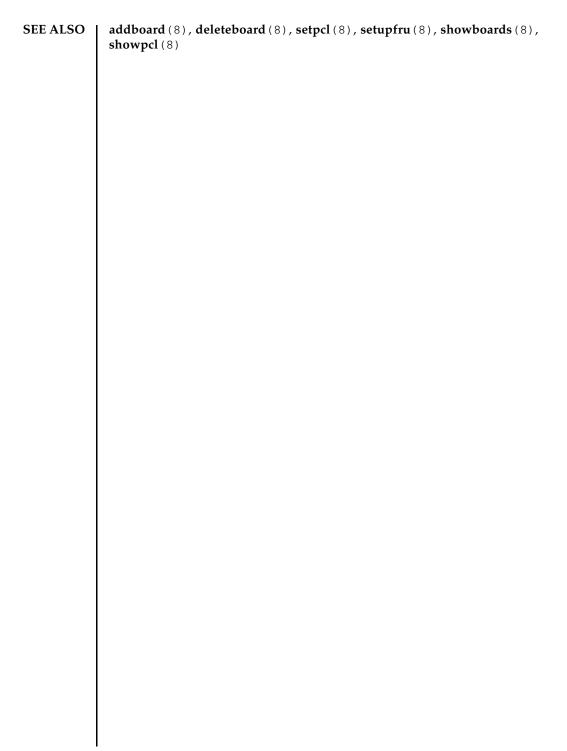

showfru(8)

Privileges	To execute this command, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-a	Displays the cont	ents of all devices.	
	-h	Displays the usag or operand causes	e. Specifying this option with another option s an error.	
	-M	Displays text one	screen at a time.	
OPERANDS	The following o	e following operands are supported.		
	device	Specifies the device be specified.	ce to be displayed. The following devices can	
		sb	PSB	
		cpu	CPU in PSB	
	location	Specifies the locat	ion where the <i>device</i> is mounted.	
		This is specified using the following format.If <i>device</i> is sb		
		<i>xx-y</i> :		
		xx	BB-ID which is an integer from 00 to 15	
		y	It is fixed to 0.	
		■ If <i>device</i> is cpu		
		<i>xx-y-z</i> :		
		xx	BB-ID which is an integer from 00 to 15 It is fixed to 0.	
		$\frac{y}{z}$	CPU chip number	
		~	For SPARC M12-1/M10-1: 0	
			For SPARC M10-4/M10-4S: integer from 0 to	
			5 For SPARC M12-2/M12-2S: 0 or 2	
EXTENDED DESCRIPTION	You can set the hardware of the devices by using setupfru(8).

NAME	showhardconf - Displays the information of the Field Replaceable Unit (FRU) mounted on the server.			
SYNOPSIS	showhardconf [-u] [-M]			
	showhardconf -h			
DESCRIPTION	showhardconf is a command to display the information of each FRU. The information to be displayed is below.			
	Current configuration and status			
	Number of the mounted unitsPhysical partition (PPAR) information			
	 PCI Expansion Un 			
	 PCI card information 			
Privileges	To execute this comm	mand, any of the following privileges is required.		
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng			
	pparadm, pparmgr,	pparop Enables execution for PPARs for which you have access privilege.		
	For details on user p	privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
		isplays the usage. Specifying this option with another option r operand causes an error.		
	-M Di	isplays text one screen at a time.		
	op DI the	hisplays the number of each mounted FRU. In addition, the peration frequency is displayed for the CPU module. The MMM type and size are displayed for the memory. If omitted, he current configuration and status information and PPAR aformation of each FRU are displayed.		

EXTENDED DESCRIPTION

If the configuration, status information, and PPAR information of FRU is displayed, an asterisk (*) indicating an abnormality and any of the following statuses are displayed for the units in which a failure or degradation occurred.

	Status	Contents		
	Faulted	In the status in which the unit is not in operation due to a failure.		
	Degraded	A part of the unit has failed or degraded, but the unit is running.		
	Deconfigured	Due to the failure or degradation of another unit, the target unit and components of its underlying layer has been degraded, though there is no problem in them.		
	Maintenance	Maintenance work is in progress. addfru(8), replacefru(8), or initbb(8) is operating.		
	Normal	In the status in which the unit is in normal operation.		
	 For SPARC M12-2S/M10-4S, if the mode switches on the operator panels of the master chassis and chassis whose XSCFs are standby do not match, an asterist (*) is displayed on the operator panel units of the master chassis and chassis whose XSCFs are standby. 			
	 The PCI Express (PCIe) card information for a guest domain is applied after Oracle Solaris starts on the guest domain. 			
	 PCI card information and PCI expansion unit information are displayed under the conditions below. FRU in the factory-default configuration The condition is that the power of the PPAR is on and OpenBoot PROM or Oracle Solaris has started. 			
	I/O resources In order for th	al domain configuration and not assigned to a logical domain not recognized by the logical domain are not displayed. e showhardconf command to display I/O resources that were) resources may need to be added on the control domain.		
		al domain configuration and already assigned to a logical domain is that Oracle Solaris on this logical domain has started.

showhardconf(8)

NAME	showhostname - whose XSCF is s	Displays the host names set in the master chassis and chassis tandby.
SYNOPSIS	showhostname	$\{-a \mid xscfu\}$
	showhostname -	-h
DESCRIPTION		is a command to display the host names set currently in the master sis whose XSCF is standby.
	The host name is	s displayed in the Fully Qualified Domain Name (FQDN) format.
Privileges	No privileges are	e required to execute this command.
	For details on user privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.
	-a	Displays the host names set in the master chassis and chassis whose XSCF is standby. The chassis name specified with the -a option becomes invalid.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
OPERANDS	The following op	perands are supported.
	xscfu	Specifies the chassis name to be displayed. Depending on the system configuration, you can specify the following. If the chassis name is specified with the -a option, it becomes invalid.
		 For configuration with SPARC M12-2S/M10-4S (with crossbar box)
		For XBBOX#80, specify "xbbox#80."
		For XBBOX#81, specify "xbbox#81."
		 For configuration with SPARC M12-2S/M10-4S (without crossbar box)
		For BB#00, specify "bb#00."
		For BB#01, specify "bb#01."
		 For configuration with SPARC M12-1/M12-2/M10-1/M10-4 Specify "bb#00."
		Specify DD#00.
EXTENDED DESCRIPTION		chostname(8), you can set the host name of the master chassis and hich XSCF is in the standby status.

showhostname(8)

EXAMPLES	EXAMPLE 1 Display the host name which has been set to the master chassis and the chassis on which XSCF is in the standby status.
	XSCF> showhostname -a bb#00:scf0-hostname.example.com bb#01:scf1-hostname.example.com
	EXAMPLE 2 Display the host name set in XBBOX#80.
	XSCF> showhostname xbbox#80 xbbox#80:scf0-hostname.example.com
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	sethostname (8)

NAME	showhsmode - Displays the setting of the high speed mode of the CPU.
SYNOPSIS	showhsmode
	showhsmode -h
DESCRIPTION	showhsmode displays the setting of the high speed mode of the CPU.
	The setting is enabled (on) or disabled (off). The default setting is disabled (off).
	This command is not supported on SPARC M12-1/M12-2/M10-1/M10-4/M10-4S.
Privileges	To execute this command, any of the following privileges is required.
	platadm, platop, fieldeng
	For details on user privileges, see setprivileges(8).
OPTIONS	The following option is supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXAMPLES	EXAMPLE 1 Display the current setting of the high speed mode of the CPU.
	XSCF> showhsmode off
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

showhsmode(8)

NAME	showhttps - Disp	lays the status of the HTTPS service set in the XSCF network.
SYNOPSIS	showhttps [-M]	
	showhttps -t	-M]
	showhttps -h	
DESCRIPTION	showhttps is a c in the XSCF netw	command to display the status of the HTTPS service set currently ork.
		whether HTTPS service is in operation and the installation status n required for authentication. If it is installed, the date of o displayed.
	The following sta	tuses are displayed.
	HTTPS status	Whether HTTPS service is in operation
	Server key	Whether the private key of the Web server is installed
	CA key	Whether the private key of the certificate authority is installed
	CA cert	Whether the certificate of the certificate authority is installed
	CSR	Web server certificate request
Privileges	No privileges are	required to execute this command.
	For details on use	er privileges, see setprivileges(8).
OPTIONS	The following op	tions are supported.
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-M	Displays text one screen at a time.
	-t	Displays the set certificate.
EXTENDED DESCRIPTION	You can set the H	ITTPS service of the XSCF network by using sethttps(8).
EXAMPLES	EXAMPLE 1 Displ	ay the status of HTTPS service and the installation status of the key.
	CA key: instal	-

NAME	showinterimperr Interim Permit.	nit - Displays	the status and information about CPU Activation
SYNOPSIS	showinterimper	mit [−M] [−V] [-p ppar_id]
	showinterimper	mit -h	
DESCRIPTION			mand to display CPU Activation Interim Permit tus and information.
	status of Interim	Permit, the nu	mand displays the current enabled or disabled imber of days left before expiration, the expiration can be enabled again.
	If "-v" is specifie Interim Permit c		nd displays detailed information, including whether again.
	If no <i>ppar_id</i> is s _] are displayed.	pecified, the Ir	terim Permit status and information for all PPARs
Privileges	To execute this c	ommand, one	of the following privileges is required.
	platadm, plato	op,fieldeng	Enables execution for all physical partitions (PPARs).
	pparadm, pparm	ıgr, pparop	Enables execution for PPARs for which you have access privilege.
	For details on us	er privileges, s	see setprivileges(8).
OPTIONS	The following op	otions are supp	ported.
	-h		usage. Specifying this option with another option causes an error.
	-M	Displays tex	t one screen at a time.
	-p ppar_id	Specifies the	PPAR-ID to be displayed.
	-v	Displays wh	ether Interim Permit can be enabled again.

EXTENDED	The status c	of nterim Permit is dis	played in the following format for each PPAR.
DESCRIPTION	Interim F	Permit for PPAR 2	X: status
	X	ID of the PPAR	
	status	Displays the Interin following:	n Permit status and information; one of the
		disabled	Interim Permit is disabled. This also indicates that the function has never been used (Default), and can be enabled.
		enabled []	Interim Permit is enabled. The content displayed in [] indicates the number of days left before expiration. The number of days left before expiration is a value from 29 to 1. Example 1: enabled [25 days remaining] Indicates that the number of days left before expiration is 25. Example 2: enabled [less than 1 day remaining] Indicates that the Interim Permit will expire today.
		expired	Interim Permit has expired. In this state, available CPU core resources may be automatically reduced and/or logical domains in the system may be automatically stopped. To avoid automatic reduction of CPU core resources, immediately add sufficient purchased CPU Activations and assign them to the PPAR using setcod(8) or release CPU core resources from logical domains such that the total quantity of CPU core resources assigned to the logical domains is equal or lower than the quantity of purchased CPU Activations. Then disable Interim Permit. After Interim Permit is disabled, the <i>status</i> changes to "cannot be enabled again."

cannot be enabled again

Interim Permit cannot be reused. This indicates that the Interim Permit has already been used and cannot be used again. To reuse Interim Permit for a PPAR in this state, add purchased CPU Activation keys to the system using addcodactivation(8) and increase the number of CPU Activations assigned to the PPAR using setcod(8). XCP 232x behaves differently. Please refer to the *Fujitsu SPARC M12 and Fujitsu M10/SPARC M10 System Operation and Administration Guide* for further information.

If the -v option is specified, the command displays whether Interim Permit for each PPAR can be enabled again.

```
CPU Activation Information from the last time Interim Permit was enabled
```

Registered CPU Activation Keys (in units of cores) Displays the quantity of purchased CPU Activation keys installed on the entire system in units of cores, recorded at the moment setinterimpermit(8) was last executed to enable Interim Permit. If Interim Permit has never been used, "-" is displayed.

Purchased Cores Assigned to PPAR

Displays the quantity of CPU Activations (in units of cores) assigned to the PPAR, recorded at the moment setinterimpermit(8) was last executed to enable Interim Permit. If Interim Permit has never been used, "-" is displayed.

Current CPU Activation Information

Registered CPU Activation Keys (in units of cores) Displays the quantity of purchased CPU Activation keys currently installed on the entire system in units of cores.

Purchased Cores Assigned to PPAR

Displays the quantity of CPU Activations (in units of cores) currently assigned to the PPAR. Does not include Interim Permit cores.

Status	If Interim Permit is disabled and can be enabled, "Interim Permit is disabled (can be enabled)" is displayed.
	If Interim Permit is currently enabled and valid, "Interim Permit is enabled [xx days remaining]" is displayed.
	If Interim Permit is enabled and expired, "Interim Permit is expired" is displayed.
	If Interim Permit is disabled and cannot be enabled, "Interim Permit cannot be enabled again (until more Purchased CPU Activations are installed and Purchased cores are assigned to the PPAR)" is displayed.
	If Interim Permit has never been used, "-" is displayed.
	When Status shows "Interim Permit is disabled (can be enabled)", Interim Permit can be enabled again for a PPAR using setinterimpermit(8).
	When Status shows "Interim Permit is expired", to enable Interim Permit again, disable Interim Permit by executing "setinterimpermit -p <i>ppar_id</i> -c disable". Then, Status will show "Interim Permit is disabled (can be enabled)" or "Interim Permit cannot be enabled again (until more Purchased CPU Activations are installed and Purchased cores are assigned to the PPAR)".
	The showinterimpermit command was introduced in XCP 2320, but with support for SPARC M10-1 and SPARC M10-4 models only. The ability to reuse Interim Permit was introduced in XCP 2330. When XCP 232 <i>x</i> is used on the system, Interim Permit can be enabled only on SPARC M10-1 and M10-4 systems, and only once. Therefore, when XCP 232 <i>x</i> is used, be careful not to enable Interim Permit by mistake.
	When XCP 2330 or later is used on the system, Interim Permit can be re-enabled. But, to re-enable it the steps described below must be completed.
	If Interim Permit was used with XCP $232x$ and then the firmware was updated to XCP 2330 or later, Interim Permit cannot be enabled again, even when the steps described below have been completed. In this case, please contact your local service provider for assistance.
	To reuse Interim Permit, all of the following conditions must be met after the last time Interim Permit was used:

		 If currently enabled, Interim Permit must be disabled by setinterimpermit(8). Then the Status is changed to "Interim Permit cannot be enabled again (until more Purchased CPU Activations are installed and Purchased cores are assigned to the PPAR)".
		2. Quantity of installed purchased CPU Activation keys for this system must be increased by addcodactivation(8). The quantity of "Registered CPU Activation Keys (in units of cores)" under "Current CPU Activation Information" must be greater than the quantity shown in "CPU Activation Information from the last time Interim Permit was enabled".
		3. Quantity of CPU cores assigned to the PPAR (for SPARC M12-2S/M10-4S) / the system (for SPARC M12-1/M12-2/M10-1/M10-4) must be increased using setcod(8). The quantity of "Purchased Cores Assigned to PPAR" under "Current CPU Activation Information" must be greater than of the quantity shown in "CPU Activation Information from the last time Interim Permit was enabled".
		When all 3 conditions are met, then the Status is changed from "Interim Permit cannot be enabled again (until more Purchased CPU Activations are installed and Purchased cores are assigned to the PPAR)" to "Interim Permit is disable (can be enabled)".
		"Interim Permit is disabled (can be enabled)" shows that Interim Permit can now be used again.
EXAMPLES	EXAMPLE 1	Display Interim Permit information for PPAR-ID 0 (in this case Interim Per- mit is enabled and 25 days remain before expiration).
		Dowinterimpermit -p 0 Permit for PPAR 0: enabled [25 days remaining]
	EXAMPLE 2	Display Interim Permit information for PPAR-ID 0 (in this case Interim Per- mit is enabled and one day remains before expiration).
		nowinterimpermit -p 0 Permit for PPAR 0: enabled [1 day remaining]
	EXAMPLE 3	Display Interim Permit information for PPAR-ID 0 (in this case Interim Per- mit is enabled and will expire today).
		nowinterimpermit -p 0 Permit for PPAR 0: enabled [less than 1 day remaining]
	EXAMPLE 4	Display Interim Permit information for PPAR-ID 0 (in this case Interim Per-

mit is disabled and has never previously been enabled).

```
XSCF> showinterimpermit -p 0
Interim Permit for PPAR 0: disabled
```

EXAMPLE 5 Display Interim Permit information for PPAR-ID 0 (in this case Interim Permit was already enabled and cannot be used again).

```
XSCF> showinterimpermit -p 0
Interim Permit for PPAR 0: cannot be enabled again
```

EXAMPLE 6 Display Interim Permit information for PPAR-ID 0 (in this case Interim Permit has expired).

XSCF> **showinterimpermit** -**p 0** Interim Permit for PPAR 0: expired

EXAMPLE 7 Display Interim Permit information for all PPARs (in this case for SPARC M12-1/M12-2/M10-1/M10-4).

XSCF> **showinterimpermit** Interim Permit for PPAR 0: enabled [25 days remaining]

EXAMPLE 8 Display Interim Permit information for all PPARs (in this case the user has platform-related privileges on SPARC M12-2S/M10-4S).

XSCF> showinterimpermit

```
Interim Permit for PPAR 0: disabled
Interim Permit for PPAR 1: enabled [29 days remaining]
Interim Permit for PPAR 2: expired
Interim Permit for PPAR 3: cannot be enabled again
Interim Permit for PPAR 4: disabled
Interim Permit for PPAR 5: disabled
Interim Permit for PPAR 6: disabled
Interim Permit for PPAR 7: disabled
Interim Permit for PPAR 8: disabled
Interim Permit for PPAR 9: disabled
Interim Permit for PPAR 10: disabled
Interim Permit for PPAR 11: disabled
Interim Permit for PPAR 12: disabled
Interim Permit for PPAR 13: disabled
Interim Permit for PPAR 14: disabled
Interim Permit for PPAR 15: disabled
```

EXAMPLE 9 Display Interim Permit information for all PPARs (in this case the user has privileges for PPAR#0, #1, and #3 on SPARC M12-2S/M10-4S).

XSCF> showinterimpermit Interim Permit for PPAR 0: disabled Interim Permit for PPAR 1: enabled [29 days remaining] Interim Permit for PPAR 3: cannot be enabled again

EXAMPLE 10 Display whether Interim Permit for PPAR-ID 0 can be enabled again.

XSCF> showinterimpermit -v -p 0 PPAR-ID: 0 Status: Interim Permit is disabled (can be enabled) CPU Activation Information from the last time Interim Permit was enabled: Registered CPU Activation Keys (in units of cores): 16 Purchased Cores Assigned to PPAR: 8 Current CPU Activation Information: Registered CPU Activation Keys (in units of cores): 32 Purchased Cores Assigned to PPAR: 16 **EXAMPLE 11** Display whether Interim Permit for all PPARs can be enabled again (in the case of SPARC M12-1/M12-2/M10-1/M10-4). XSCF> showinterimpermit -v PPAR-TD: 0 Status: Interim Permit is disabled (can be enabled) CPU Activation Information from the last time Interim Permit was enabled: Registered CPU Activation Keys (in units of cores): 2 Purchased Cores Assigned to PPAR: 4 Current CPU Activation Information: Registered CPU Activation Keys (in units of cores): 4 Purchased Cores Assigned to PPAR: 8 **EXAMPLE 12** Display whether Interim Permit for all PPARs can be enabled again (in the case of a user with platadm privilege on SPARC M12-2S/M10-4S). XSCF> showinterimpermit -v PPAR-ID: 0 Status: Interim Permit is disabled (can be enabled) CPU Activation Information from the last time Interim Permit was enabled: Registered CPU Activation Keys (in units of cores): 2.4 Purchased Cores Assigned to PPAR: 8 Current CPU Activation Information: Registered CPU Activation Keys (in units of cores): 40 Purchased Cores Assigned to PPAR: 16 PPAR-TD: 1 Status: Interim Permit cannot be enabled again (until more Purchased CPU Activations are installed and Purchased cores are assigned to the PPAR) CPU Activation Information from the last time Interim Permit was enabled: Registered CPU Activation Keys (in units of cores): 2.4 Purchased Cores Assigned to PPAR: 8

```

showinterimpermit(8)

NAME	showinterimpermitusage - Displays information about CPU Activations and CPU core resources.					
SYNOPSIS	showinterimpermitusage [-M] [-p ppar_id]					
	showinterimpermitusage -h					
DESCRIPTION	showinterimpermitusage is a command to display CPU Activation Interim Permit (hereafter "Interim Permit") related information per PPAR. The information includes the quantity of CPU cores physically present in the PPAR, the quantity of CPU Activations assigned to the PPAR, the quantity of CPU core resources currently used by the PPAR, and the quantity of additional CPU Activations made available by Interim Permit.					
	If a user with the platadm or platop privilege executes showinterimpermitusage, the command displays the CPU Activation information of the entire system and CPU core resource usage per PPAR.					
	If a user with privileges only for the target PPAR executes showinterimpermitusage, the command displays the current CPU core resou usage of the target PPAR.					
	If no <i>ppar_id</i> is specified, the command displays the CPU Activation information of all PPARs and CPU core resource usage per PPAR.					
Privileges	To execute this command, one of the following privileges is required.					
	platadm, platop, fieldeng Enables execution for all physical partitions (P					
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.					
	For details on user privileges, see setprivileges(8).					
OPTIONS	The following options are supported.					
	-h Displays the usage. Specifying this option with another option or operand causes an error.					
	-M Displays text one screen at a time.					
	-p <i>ppar_id</i> Specifies the PPAR-ID to be displayed.					

EXTENDED DESCRIPTION

	Installed Cores	Quantity of CPU cores physically present in the PPAR
	Purchased Cores Assigned to PPAR	Quantity of CPU Activations (in units of cores) assigned to the PPAR
	Cores In Use by Ldoms	Quantity of CPU resources (in units of cores) currently used by Oracle VM Server for SPARC logical domains
	Interim Assignable Cores	Quantity of additional CPU Activations (in units of cores) made available by Interim Permit
		The displayed value is obtained by subtracting "Purchased Cores Assigned to PPAR" from "Installed Cores".
		If Interim Permit is disabled or has expired, "0" is displayed.
	In Use Interim Cores	Quantity of Interim Permitted CPU core resources (cores temporarily available as a result of Interim Permit being enabled) currently used by Oracle VM Server for SPARC logical domains
		The displayed value is obtained by subtracting "Purchased Cores Assigned to PPAR" from "Cores In Use by Ldoms".
		If quantity shown by "Cores In Use by Ldoms" is less than, or equal to the quantity shown by "Purchased Cores Assigned to PPAR", "In Use Interim Cores" displays "0".
		If Interim Permit is disabled or has expired, "0" is displayed.
EXAMPLES		Activation and CPU core resource information for the entire is case the user has platadm privilege on SPARC M12-2S/M10-

NAME	showldap - display the Lightweight Directory Access Protocol (LDAP) configuration for the XSCF.				
SYNOPSIS	showldap				
	showldap [-c]				
	showldap -h				
DESCRIPTION	showldap displays the LDAP configuration of XSCF. When invoked without options, showldap displays all LDAP configuration except for the server certificate and the password used when binding to the LDAP server.				
Privileges	You must have useradm or fieldeng privileges to run this command.				
	Refer to setprivileges(8) for more information.				
OPTIONS	The following options are supported:				
	-c Displays the LDAP server certification.				
	-h Displays usage statement.				
	When used with other options or operands, an error occurs.				
EXAMPLES	EXAMPLE 1 Displaying All LDAP Configuration Data				
	<pre>XSCF> showldap Bind Name: user Base Distinguishing Name: ou=people,dc=company,dc=com LDAP Search Timeout: 60 Bind password: Set LDAP Servers: ldap://company.com:389 CERTS: None</pre>				
	EXAMPLE 2 Displaying LDAP Server Certification				
	<pre>XSCF> showldap -c Certificate: Data: Version: 3 (0x2) Serial Number: fc:cl:32:c4:02:72:35:ea Signature Algorithm: sha256WithRSAEncryption Issuer: C=JP, ST=Kanagawa, L=Kawasaki, O=Fujitsu, OU=Fujitsu Validity Not Before: Jul 29 19:57:22 2013 GMT Not After : Jul 29 19:57:22 2014 GMT Subject: C=JP, ST=Kanagawa, L=Kawasaki, O=Fujitsu, OU=Fujitsu Subject Public Key Info: Public Key Algorithm: rsaEncryption</pre>				

	<pre>RSA Public Key: (1024 bit) Modulus (1024 bit): 00:db:dc:60:74:41:ab:a6:cf:3d:6c:43:ec:58:30: 65:29:15:92:c7:e7:af:d9:4c:8b:69:63:f4:77:66: 3a:27:db:4a:05:60:3a:39:d6:a8:e1:b1:9f:21:93: 1f:a1:c0:24:66:f2:0c:4b:7c:0f:7f:44:45:ee:99: 49:8f:48:f5:0f:b7:d5:c5:23:67:26:0c:b8:56:ea: 02:2a:c3:06:e2:97:5c:cc:ca:82:2b:02:7f:f1:44: 2a:7e:3c:00:d2:af:ab:35:53:d6:55:df:6b:f5:91: 53:95:21:4d:b0:e1:f4:d9:bc:9c:93:b0:72:0c:85: 3f:0e:91:bc:72:e2:fe:c9:93 Exponent: 65537 (0x1000) X509v3 extensions: X509v3 Subject Key Identifier: 1D:23:C0:57:EB:AA:29:CF:BD:A0:40:61:AC:B9:0D:FE:09:27:50:45 X509v3 Authority Key Identifier: keyid:1D:23:C0:57:EB:AA:29:CF:BD:A0:40:61:AC:B9:0D:FE:09:27:50:45 DirName:/C=JP/ST=Kanagawa/L=Kawasaki/O=Fujitsu, Inc./OU=Fujitsu serial:FC:C1:32:C4:02:72:35:EA X509v3 Basic Constraints: CA:TRUE Signature Algorithm: sha256WithRSAEncryption 90:56:fc:50:79:81:b1:59:ec:51:24:6f:d7:9c:e7:ac:63:09: 7b:74:5f:3c:72:94:d7:91:be:f2:f3:99:db:65:76:a0:3f:03: b1:96:06:48:d3:55:f8:2c:4e:3d:17:ba:66:47:81:a5:54:7f: c3:01:47:c0:cb:8b:4a:0b:3f:fc:e6:45:28:4d:1b:8d:da:72: 9f:8f:c5:5f:61:2b:96:e6:21:c3:55:3c:02:81:e2:cb:bd:ea: 00:18:59:93:5f:36:60:be:73:64:1a:41:14:ac:da:8d:d5:18: e8:16:40:77:fd:3a:ce:a4:60:a8:fd:3c:11:0f:72:e4:23:2d: 5c:d3</pre>	
EXIT STATUS	The following	exit values are returned:

SEE ALSO	setldap(8)	

NAME	showldapssl - show LDAP over SSL configuration and messages.			
SYNOPSIS	showldapssl			
	showldapssl cert [-v] [-i n]			
	showldapssl log [-M] [-C] [-S <i>start_record_number</i>] [-E <i>end_record_number</i>]			
	showldapssl log -	f		
	showldapssl group	padministrator[-i n]		
	showldapssl group	poperator[-i n]		
	showldapssl group	ocustom [-i n]		
	showldapssl user	lomain [-i n]		
	showldapssl usern	nap		
	showldapssl defau	ltrole		
	showldapssl serve	er [-i n]		
	showldapssl -h			
DESCRIPTION	showldapssl displays the LDAP over SSL configuration and diagnostic messages.			
Privileges	You must have useradm privileges to run this command.			
	Refer to setprivileges(8) for more information.			
OPTIONS	The following options are supported:			
	U is	Displays diagnostic messages in real time. When this option is used, the command does not terminate. Each diagnostic message s displayed when it is registered. To stop the real-time display, press [Ctrl]+[C] key.		
		Displays usage statement. When used with other options or operands, an error occurs.		

	-i n	without ar	dex marker, value 1 - 5. When executed without -i or ny value for -i, the system behaves in the following ding to the assigned operand.
			erdomain ssively searches index marker 1 to 5.
		cert Displa server	ys the server certificate of the primary LDAP over SSL
		server Displa server	ys the configuration of the primary LDAP over SSL
	-v		rerbose output. Used only with the cert operand to e full certificate.
	-C	Appends t	to end of output the number of records in the log.
	-E	end_record_	he last record number to display, where _ <i>number</i> can be any record number in the log. Use -C he number of records in the log.
	-M	Displays t	ext one screen at a time.
	-S	can be any	he first record to display, where <i>start_record_number</i> record number in the log. Use -C to obtain the records in the log.
OPERANDS	The following op	erands are s	supported:
	cert		Display current server certificates.
			Displays the primary LDAP over SSL server when -i is omitted. Displays the alternate LDAP over SSL server when -i is specified.
	log		Display diagnostic messages.
	group adminis	trator	Display current group configurations.
	group operato	r	Display current group configurations.
	group custom		Display current group configurations.
	userdomain		Display current userdomain settings.

showldapssl(8)

usermap	Display current user mapping settings.
defaultrole	Display current defaultrole setting.
server	Display current LDAP over SSL server settings.
	Displays the primary LDAP over SSL server when -i is omitted. Displays the alternate LDAP over SSL server when -i is specified.

EXAMPLES

EXAMPLE 1 Displays the current state of LDAP over SSL.

```
XSCF> showldapssl
usermapmode: enabled
state: enabled
strictcertmode: enabled
timeout: 4
logdetail: none
```

EXAMPLE 2 Displays certificate information for the primary LDAP over SSL server.

XSCF> showldapssl cert

```
Primary Server:
certstatus = certificate present
issuer = C=US, ST=California, L=San Diego, O=aCompany,
OU=System Group, CN=John User serial number = 0 (00000000)
subject = C=US, ST=California, L=San Diego, O=aCompany,
OU=System Group, CN=John User serial number = 0 (00000000)
valid from = Apr 18 05:38:36 2013 GMT
valid until = Apr 16 05:38:36 2023 GMT
version = 3 (0x02)
```

EXAMPLE 3 Displays specified diagnostic messages.

XSCF> showldapssl log -S 5 -E 10

```
Thu Sep 2 01:43 2013 (LdapSSL): -error- authentication status: auth-ERROR
Thu Sep 2 01:44 2013 (LdapSSL): -error- authentication status: auth-ERROR
Thu Sep 2 01:47 2013 (LdapSSL): -error- authentication status: auth-ERROR
Thu Sep 2 01:51 2013 (LdapSSL): -error- authentication status: auth-ERROR
Thu Sep 2 01:52 2013 (LdapSSL): -error- authentication status: auth-ERROR
Thu Sep 2 01:55 2013 (LdapSSL): -error- authentication status: auth-ERROR
```

	EXAMPLE 4 Displays configuration for administrator group 3.
	XSCF> showldapssl group administrator -i 3 Administrator Group 3
	name: CN=pSuperAdmin,OU=Groups,DC=sales,DC=company,DC=com
	EXAMPLE 5 Displays alternate LDAP over SSL server 1 setting. A port number of 0 indicates that the default port for LDAP over SSL is used.
	XSCF> showldapssl server -i 1 Alternate Server 1 address: (none) port: 0
	EXAMPLE 6 Displays the optional user mapping settings.
	<pre>XSCF> showldapssl usermap attributeInfo: (&(objectclass=person)(uid=<username>)) binddn: cn=Manager,dc=company,dc=com bindpw: Set searchbase: ou=people,dc=company,dc=com</username></pre>
EXIT STATUS	The following exit values are returned:
	0 Successful completion.
	>0 An error occurred.

NAME	showlocator - Displays the status of the CHECK LED on the operation panel.		
SYNOPSIS	showlocator [-a -b bb_id]		
	showlocator -h		
DESCRIPTION	showlocator is a command to display the blinking status of the CHECK LEDs of the operation panels mounted in SPARC M12/M10 Systems chassis and crossbar boxes (XBBOXs).		
	Any of the follow	ving statuses is displayed.	
	Off (Off)	Indicates that it is normal, the input power is being off, or the power fails.	
	Blinking (Blinking)	Indicates that it is a chassis subject to maintenance.	
	On (Lighted)	Indicates that an abnormality is detected.	
Privileges	To execute this co	ommand, any of the following privileges is required.	
	useradm,plata	dm,platop,fieldeng	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a Displays the statuses of all CHECK LEDs connected currently.		
	-ъ <i>bb_id</i>	Displays the status of the CHECK LEDs of the SPARC M12/M10 systems chassis and crossbar boxes corresponding to the specified <i>bb_id</i> . If omitted, the status of the CHECK LED of the chassis itself is displayed.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXTENDED DESCRIPTION	You can set the blinking status of CHECK LED by using setlocator(8).		
EXAMPLES	EXAMPLE 1 Display the status of CHECK LED of BB-ID 10.		
	XSCF> showlocator -b 10 BB#10: Locator LED status: Blinking		

EXAMPLE 2 Display the statuses of all CHECK LEDs. XSCF> showlocator -a XB-Box#80 : Locator LED status: Blinking : BB#00 : Locator LED status: Blinking BB#01 : Locator LED status: Off BB#02 : Locator LED status: On : EXIT STATUS The following exit values are returned. 0 Indicates normal end. Indicates error occurrence. >0 setlocator(8) SEE ALSO

NAME	showloginlockout - Displays the time set in the lockout function of the user account.			
SYNOPSIS	showloginlockout			
	showloginlockout -h			
DESCRIPTION	showloginlockout is a command to display the time by minutes when login is prohibited after failing in login three times in a row.			
Privileges	To execute this command, useradm privilege is required.			
	For details on user privileges, see setprivileges(8).			
OPTIONS	The following options are supported.			
	-h Displays the usage. Specifying this option with another option or operand causes an error.			
EXTENDED DESCRIPTION	The user can attempt login three times in a row. If the third attempt fails, login is prohibited for the time set by setloginlockout(8). showloginlockout displays the set lockout time by minutes.			
	If the set lockout time elapses, attempt to log in is allowed again.			
	EXAMPLE 1 Display the timeout time of lockout.			
EXAMPLES	EXAMPLE 1 Display the timeout time of lockout.			
EXAMPLES	EXAMPLE 1 Display the timeout time of lockout. XSCF> showloginlockout 90 minutes			
EXAMPLES EXIT STATUS	XSCF> showloginlockout			
	XSCF> showloginlockout 90 minutes			
	XSCF> showloginlockout 90 minutes The following exit values are returned.			
	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end.			
EXIT STATUS	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.			
EXIT STATUS	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.			
EXIT STATUS	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.			
EXIT STATUS	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.			
EXIT STATUS	XSCF> showloginlockout 90 minutes The following exit values are returned. 0 Indicates normal end. >0 Indicates error occurrence.			

showloginlockout(8)

NAME	showlogs - Displays the specified log.		
SYNOPSIS	showlogs [-t <i>time</i> [-T <i>time</i>]] [-v -V -S] [-r] [-M] error		
	showlogs [-t <i>time</i> [-T <i>time</i>]	-p timestamp][-v][-r][-M] event	
	<pre>showlogs [-t time [-T time]]</pre>	[-r][-M]power	
	<pre>showlogs {-a -b bb_id} [-t</pre>	<i>time</i> [-T <i>time</i>]] [-T] [-M] env	
	showlogs [-r] [-M] monitor		
	<pre>showlogs -p ppar_id [-t time</pre>	[-T <i>time</i>]][-r][-M]{console ipl panic}	
	showlogs -h		
DESCRIPTION	showlogs is a command to d	isplay the specified log.	
	The logs are displayed in chro following logs can be specified	onological order of time stamps by default. The d for each unit of collection.	
	 System unit 		
	 Error log (Scan logs may be included.) 		
	Power logEvent log		
	Event logMonitoring log		
	 SPARC M12/M10 systems 	chassis	
	 Temperature history 		
	 Physical partition (PPAR) u 	init	
	 Console message log 		
	 Panic message log 		
	 IPL message log 		
Privileges	To execute this command, any of the following privileges is required.		
	 Error log, event log, temperature history, monitoring log 		
	platadm, platop, fieldeng		
	 Power log 		
	platadm,platop, En fieldeng	nables execution for all PPARs.	
	pparadm, pparmgr Enables execution for PPARs for which you ha administration privilege.		

	 Console message log, panic message log, IPL message log 		
	platadm,pla fieldeng	atop,	Enables execution for all PPARs.
	pparadm, ppa pparop	armgr,	Enables execution for PPARs for which you have access privilege.
	 Scan log fieldeng 		
	For details on us	ser privile	eges, see setprivileges(8).
OPTIONS	The following op	ptions are	supported.
	-a		ssis on the system are subject. This can be specified for operature history.
	-b bb_id		es only one BB-ID to display the log. You can specify any following values for <i>bb_id</i> .
		For SPA	ARC M12-1/M12-2/M10-1/M10-4: 0
		For SPA	ARC M12-2S/M10-4S: an integer from 0 to 15
		For cro	ssbar box: an integer from 80 to 83
	-h		and causes an error.
	-M	Display	ys text one screen at a time.
	-p ppar_id	the con log. De	es a single PPAR-ID to display. This can be specified for sole message log, panic message log, and IPL message pending on the system configuration, you can specify an from 0 to 15 for <i>ppar_id</i> .

-₽ timestamp	If the log is displayed alone, specify the time stamp of the log. This can be specified for the error log and event log.
	<i>timestamp</i> is specified in any of the following formats.
	yyyy-mm-dd,hh:mm:ss
	The value is specified in the year-month- day,hour:minute:second format.
	mm/dd/yy,hh:mm:ss
	The value is specified in the month/day/ year,hour:minute:second format.
	Monddhh:mm:ssyyyy
	The value is specified in the month- name,day,hour:minute:second,year format.
-r	Displays logs in reverse chronological order of time stamps. By default, logs are displayed in chronological order of time stamps.
-S	Displays the scan log attached to an error log. Only the users with fieldeng privilege can specify it. It cannot be specified with the -v or -V option.

-t time	Specifies the starting date and time for specifying the display range of logs. Any of the following specification formats is applied.
	<pre>yyyy-mm-dd,hh:mm The value is specified in the year-month-day,hour:minute format. mm/dd/yy,hh:mm The value is specified in the month/day/year,hour:minute format. Monddhh:mmyyyy The value is specified in the month- name,day,hour:minute,year format. yyyy-mm-dd,hh:mm:ss</pre>
	The value is specified in the year-month- day,hour:minute:second format. <i>mm/dd/yy,hh:mm:ss</i> The value is specified in the month/day/ year,hour:minute:second format. <i>Monddhh:mm:ssyyyy</i> The value is specified in the month- name,day,hour:minute:second,year format.
	Even if it is specified with the $-r$ option, the specifications of the $-t$ and $-T$ option will never be reversed. It cannot be used for monitoring logs.

	-т time	Specifies the ending date and time for specifying the display range of logs. Any of the following specification formats is applied.
		yyyy-mm-dd,hh:mm
		The value is specified in the year-month-day,hour:minute format. mm/dd/yy,hh:mm
		The value is specified in the month/day/year,hour:minute format.
		Monddhh:mmyyyy
		The value is specified in the month- name,day,hour:minute,year format. <i>yyyy-mm-dd,hh:mm:ss</i>
		The value is specified in the year-month-
		day,hour:minute:second format. mm/dd/yy,hh:mm:ss
		The value is specified in the month/day/ year,hour:minute:second format. Monddhh:mm:ssyyyy
		The value is specified in the month- name,day,hour:minute:second,year format.
		Even if it is specified with the -r option, the specifications of the -t and -T option will never be reversed. It cannot be used for monitoring logs.
	-v	Displays detailed information. In addition to normal display, the detailed diagnosis code (Diagnostic Code) is displayed. It cannot be specified with the -V or -S option. This can be specified for the error log and event log.
	-V	Displays more detailed information. If the machine administration detail log information, the PCI card information, and the I/O error fault log information have been collected, those are displayed in addition to the information displayed by the $-v$ option. They may not be collected depending on the type of error event. It cannot be specified with the $-v$ or $-s$ option. This can be specified for the error log.
OPERANDS	The following op	erands are supported.
	error	Displays the error log. (Scan logs may be included.)
	event	Displays the event log.
	power	Displays the power log.

env	Displays the temperature history.
monitor	Displays the monitoring log.
console	Displays the console message log.
ipl	Displays the IPL message log.
panic	Displays the panic message log.

EXTENDED DESCRIPTION

The upper limit on the number of characters displayed for a log on a single line of the console message log (console) is 2,047 characters. The part exceeding this upper limit is not displayed.

Each log is displayed in the following format.

Error log
 Default

```
If -v option is specified
```

If the -V option is specified

NAME	showmonitorlog - Displays the contents of the monitoring message log in real time.		
SYNOPSIS	showmonitorlog		
	showmonitorlog -h		
DESCRIPTION	showmonitorlog is a command to display the contents of the monitoring message log in real time. It is similar to "tail -f."		
	If showmonitorlog is executed, the command is not terminated to display the monitoring message log and the XSCF shell is occupied. If a message is registered in a monitoring message log, the content is displayed. If the command is executed, nothing is displayed until a monitoring log is registered next time.		
	To terminate real-time display, press [Ctrl]+[C] key.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	EXAMPLE 1 Display the contents of the monitoring message log in real time.		
	<pre>XSCF> showmonitorlog Jun 23 12:17:18 PAPL-SERVER Warning: /BB#0/CMUL,/UNSPECIFIED:SCF:SCF SPI FMEM access error Jul 10 14:13:32 PAPL-SERVER Alarm: /BB#0/CMUU:SCF:Critical low voltage error Jul 11 13:40:20 PAPL-SERVER Information: /BB#0/XBU#0:ANALYZE:CPU-XB interface correctable error Jul 11 13:46:21 PAPL-SERVER Notice: /FIRMWARE,/BB#0/CMUL:SCF:SCF process down detected Jul 11 15:31:54 PAPL-SERVER Event: SCF:System powered on .</pre>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		

showmonitorlog(8)

NAME	shownameserver - Displays the name servers and search paths set in the XSCF network.
SYNOPSIS	shownameserver
	shownameserver -h
DESCRIPTION	shownameserver is a command to display the list of the IP addresses of the name server and search paths set currently in the XSCF network.
Privileges	No privileges are required to execute this command.
	For details on user privileges, see setprivileges(8).
OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXTENDED DESCRIPTION	You can set the name servers and search paths of the XSCF network by using setnameserver(8).
EXAMPLES	EXAMPLE 1 Display the name servers set currently in the XSCF network. We take as an example the case that three name servers and five search paths are set.
	XSCF> shownameserver nameserver 192.168.1.2 nameserver 10.18.108.10 nameserver 10.24.1.2 search example1.com search example2.com search example3.com search example5.com
	EXAMPLE 2 Display the name servers set currently in the XSCF network. We take as an example the case that no name server or search path is set.
	XSCF> shownameserver nameserver search
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.

SEE ALSO setnameserver(8)

NAME	shownetwork - Displays the information of the network interface set in the XSCF.		
SYNOPSIS	shownetwork [-M] [-a -i <i>interface</i>]		
	shownetwork -h		
DESCRIPTION	shownetwork is a command to display the information of the network interface set currently in the XSCF.You can display the information of the specified network interface or all network		
	interfaces. The fo	ollowing information is displayed.	
	xscf# <i>x-y</i>	XSCF network interface name	
	HWaddr	MAC address (Displayed in hexadecimal)	
	inet addr	IP address	
	Bcast	Broadcast	
	Mask	Netmask	
	UP/DOWN	Whether the network interface is valid	
Privileges	No privileges are	e required to execute this command.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-a	Displays the information set in all XSCF network interfaces.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-i	Displays the status of the current XSCF network.	
	-M	Displays text one screen at a time.	

OPERANDS	The following operands are supported.		
	interface	Specifies the network interface to be displayed. You can specify any of the following depending on the system configuration. If it is specified with the -a option, it becomes invalid.	
		■ For SPARC M12-2S/M10-4S (with crossbar box)	
		xbbox#80-lan#0	XBBOX#80-LAN#0
		xbbox#80-lan#1	XBBOX#80-LAN#1
		lan#0	Take-over IP address of XBBOX#80-LAN#0 and XBBOX#81-LAN#0
		xbbox#81-lan#0	XBBOX#81-LAN#0
		xbbox#81-lan#1	XBBOX#81-LAN#1
		lan#1	Take-over IP addresses of XBBOX#80-LAN#1 and XBBOX#81-LAN#1
		 For SPARC M12-2S/M10-4S (without crossbar box) 	
		bb#00-lan#0	BB#00-LAN#0
		bb#00-lan#1	BB#00-LAN#1
		lan#0	Take-over IP addresses of BB#00- LAN#0 and BB#01-LAN#0
		bb#01-lan#0	BB#01-LAN#0
		bb#01-lan#1	BB#01-LAN#1
		lan#1	Take-over IP addresses of BB#00- LAN#1 and BB#01-LAN#1
		■ For SPARC M12-1/M12-2/M10-1/M10-4	
		bb#00-lan#0	BB#00-LAN#0
		lan#0	Abbreviated form of bb#00-lan#0
		bb#00-lan#1	BB#00-LAN#1
		lan#1	Abbreviated form of bb#00-lan#1
EXTENDED DESCRIPTION	 The take-over IP address means IP addresses which can be used without switch of XSCF recognized in multi-XSCF configuration. If each LAN port of an active XSCF unit is set in lan#0 and lan#1, you can access them by the names, lan#0 and lan#1. For SPARC M12-1/M12-2/M10-1/M10-4, lan#0 is fixed to bb#0-lan#0 and lan#1 is fixed to bb#0-lan#1. For SPARC M12-2S/M10-4S, if the take-over IP address is disabled by setnetwork(8), nothing is displayed even with the take-over IP address specified by shownetwork. 		

```
You can set the XSCF network interface by using setnetwork(8).
EXAMPLES
              EXAMPLE 1 Display the information set in LAN#1 of XBBOX#80.
                XSCF> shownetwork xbbox#80-lan#1
                xbbox#80-lan#1
                          Link encap:Ethernet HWaddr 00:00:00:12:34:56
                          inet addr:192.168.10.11 Bcast: 192.168.10.255
                Mask:255.255.255.0
                          UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
                          RX packets:54424 errors:0 dropped:0 overruns:0 frame:0
                          TX packets:14369 errors:0 dropped:0 overruns:0 carrier:0
                          collisions:0 txqueuelen:1000
                          RX bytes:20241827 (19.3 MiB) TX bytes:2089769 (1.9 MiB)
                          Base address:0x1000
              EXAMPLE 2 Display the information set in LAN#0 of XBBOX#80.
                XSCF> shownetwork xbbox#80-lan#0
                xbbox#80-lan#0
                Link encap:Ethernet HWaddr 00:00:00:12:34:56 E0:00:C4:00:8B
                          inet addr: 192.168.11.10 Bcast: 192.168.11.255
                Mask:255.255.255.0
                          UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
                          RX packets:54424 errors:0 dropped:0 overruns:0 frame:0
                          TX packets:14369 errors:0 dropped:0 overruns:0 carrier:0
                          collisions:0 txqueuelen:1000
                          RX bytes:12241827 (11.3 MiB) TX bytes:1189769 (0.9 MiB)
                          Base address:0x1000
              EXAMPLE 3 Display the information set in the take-over IP address of LAN#0.
                XSCF> shownetwork lan#0
                lan#0
                          Link encap:Ethernet HWaddr 00:00:00:12:34:56
                          inet addr:192.168.1.10 Bcast:192.168.1.255
                Mask:255.255.255.0
                          UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
                          Base address:0xe000
              EXAMPLE 4 Display the status of the XSCF network.
                XSCF> shownetwork -i
                Active Internet connections (without servers)
                Proto Recv-Q Send-Q Local Address Foreign Address
                                                                                   State
                          0
                             0 xx.xx.xx.xx:telnet xxxx:1617
                                                                             ESTABLISHED
                tcp
              EXAMPLE 5 For SPARC M10-4S (without crossbar box), display the set information.
                XSCF> shownetwork -a
                bb#00-1an#0
                          Link encap:Ethernet HWaddr 00:00:00:12:34:56
```

```

NAME	shownotice - Displays copyright and license information for the XSCF Control Package (XCP)			
SYNOPSIS	<pre>shownotice [-c {copyright license}]</pre>			
	shownotice -h			
DESCRIPTION	The shownotice is a command to display by page the copyright and, if available, license files for the XCP. When used without an option, shownotice displays copyright information and any available license information. You can display only the copyright or the license file by specifying the -c option.			
Privileges	No privileges are required to run this command.			
	Refer to setprivileges(8) for more information.			
OPTIONS	The following options are supported:			
	-c {copyright license}			
	Specifies for display by page either the copyright file or the license file for the XCP.			
	copyright			
	Specifies for display only the copyright file.			
	license Specifies for display only the license file, if a license file is available for your platform. If the license file for your platform is not available for the shownotice command, the license argument is not supported.			
	-h			
	Displays usage statement. When used with other options or operands, an error occurs.			
EXAMPLES	EXAMPLE 1 Display Only Copyright Information			
	XSCF> shownotice -c copyright [Copyright text displays.]			
	EXAMPLE 2 Display Copyright and License Information			
	XSCF> shownotice [Copyright text displays.] [License text displays (if available).]			

EXIT STATUS	The following exit values are returned:		
	0	Indicates normal end.	
	>0	Indicates error occurrence.	

I

NAME	showntp - Disp	ays the NTP informa	tion set in the XSCF network.
SYNOPSIS	showntp {-1 -a address -s -m}		
	showntp -h		
DESCRIPTION	showntp is a con network.	mmand to display the	e NTP information set currently in the XSCF
	The following in	formation can be disj	played.
	■ NTP server re	gistered in the XSCF	network
	 Synchronizati 	on status with the up	per NTP servers
	 Whether NTP 	service is provided t	to the client
		set in the XSCF netw	
	-	preferred server is spe	
		of the local clock set	
	 Enable/disable configuration status of DNS round robin 		
Privileges	No privileges are required to execute this command.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays all NTP se	ervers set currently in the XSCF network.
	-h	Displays the usage or operand causes	. Specifying this option with another option an error.
	-1	Displays whether i	t is synchronized with the NTP server
	-m		he preferred server is specified (prefer) and e local clock (localaddr).
		In prefer, either o	of the following is displayed.
		on off	The preferred server is specified. The preferred server is not specified.
			least significant byte of the clock address of 127.1.u is displayed by a figure from 0 to 3.
	-s	Displays the stratu	m value set in XSCF.

OPERANDS	The following operands are supported.				
	address Specifies the IP address or host name of the NTP server to be displayed. If the -a option is specified, it becomes invalid.				
	To specify them by the IP address, <i>address</i> can be specified in a format using four sets of integers separated by periods (.).				
	xxx.xxx.xxxSpecifies an integer from 0 to 255. This can be specified using zero suppression.				
	To specify them by the host name, specify <i>address</i> within 64 characters in a format separating the label elements by periods (.). For the label element, you can use alphanumeric characters and hyphens (-). However, make the specification using an alphabetic character for the beginning, and an alphanumeric character for the end of the element. (Based on RFC 1034.) Depending on the DNS server, the server name needs to be name-resolvable.				
EXTENDED DESCRIPTION	 If the preferred server is not specified, there is no prefer information in the NTP server displayed by showntp. 				
	 You can set the NTP server of the XSCF network by using setntp(8). If showntp is executed after executing setntp(8), the contents set by setntp(8) are displayed. To confirm the settings information of the NTP currently in operation, execute this command with the -1 option. 				
EXAMPLES	EXAMPLE 1 Display all registered NTP servers. If -m prefer=off is set by setntp, the characters prefer are not displayed.				
	XSCF> showntp -a client : enable server : disable				
	server ntp1.example.com prefer server ntp2.example.com				
	EXAMPLE 2 Confirm synchronization with the NTP server and display the result.				
	XSCF> showntp -1 remote refid st t when poll reach delay offset jitter				
	*192.168.0.27 192.168.1.56 2 u 27 64 377 12.929 -2.756 1.993 +192.168.0.57 192.168.1.86 2 u 32 64 377 13.030 2.184 94.421 127.127.1.0 .LOCL. 5 1 44 64 377 0.000 0.000 0.008				

	EXAMPLE 3 Display the stratum value set in the XSCF network .			
	XSCF> showntp -s stratum : 5			
	KAMPLE 4 Display whether the preferred server is specified and the clock address of the local clock.			
	XSCF> showntp -m prefer : on localaddr : 0			
	EXAMPLE 5 Confirm synchronization if the NTP server is not synchronized with the upper NTP servers and the service is not provided to the client.			
	XSCF> showntp -1 NTP is unavailable.			
	EXAMPLE 6 Display whether DNS round robin is enabled in registered NTP servers.			
	XSCF> showntp ntp1.example.com pool ntp1.example.com			
	EXAMPLE 7 Display all NTP servers. In this example, DNS round robin has been enabled in the first NTP server.			
	XSCF> showntp -a client : enable server : disable			
	<pre>pool ntp1.example.com server ntp2.example.com prefer</pre>			
EXIT STATUS	The following exit values are returned.			
	0 Indicates normal end.			
	>0 Indicates error occurrence.			
SEE ALSO	setntp(8), setnameserver(8)			

showntp(8)

NAME	showpacketfilters - Displays the IP packet filtering rules set in the XSCF network.			
SYNOPSIS	showpacketfilters {-a -1} [-M]			
	showpacketfilters -h			
DESCRIPTION	showpacketfilters is a command to displays the IP packet filtering rules set in the XSCF network.			
Privileges	No privileges are	required to execute this command.		
	For details on us	er privileges, see setprivileges(8).		
OPTIONS	The following op	tions are supported.		
	-a	Displays the IP packet filtering rules set by setpacketfilters(8). However, the IP packet filtering rules set by -c ipmi_port are not displayed.		
	 -h Displays the usage. Specifying this option with another option or operand causes an error. 			
	-1 Displays the IP packet filtering rules set by setpacketfilters(8) in the output format of the iptables command.			
	-М	Displays text one screen at a time.		
EXTENDED DESCRIPTION	You can set the IP packet filtering rules used in the XSCF network by using setpacketfilters(8).			
EXAMPLES	EXAMPLE 1 For SPARC M10-4S (with crossbar box), display the IP packet filtering rules set in the XSCF network.			
	<pre>XSCF> showpacketfilters -a -s 172.16.0.0/255.255.0.0 -i xbbox#80-lan#0 -j DROP -s 172.16.0.0/255.255.0.0 -i xbbox#81-lan#0 -j DROP -s 10.10.10/255.255.255.255 -j DROP -s 192.168.100.0/255.255.255.0 -i xbbox#80-lan#1 -j ACCEPT -s 192.168.100.0/255.255.255.0 -i xbbox#81-lan#1 -j ACCEPT -i xbbox#80-lan#1 -j DROP -i xbbox#81-lan#1 -j DROP</pre>			
	EXAMPLE 2 For SPARC M10-4S (with crossbar box), display the operation status of the IP packet filtering rules of the XSCF network.

NAME	showpasswordpolicy - Displays the current password policy setting.		
SYNOPSIS	showpasswordpolicy		
	showpasswordpolicy -h		
DESCRIPTION	showpasswordpolicy is a command to display the password policy setting.		
	The pam_cracklib module, date of the effective period, and number of the passwords stored in the password history are included.		
Privileges	To execute this command, useradm privilege is required.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXAMPLES	EXAMPLE 1 Display the password policy setting.		
	XSCF>showpasswordpolicyMindays:0Maxdays:99999Warn:7Inactive:-1Expiry:0Retry:3Difok:10Minlen:9Dcredit:1Lcredit:1Ocredit:1Remember:3		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	showpciboxdio - Displays each PCI slot setting of whether to enable the direct I/O function for a PCI card mounted in the PCI expansion unit for the SPARC M12-2/M12-2S/M10-4/M10-4S.		
SYNOPSIS	showpciboxdio [-a -b	<pre>bb_id] [-M] all</pre>	
	showpciboxdio [-a -b	bb_id] [-M] slot_no	
	showpciboxdio -h		
DESCRIPTION		ommand to display the enable/disable setting of the direct CI card mounted in the PCI expansion unit for the SPARC M10-4S.	
	showpciboxdio is not	available for SPARC M12-1/M10-1.	
	For SPARC M12-1/M10-1, the setpciboxdio setting need not be made. The direct I/O function can be used simply by connecting the PCI expansion unit to SPARC M12-1/M10-1.		
Privileges	To execute this command, any of the following privileges is required.		
	platadm, platop, fieldeng		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the setting information of the direct I/O function for all SPARC M12-2/M12-2S/M10-4/M10-4S. When omitting both -a and -b options, the setting information of the current SPARC M12-2/M12-2S/M10-4/M10-4S is displayed.	
	-b bb_id	Specifies the BB-ID of the SPARC M12-2/M12-2S/M10-4/ M10-4S whose enable/disable setting of the direct I/O function is to be displayed. You can specify any of the following values for <i>bb_id</i> .	
		For SPARC M12-2/M10-4: 0	
	For SPARC M12-2S/M10-4S (without crossbar box): an integer from 0 to 3		
	For SPARC M12-2S/M10-4S (with crossbar box): an integer from 0 to 15		
	When omitting both -a and -b options, the setting information of the current SPARC M12-2/M12-2S/M10-4/M10-4S is displayed.		

showpciboxdio(8)

	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	
OPERANDS			
	all	Displays the settings of all PCI slots on the specified SPARC M12-2/M12-2S/M10-4/M10-4S. This operand cannot be used with the <i>slot_no</i> at the same time.	
	slot_no	Specifies the number of a PCI slot to be displayed. An integer 0- 10 can be specified in no particular order. Plural slot numbers can be specified at the same time by inserting space characters. This operand cannot be used with the all at the same time.	
EXTENDED DESCRIPTION		lio cannot be executed for any crossbar box. And omitting –a and with an error when operating on the crossbar box.	
	0	d settings will be ignored when 8-10 is specified for the slot ARC M12-2S/M10-4S.	
	When the direct I/O function setting is changed by setpciboxdio(8), the logical domain configuration of the PPAR in which the target PSB of the SPARC M12-2/M12-2S/M10-4/M10-4S was added may be reset to factory-default. In this case, the OpenBoot PROM environment variables may also be initialized on SPARC M10-4/M10-4S. On the SPARC M12-2/M12-2S, the OpenBoot PROM environment variables of the control domain are not initialized. For details, see the latest <i>Product Notes</i> for your servers.

NAME	showpcl - Displays the physical partition (PPAR) configuration information (PCL) that is currently set.			
SYNOPSIS	showpcl [-v] -	-a [-M]		
	showpcl [-v] -p <i>ppar_id</i> [[-1 <i>lsb</i>]]			
	showpcl -h			
DESCRIPTION	showpcl is a con	nmand to display th	ne PCL set by setpcl(8).	
	PCL is hardware resource information which can be set in PPAR or logical system boards (LSB) composing PPAR.			
		f system boards reco ger from 00 to 15 fe	ognized by Hypervisor. It is indicated by an or each PPAR.	
	The physical sysmounted as hard		ans the boards recognized by system and	
	showpcl comma	and can display the	following information in PCL.	
	PPAR-ID	PPAR ID		
	LSB	LSB number. An ii	nteger from 00 to 15 is displayed.	
	PSB	PSB number corresponding to LSB. This is displayed in the format below.		
		xx-y: xx y	BB-ID which is an integer from 00 to 15 It is fixed to 0	
	Status	Operating status of	of PPAR. Any of the following is displayed.	
		Powered Off In the power-off status Initialization Phase In the status in which POST is in operation Initialization Complete In the status in which POST is completed Running In the status in which POST is completed and Oracle Sola is running Hypervisor Abort The status between occurrence of Hypervisor Abort and PPAR reset		

showpcl(8)

	If the -v option is specified, the following information is added.				
	Cfg-policy	0	e in the case that an abnormality is detected in re diagnosis. Any of the following is displayed.		
		FRU	Degradation occurs by part such as CPU and memory (Default).		
		PSB	Degrades by PSB.		
		System	Degrades by PPAR.		
	No-Mem		the logical domain use the memory mounted in following is displayed.		
		True	Does not allow use of memory.		
		False	Allows use of memory (Default).		
	No-IO		he logical domain use the I/O devices mounted he following is displayed.		
		True	Does not allow use of I/O devices.		
		False	Allows use of I/O devices (Default).		
Privileges	To execute this co	execute this command, any of the following privileges is required.			
	platadm,plato fieldeng	p, Enables exe	cution for all PPARs.		
	pparadm, pparm pparop	rmgr, Enables execution for PPARs for which you have access privilege.			
	For details on us	ser privileges, see setprivileges(8).			
OPTIONS	The following op	otions are supported			
	-a	Displays the inform	mation of all PPARs.		
	-h	Displays the usage or operand causes	e. Specifying this option with another option an error.		
	-l lsb	Specifies the LSB number to be displayed. <i>lsb</i> is specified by an integer from 0 to 15. You can specify multiple values for the -1 option by separating them with spaces. If the -1 option is omitted, all LSBs in PPAR are subject.			
	-M	Displays text one s	screen at a time.		
	-p ppar_id		R-ID to be displayed. Depending on the system integer from 0 to 15 is displayed for <i>ppar_id</i> .

EXAMPLE 4 Display the detailed information of the PCL for PPAR.

NAME	showpowercapping - Displays the status of power capping.						
SYNOPSIS	showpowercapping						
	showpowercapping -h						
DESCRIPTION	showpowercapping is a command to display the status of power capping of the system.						
	The following statuses are displayed.						
	 Whether the power capping function is enabled or disabled 						
	Displays whether to enable/disable the power capping of the system.						
	 Upper limit of power consumption 						
	 Upper limit of power consumption (Wattage) 						
	Displays the upper limit of power consumption by wattage.						
	 Upper limit of power consumption (%) 						
	Displays the upper limit of power consumption by percentage.						
	Converts the minimum power consumption value (0%) and maximum power consumption value (100%) of the system to the upper limit power value (watt).						
	If the upper limit of the power consumption of setpowercapping(8) is set by wattage specification, no value is displayed.						
	 Window time for exceeding the upper limit 						
	Displays the window time (second) until recognition as violation after the pow consumption value of the system exceeds the upper limit of power consumpti						
	 System operation at the time of violation 						
	Displays the system operation (display of warning message, shutdown processing, and forcible power-off processing) when the window time for exceeding the upper limit elapsed while the power consumption value of the system exceeds the upper limit of power consumption.						
	You can confirm the minimum power consumption value and maximum power consumption value of the system by showenvironment(8).						
Privileges	To execute this command, any of the following privileges is required.						
	useradm, platadm, platop, fieldeng						
	For details on user privileges, see setprivileges(8).						

OPTIONS	The following options are supported.
	-h Displays the usage. Specifying this option with another option or operand causes an error.
EXAMPLES	EXAMPLE 1 Display the status of power capping of the system. (If the upper limit of power consumption of setpowercapping(8) is set by percent specification)
	<pre>XSCF> showpowercapping activate_state :enabled powerlimit :25% timelimit :30 violation_actions :none XSCF></pre>
	EXAMPLE 2 Display the status of power capping of the system. (If the upper limit of power consumption of setpowercapping(8) is set by wattage specification)
	<pre>XSCF> showpowercapping activate_state :enabled powerlimit :1000w timelimit :300 violation_actions :poff XSCF></pre>
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
SEE ALSO	<pre>setpowercapping(8), showenvironment(8)</pre>

NAME	showpowerschedule - Displays the schedule operation information.					
SYNOPSIS	<pre>showpowerschedule {-p ppar_id -a} -m state</pre>					
	showpowersched	<pre>dule {-p ppar_id -a} -m list [-v] [-M]</pre>				
	showpowersched	dule -h				
DESCRIPTION	showpowersche	edule is a command to display the schedule operation information.				
	The types of the o	displayed contents are the following two.				
	 Information re 	egarding the schedule operation settings				
	 PPAR-ID 					
		hedule operation is enabled/disabled

NAME	showpowerupdelay - Displays the warm-up time and wait time for air conditioning of the system that is currently set.				
SYNOPSIS	showpowerupde	lay			
	showpowerupde	lay -h			
DESCRIPTION		lay is a command to display the warm-up time and wait time for of the system that is currently set.			
	The following co	ntents are displayed.			
	warmup time	Warm-up time. The setting value of each physical partition (PPAR) is displayed.			
	wait time	Wait time for air conditioning			
		Note – The wait time for air conditioning is not supported at SPARC M12/M10.			
Privileges	To execute this co	ommand, any of the following privileges is required.			
	platadm, platop, pparadm, pparmgr, pparop, fieldeng				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-h	Displays the usage. Specifying this option with another option or operand causes an error.			
EXTENDED DESCRIPTION	You can set the warm-up time and wait time for air conditioning of the system by using setpowerupdelay(8).				
EXAMPLES	EXAMPLE 1 Display the warm-up time and wait time for air conditioning of the system.				
	XSCF> showpow warmup time : PPAR#00 PPAR#01 : PPAR#15 wait time :	<pre>rerupdelay :10 minute(s) :10 minute(s) :15 minute(s) 20 minute(s)</pre>

	0	Indicates normal end.			
	>0	Indicates error occurrence.			

NAME	showpparinfo - Display the resource information of the physical partition (PPAR).						
SYNOPSIS	showpparinfo -p ppar_id [-M]						
	showpparinfo -h						
DESCRIPTION	showpparinfo memory inside t	is a command to display resource information regarding CPU and he PPAR.					
	The resource info	ormation displayed by showpparinfo is as the following:					
	PPAR# Information	Resource information inside the PPAR. The following information is displayed.					
		CPU(s) Total number of CPU chips that are allotted to the PPAR.					
		CPU Cores Total number of CPU cores that are allotted to the PPAR.					
		CPU Threads Total number of CPU threads that are allotted to the PPAR.					
		Memory size (GB) Amount of memory in GB that is allotted to the PPAR.					
		CoD Assigned (Cores) Total number of CPU core activations that are allotted to the PPAR.					

CPU(s)	Information on CPUs that are mounted on the PSB, that are allotted to the PPAR. The following information is displayed.
	PID
	Allotted PPAR-ID. Displayed as an integer from 00 to 15.
	PSB
	Allotted PSB number. Displayed in the format of xx-y (where xx is the BB-ID which is an integer from 00 to 15 and y is fixed as 0).
	CPU#
	CPU chip number. Displayed as an integer from 0 to 3.
	Cores
	Total number (integer) of CPU cores under CPU chip.
	Threads
	Product of the number of CPU cores and the number of threads in each core, under CPU chip.
Memory	Information on memory that is mounted on the PSB and allotted to the PPAR.
	PID
	Allotted PPAR-ID. Displayed as an integer from 00 to 15.
	PSB
	Allotted PSB number. Displayed in the format of xx-y (where xx is the BB-ID which is an integer from 00 to 15 and y is fixed as 0).
	install size GB
	Amount of memory in GB that is allotted to the PSB.

	IO Devices	unit (CMU devices ar	J) and allot	ted to the layed. Displ	PPAR. The in ayed when I	n the CPU memory nternal on-board PPAR is powered on.
		PID				
		Allotte	ed PPAR-II	D. Displaye	d as an integ	ger from 00 to 15.
		PSB				
		Allotte (where				format of xx-y er from 00 to 15 and
		device				
			on of mou	nting and c	ategory of P	CI card is displayed.
Privileges	To execute this c	ommand, ar	ny of the fo	llowing pri	vileges is re	quired.
	platadm,plato fieldeng	op,	Enables e	xecution fo	or all PPARs.	
	pparadm, pparm	ngr,pparop	Enables e access pri		or PPARs for	which you have
	For details on us	er privileges	s, see setp	rivilege	s(8).	
OPTIONS	The following op	otions are su	pported.			
	-h		he usage. S d causes an		his option w	vith another option
	-M	Displays t	ext one scr	een at a tin	ne.	
	-p ppar_id					Depending on the eger from 0 to 15 for
EXTENDED DESCRIPTION	 Display inform is powered or 		sources tha	it are incor	porated in P	PAR when the PPAR
	 Display inform 		sources that	nt are assig	ned in a pov	vered off PPAR.

NAME	showpparmode - Displays the operation mode of the physical partition (PPAR) that is currently set.		
SYNOPSIS	showpparmode -p <i>ppar_id</i> [-v]		
	showpparmode -h		
DESCRIPTION	showpparmode is a command to display the operation mode set currently in the specified PPAR.		
	The following statuses are displayed.		
	HOST-ID	Host ID	
		If no host ID is assigned, a hyphen (-) is displayed.	
	Diagnostic Level Diagnostic level of the self-diagnosis test (POST)		
		Any of the following is displayed.	
		off min max	None Standard (default) Maximum
	Message Level	Detailed level of t	he console message of the POST diagnosis
		Any of the following is displayed.	
		none	None
		min	Limited volume
		normal	Normal volume (default)
		max	Maximum volume
		debug	Debug output
	Watchdog Reaction	Operation of logical domain (including control domain) at the time of host watchdog timeout	
		Any of the following is displayed.	
		none	None
		dumpcore	Generates panic
		reset	Resets the logical domain (default)
	Break Signal	mal Whether the break signal suppression is enabled or d	
		on	Enabled (default)
		off	Disabled

showpparmode(8)

Autoboot (Guest Domain)	Whether the guest domain autoboot is enabled or disabled when PPAR is started		
	on off	Enabled (default) Disabled	
pad	Whether the Power Aware Dispatcher function is enabled or disabled on the SPARC M12 system. Either of the following is displayed.		
	on off	Enabled (default) Disabled	
Elastic Mode	Whether the power-saving operation of CPUs or memory is enabled or disabled on the SPARC M10 system		
	off on	Disabled (default). All CPUs and memory in the system operate normally at the highest performance. Enabled. Changes the system power usage according to the utilization levels of CPUs and memory. This can reduce system power consumption.	
Power Management Policy	Whether the power-saving operation of CPUs or memory is enabled or disabled on the SPARC M12 system		
	Any of the following is displayed.		
	disabled	Disabled (default). All CPUs and memory in the system operate normally at the highest performance.	
	elastic	Enabled. Changes the system power usage according to the utilization levels of CPUs and memory. This can reduce system power consumption.	
	performance	Enabled. This can save power without much of an effect on performance because unused, idle CPUs in the system operate at slower speeds or may have entered the sleep state.	

	IOreconfigure	Whether to reconfi	gure I/O buses when PPAR is started or
	5	reset	
		Any of the followi	ng is displayed.
		true	Enabled
		false nextboot	Disabled Enabled only when the next boot
	CPU Mode	PPAR. CPU operat SPARC64 X+ funct functions when SP	operational mode that is set up in the tional mode determines whether to use tions or the SPARC64 X compatible ARC64 X+ processors are mounted. CPU consists of the auto mode and the

NAME	showpparparam - Displays the OpenBoot PROM environmental variable and the boot script of the control domain which will be set at the subsequent startup of the specified physical partition (PPAR).		
SYNOPSIS	showpparparam -p ppar_id		
	showpparparam -p ppar_id -c auto-boot		
	showpparparam	-h	
DESCRIPTION	showpparparam is a command to display the setup value of the specified physical partition's control domain's OpenBoot PROM environment variables and boot script (the script that is executed at the starting of the OpenBoot PROM), which are setup at the next start.		
	Note – When you changed the value of the environmental variable from OpenBoot PROM while the PPAR is in operation, it will not be applied to the showpparparam output. When you start up the PPAR next time, the value you changed in OpenBoot PROM will be set.		
	The following set	ting values are displayed.	
	use-nvramrc	Displays the setting value of the OpenBoot PROM environment variable use-nvramrc? of the control domain.	
	security-mode	Displays the setting value of the OpenBoot PROM environment variable security-mode of the control domain.	
	bootscript	Displays the registered boot script.	
Privileges	To execute this co	ommand, any of the following privileges is required.	
	useradm,plata platop,fielde		
	pparadm, pparr pparop	ngr, Enables execution for PPARs for which you have accessible privilege.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-c auto-boot	Displays the setting value of OpenBoot PROM environment variables auto-boot?.	
	-р ppar_id	Specifies the PPAR-ID to be displayed.	

A hyphen "-" will be displayed as the value of the OpenBoot PROM environment EXTENDED DESCRIPTION variables which are not set will be displayed. • As long as they are valid, the setting values that were set with setpparparam(8) will appear at "bootscript" displayed by showpparparam. Here, "as long as they are valid" means the time frame after the values are set with setpparparam(8) until OpenBoot PROM environment variables are rewritten and the registered boot script is executed, at the next startup of the PPAR. After that, nothing is displayed. As long as they are valid, the setting values that were set with setpparparam(8) will appear at "use-nvramrc" and "security-mode" displayed by showpparparam. Here, "as long as they are valid" means the time frame after the values are set with setpparparam(8) until OpenBoot PROM environment variables are rewritten and the registered boot script is executed, at the next startup of the PPAR. After that, "-" is displayed. The current value of the OpenBoot PROM environment variable appears for the "auto-boot?" value displayed when the -c auto-boot? option is specified. **EXAMPLES** EXAMPLE 1 Display the setting value OpenBoot PROM environment variables and the boot script of the control domain set in PPAR-ID 0. XSCF> showpparparam -p 0 use-nvramrc :false :none security-mode bootscript : setenv auto-boot? true setenv input-device virtual-console setenv output-device virtual-console **EXAMPLE 2** Display the setting OpenBoot PROM environment variables auto-boot? of the control domain set in PPAR-ID 0. XSCF> showpparparam -p 0 -c auto-boot auto-boot? :true EXIT STATUS The following exit values are returned. Indicates normal end. 0 >0 Indicates error occurrence. SEE ALSO setpparparam(8)

NAME	showpparprogress - Shows the detailed status of physical partitions (PPAR) in the middle of power control sequences.		
SYNOPSIS	showpparprogress -p ppar_id		
	showpparprogress -h		
DESCRIPTION	showpparprogress is a command to display the detailed status of physical partitions (PPAR) in powering on, powering off and resetting sequences.		
	The PPAR states displayed	d by the "showpparprogress" command are as follows:	
	PPAR Power On Process	ing Before powering on a PPAR	
	PPAR Power On	Powering on a PPAR has started	
	XBBOX Reset	Resetting of a crossbar box chassis has started	
	PSU On	Powering on a Power Unit (PSU) has started	
	CMU Reset Start	Resetting of a CPU Memory Unit (CMU) has started	
	XB Reset 1	Resetting of a CrossBar Unit (XBU) has started (1/3)	
	XB Reset 2	Resetting of a CrossBar Unit (XBU) has started (2/3)	
	XB Reset 3	Resetting of a CrossBar Unit (XBU) has started (3/3)	
	CPU Reset 1	Resetting of CPU has started (1/2)	
	CPU Reset 2	Reset 2 Resetting of CPU has started (2/2)	
	Reset released	Constraints on resetting has been removed	
	CPU Start	CPU has started	
	PPAR Power Off	Powering off of PPAR has started	
	CPU Stop	CPU has stopped	
	PSU Off	Powering off of PSU has started	
	PPAR reset	Resetting of PPAR has started	
	The showpparprogress shows detailed power control sequences in real time. The command terminates as soon as power control sequences comes to an end.		
Privileges	To execute this command, any of the following privileges is required.		
	useradm, platadm, platop, fieldeng	Enables execution for all PPARs.	
	pparadm, pparmgr, pparop	pparmgr, Enables execution for PPARs for which you have access privilege.	

	For details on user privileges, see setprivileges(8).	
OPTIONS	The following options are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.
	-p ppar_id	Specify the PPAR-ID, whose status is to be displayed. A <i>ppar_id</i> must be a whole number between 0 and 15, depending on the system configuration.
EXTENDED DESCRIPTION	 If a non-existendisplaying any 	nt PPAR-ID is specified, the command will be terminated without thing.
	 Execute [Ctrl]- 	+[C] to terminate the command.
	 The status of 1 command. 	ogical domains can be displayed by the showdomainstatus(8)
		already been powered on and powering off of the PPAR has not he "This PPAR is powered on" message is displayed and the erminated.
		already been powered off and powering on of the PPAR has not he "This PPAR is powered off" message is displayed and the erminated.

NAME	showpparstatus - Displays the status of the current physical partition (PPAR).					
SYNOPSIS	showpparstatus -p ppar_id					
	showpparstatus -a					
	showpparstatus -h					
DESCRIPTION	showpparstatus i	s a command to display the status of current PPAR.				
	Any of the following	g statuses is displayed for each PPAR.				
	Powered Off In the power-off status					
	Initialization Phase	In the status in which POST is in operation				
	Initialization Complete	In the status in which Power-On Self-Test (POST) is completed				
	Running	In the status in which POST is completed and Oracle Solaris is running.				
	Hypervisor Abort	The status between occurrence of Hypervisor Abort and PPAR reset				
	-	Other than those above (when PPAR is not defined)				
Privileges	To execute this command, any of the following privileges is required.					
	useradm, platadm, platop, Enables execution for all PPARs. fieldeng					
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.					
	For details on user privileges, see setprivileges(8).					
OPTIONS	The following optio	ns are supported.				
	-a D	isplays the statuses of all accessible PPARs.				
	 -h Displays the usage. Specifying this option with another option or operand causes an error. 					
	-p <i>ppar_id</i> Specifies the PPAR-ID to display the status. Depending on the system configuration, you can specify an integer from 0 to 15 for <i>ppar_id</i> .					

NAME	showremotepwrmgmt - Displays the setup of remote power management function (Remote Cabinet Interface over LAN: RCIL) of SPARC M12/M10 systems and the power status of the node.				
SYNOPSIS	showremotepwrmgmt [-a -G groupid [-N nodeid]] [-M]				
	showremotepwrmgmt -h				
DESCRIPTION		rmgmt is a command to display the management information of anagement group and the power status of the set node.			
	In showremotepwrmgmt, the following information is displayed.				
	[Remote Power Management Group Information]				
	GroupID	This is the group ID of the set remote power management group. An integer from 01 to 32 is displayed.			
	Remote Power	This is the status of	of the set remote power management group.		
	Management Status	Enable	The remote power management function enabled		
		Disable	The remote power management function disabled		
	NodeID	Node ID of the set node. An integer from 001 to 128 as a is displayed.			
	NodeType	This is the type of displayed. Master HOST HOST I/O PwrLinkBox Others	the set node. Any of the following nodes is Server device (Master HOST Node) Server device (HOST Node) I/O device (I/O Node) Remote power management box (I/O Node) Other node		
	NodeIdentName	This is the unique ID or name to identify a node. The maximur number of bytes is 32.			
	Power	This is the power status of the specified node. Either of the followings is displayed.			
		ON Power-on OFF Power-off			

PowerLinkage	This is the power-on link flag for the set node. Any of the followings is displayed			
	Disable		Remote power management disabled	
	Enable Enable(Power-On Enable(Power-Of:		Power-on/Power-off link enabled Only power-on link enabled	
	Link)		Only power-off link enabled	
	If the node is a serve	er device,	the following is performed.	
	 When the flag is "Enable," the server issues the instruction of remote power management to each node in the remote power management group. 			
 When the flag is "Enable," the of remote power management remote power management gr 				
		the node is an I/O device, remote power management box, or y other node, the following is performed.		
		eceived fro	he instruction of remote power on the server device in the remote	
Operation	This is the power-or displayed	n method.	Either of the followings is	
		Power-on Power-on	by IPMI by Wake-On LAN	
[Power Status Inf	ormation]			
any subnode. Sub	Displays the power status information of the node, and subnode(s) when there is ny subnode. Subnodes are displayed in the format as "SubNode# xx ", in which " x epresents its PPAR-ID. Either of the following is displayed for the power status.			
ON	Power-on			
OFF	Power-off			

[IPMI Information] IPMI UserName This is the IPMI user name of the controller to control the node to be linked. The maximum number of bytes is 20. This is the IP address of the IPMI port of the controller to control IPMI IP the node to be linked. This is displayed in the IPv4 format. address This is the IPMI Slave Address of the controller to control the IPMI Slave Address node to be linked. This is displayed in hexadecimal. For Slave Address, see the IPMI specification Intelligent Platform Management Interface Specification Second Generation v2.0. This is the IPMI MAC address of the controller to control the IPMI MAC Address node to be linked. Privileges To execute this command, any of the following privileges is required. platadm, platop, fieldeng For details on user privileges, see setprivileges(8).

OPTIONS	The following options are supported.		
	-a	Displays the management information of all the set remote power management groups. This is the same as that displayed when executing showremotepwrmgmt without specifying any options.	
	−G groupid	Specifies one or more group IDs of the remote power management group to be displayed. A figure from 1 to 32 can be specified.	
		e.gG 1	
		To specify multiple remote power management groups by range, specify the group IDs of the remote power management groups included in the range separating the beginning and end by hyphens (-).	
		e.gG 2-10	
		To specify multiple remote power management groups or ranges of remote power management groups, specify them separating by commas (,). Overlapping specification causes an error.	
		e.gG 1,3,5	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	
	−N nodeid	Specifies one node of the remote power management device registered to the remote power management group specified by the -G option and to be displayed. 1A figure from 1 to 128 can be specified.	
		e.gN 1	
EXTENDED DESCRIPTION	■ Execution spectrum "-G" option ca	cifying a remote power management group not constructed by the uses an error.	
	and no remote	tted for all remote power management groups by the -a option e power management group is constructed (initial status or after earremotepwrmgmt (8)), it causes an error.	
	display by the	ited specifying the remote power management device subject to $e - N$ option, and the $-G$ option specified at the same time is ange, it causes an error.

NAME	showremotestorage - Displays information on remote storage.					
SYNOPSIS	showremotestorage [-M] [<i>interface</i>]					
	showremotestorage -h					
DESCRIPTION	showremotestorage displays network interface configuration, as well as the status of connection to remote storage.					
	Any of the following is displayed as status.					
	Not Installed Remote storage cannot be used as the target SPARC M12/ M10 chassis has not been implemented.					
	Not Set	Remote storage cannot be used as no IP address has been assigned to the target network interface.				
	Unavailable	Remote storage cannot be used due to network disorder or some other internal error.				
	Session Exist Remote storage cannot be used over the target network interface as another network interface on the same SPARC M10 chassis is already connected to the remote storage. For example, if bb#00-lan#0 is already connected to the remote storage, an attempt to connect bb#00-lan#1 to the network storage will result in the "Session Exist" status being output.					
	Available	ailable IP address has been configured and remote storage can be used.				
	IP address	Connected to remote storage. Displays the IP address through which the connection has been made.				
Privileges	To execute this command, any of the following privileges is required.					
	platadm, platop,	fieldeng				
	For details on user j	privileges, see setprivileges(8).				
OPTIONS	The following optio	ns are supported.				
	-м С	isplays text one screen at a time.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.					

OPERANDS | The following operand is supported.

showremotestorage(8)

NAME	showresult - Displays the end status of the previously executed command.		
SYNOPSIS	showresult		
	showresult -h		
DESCRIPTION	showresult is a command to display the end status of the previously executed command.		
	showresult is a convenient way for the remote control program to confirm whether the previously executed command succeeded or not.		
Privileges	No privileges are required to execute this command.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-h Displays the usage. Specifying this option with another option or operand causes an error.		
EXTENDED DESCRIPTION	If showresult is executed after canceling the processing of the command in execution by [Ctrl]+[C] key, etc., the end status depending on the cancelled command is displayed by 0 or another figure.		
EXAMPLES	EXAMPLE 1 Display the execution result of showdate(8).		
	XSCF> showdate Sat Oct 20 14:53:00 JST 2012 XSCF> showresult O		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		

showresult(8)

NAME	showroute - Displays the routing information set in the XSCF network interface.		
SYNOPSIS	<pre>showroute [-M] [-n] {-a interface}</pre>		
	showroute -h		
DESCRIPTION	showroute is a command to display the routing information set currently in the XSCF network interface.		
	You can display the routing information of the specified network interface or all network interfaces. The following information is displayed.		
	Destination	Destination IP ad	dress
	Gateway	Gateway	
	Netmask	Netmask	
	Flags	Flag indicating th	e status of routing
		U H G R C !	Route enabled Only one host reachable Gateway used Dynamic route to be restored Entry of cache Rejected route
	Interface	XSCF network int	terface name
Privileges	No privileges are required to execute this command.		
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the routing information set in all the XSCF network interfaces.	
	-h	Displays the usag or operand cause	e. Specifying this option with another option s an error.
	-M	Displays text one	screen at a time.
	-n	Displays the IP ad name.	ddress without name-resolution of the host
I			

OPERANDS	The following operands are supported.					
	interface		Specifies the network interface to be displayed. You can specify any of the following depending on the system configuration. If it is specified with the –a option, it becomes invalid.

NAME	showservicetag - Displays whether the servicetag agents are currently enabled or disabled.			
SYNOPSIS	showservicetag [-v]			
	showservicetag -h			
DESCRIPTION	showservicetag is a command to display whether the servicetag agents are currently enabled or disabled.			
	Servicetags provide information platform, type, chassis serial number, etc, on platforms that support it.			
Privileges	To execute this command, platadm or platopprivilege is required.			
	Refer to setprivileges(8) for more information.			
OPTIONS	The following options are supported:			
	-h Displays usage statement. When used with other options or operands, an error occurs.			
	-v Specifies verbose output.			
EXAMPLES	EXAMPLE 1 Displaying the current state of the servicetag agents. (When it is enabled).			
	XSCF> showservicetag Enabled			
	EXAMPLE 2 Displaying the current state of the servicetag agents. (When it is disabled)			
	XSCF> showservicetag Disabled			
EXIT STATUS	The following exit values are returned:			
	0 Successful completion.			
	>0 An error occurred.

NAME	showsscp - Displays the IP address assigned to the SP to SP communication protocol (SSCP).		
SYNOPSIS	showsscp [-a -b bb_id] [-N network_id] [-M]		
	showsscp -h		
DESCRIPTION		command to display the setting values of the SSCP links of the S/M10-4S or crossbar boxes.	
		ses of the SSCP links in the system are displayed, they are output in ble is sorted by PPAR-ID.	
		ss of the specific PPAR or service processor is displayed, not a table address of the specified PPAR or service processor is displayed.	
	showsscp can	not be used on a SPARC M12-1/M12-2/M10-1/M10-4.	
Privileges	No privileges a	are required to execute this command.	
	For details on	user privileges, see setprivileges(8).	
OPTIONS	The following	options are supported.	
	-a	Displays the setting values of the SSCP links of all crossbar boxes and SPARC M12-2S/M10-4S	
	-ь bb_id	Specifies the target BB-ID. For SPARC M12-2S/M10-4S, you can specify an integer from 00 to 15. For crossbar box, you can specify an integer from 80 to 83.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	
	-N network_id	Specifies the ID of the SSCP link network subject to setting. For <i>network_id</i> , specify a figure from 0 to 2 and 0 to 4 in the case of SPARC M12-2S/M10-4S (without crossbar box) and SPARC M12-2S/M10-4S (with crossbar box), respectively. If omitted, all networks are specified.	
EXTENDED DESCRIPTION	SSCP links of is similar to	o is executed without specifying any options, the setting values of the of all crossbar boxes and SPARC M12-2S/M10-4S are displayed. This the case that the –a option is specified.	
		b is executed specifying BB-ID by $-b bb_id$, all the setting values of the specified BB-ID are displayed.	
	■ If showsscp is executed specifying the network ID by -N <i>network_id</i> , only the setting values of the SSCP links of the specified network ID are displayed.		

- You can display the setting values of the SSCP links on the specific network of the specific BB-ID by combining -b *bb_id* and -N *network_id*.
- You can display the setting values of all SSCP links on the specific network by combining -a and -N *network_id*.

For information before the settings are reflected, see applynetwork(8).

■ If -N *network_id* is specified and -b *bb_id* is not within the following range, it causes an error.

–N network_id	-b bb_id range
0	0 to 3
1	0 to 3
2	0 to 1

For SPARC M12-2S/M10-4S (without crossbar box)

	·
–N network_id	-b bb_id range
0	0 to 15, 80
1	0 to 15, 81
2	80 to 83
3	80 to 83
4	80 to 81

For SPARC M12-2S/M10-4S (with crossbar box)

- For SPARC M12-2S/M10-4S (without crossbar boxes), there are three networks of SSCP links as shown in the following.
 - Network between BB#00 and each SPARC M10-4S chassis (Network ID 0)
 - Network between BB#01 and each SPARC M10-4S chassis (Network ID 1)
 - Network between BB#00 and BB#01 (Network ID 2)
- For SPARC M12-2S/M10-4S (with crossbar boxes), there are five networks as shown in the following.
 - Network between XBBOX#80 and each SPARC M10-4S chassis (Network ID 0)
 - Network between XBBOX#81 and each SPARC M10-4S chassis (Network ID 1)
 - Network between XBBOX#80 and each crossbar box (Network ID 2)
 - Network between XBBOX#81 and each crossbar box (Network ID 3)
 - Network between XBBOX#80 and XBBOX#81 (Network ID 4)

EXAMPLES Note – The IP addresses shown in the following examples are samples.

showsscp(8)

NAME	showssh - Displa network.	tys the contents of the Secure Shell (SSH) service set in the XSCF	
SYNOPSIS	showssh [-chostkey][-M]		
	showssh -c pub	key [-u user_name][-M]	
	showssh -h		
DESCRIPTION	showssh is a command to display the contents of SSH service set currently in the XSCF network.		
	The following in	formation is displayed.	
	SSH status	Whether SSH service is enabled	
	RSA key	Host public key in the RSA format	
	DSA key	Host public key in the DSA format	
	Fingerprint	Host public key in the fingerprint format	
		user public key is specified, the user public key number and user natically given by the system are displayed.	
	In XSCF, only SS	H2 is supported.	
Privileges	To execute this c	ommand, any of the following privileges is required.	
	 Specification of useradm 	of the user name:	
	• Other than ab		
	No privileges	-	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	otions are supported.	
	-c hostkey	Displays the host public key. If you omit the -c option, -c hostkey is assumed specified.	
	-c pubkey	Displays the user public key. If you omit the $-c$ option, $-c$ hostkey is assumed specified.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-M	Displays text one screen at a time.	

showssh(8)

	-u <i>user_name</i> Specifies the user account name to display user public keys. It is specified with -c pubkey. If the -u option is omitted, the user public keys of the user account logged in currently are displayed.
EXTENDED DESCRIPTION	 The user public key numbers automatically given to user public keys can be specified when deleting user public keys by setssh(8).
	 You can set SSH service of the XSCF network by using setssh(8).
EXAMPLES	EXAMPLE 1 Display the information of the host public key.
	<pre>XSCP> showssh SSH status: enabled RSA key: ssh-rsa AAAAB3NzaClyc2EAAAABIwAAAIEAt0IG3wfpQnGr51znS9XtzwHcBBb/ UU0LN08SilUXE6j+ avlxdY7AFqBf1wGxLF+Tx5pTa6HuZ808yUBbDZVJAAAAFQCfKPxarV+/5qzK4A43Qaigkqu/ 6QAAIBM LQ12268pwibESrh5JmOhSxpLz13P26ks18qPr+7BxmjLR0k= Fingerprint: 1024 e4:35:6a:45:b4:f7:e8:ce:b0:b9:82:80:2e:73:33:c4 /etc/ssh/ ssh_host_rsa_key.pub DSA key: ssh-dss AAAAB3NzaClkc3MAACBAJSy4GxD7Tk4fxFvyW1D0NUDqZQPY3FuY2IG7QC4EQ1kewDnblB8 / JEqI+8pnfbWzmOWU37KHL190EYNAv6v+WZT6RE1U5Pyb8F16uq96L8QDMswF1ICMZgrn+i1JN Str6r8 KDJfwOQMmK0eeDFj2mL40N0vaLQ83+rRwW6Ny/yF1Rgv6FUpUqRLw4VeRb+u0fmPRpe6/ kb4z++10htp W13009kmWAAAICMNLR/ 9Jdd7yyG18+Ue7eBBJHrCA0pkSzvfzzFFj5XUzQBdabh5p5Rwz+1vriawFI Z19j2uhM/3HQdrvYSVBEdMjaasF9hB6T/ uFwP8yqtJf6Y9GdjBAhWuH8F13pX4BtvK9IeldqCscnOuu0 e2r1UoI6G1CMr64FL0YBSwfbwLIz6PSA/yKQe23dwfkSfcwQZNq/ 5pThGF13tob5QevZKCX20pDMCA OvVIMhqHuPNpX+hE19nPdBFG2Q== Fingerprint: 1024 9e:39:8e:cb:8a:99:ff:b4:45:12:04:2d:39:d3:28:15 /etc/ssh/ ssh_host_dsa_key.pub EXAMPLE2 Display the user public keys of the user account logged in currently. showssh(8)

NAME	showstatus - Displays the degraded Field Replaceable Unit (FRU).			
SYNOPSIS	showstatus [-M]			
	showstatus -h			
DESCRIPTION	showstatus is a FRUs composing	command to display the information of the degraded unit in the the system.		
Privileges	To execute this co	ommand, any of the following privileges is required.		
	useradm, plata	dm, platop, pparadm, pparmgr, pparop, fieldeng		
	For details on use	er privileges, see setprivileges(8).		
OPTIONS	The following op	tions are supported.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-M	Displays text one screen at a time.		
EXTENDED DESCRIPTION	 The information of the unit in which a failure or degradation occurred and unit one layer above in the FRUs composing the system is displayed. Any of the following statuses is displayed after "Status:" on the displayed unit. In addition, on the unit in which a failure or degradation occurred, "*" indicating the abnormal points is displayed. 			
	Status	Contents		
	Faulted	In the status in which the unit is not in operation due to a failure.		
	Degraded	A part of the unit has failed or degraded, but the unit is running.		
	Deconfigured	Due to the failure or degradation of another unit, the target unit and components of its underlying layer has been degraded, though there is no problem in them.		
	Maintenance	Maintenance work is in progress. addfru(8), replacefru(8), or initbb(8) is operating.		
	 In the system composed of multiple XSCFs, if the switches of the operator panels of the master XSCF and standby XSCFs do not match, "*" is displayed on the OPNL units of the master XSCF and standby XSCFs. 			
EXAMPLES		ay the degraded unit. Here, we take as an example the case that the CPU nemory on CMUL of BB#00 and PSU of XBBOX#80 are degraded due to		

```
a failure.
 XSCF> showstatus
     BB#00;
         CMUL Status:Normal;
             CPU#0 Status:Faulted;
             MEM#00A Status:Faulted;
     XBBOX#80;
        PSU#0 Status:Faulted;
EXAMPLE 2 Display the degraded part. Here, we take as an example the case that memory
           on MBU is degraded due to a failure.
 XSCF> showstatus
     MBU Status:Normal;
      MEM#0A Status:Faulted;
EXAMPLE 3 Display the degraded part. Here, we take as an example the case that memory
           on MBU is degraded due to a failure.
 XSCF> showstatus
     MBU Status:Normal;
      MEM#1B Status:Deconfigured;
EXAMPLE 4 Display the degraded part. Here, we take as an example the case that the CPU
           memory unit is degraded because the crossbar unit is degraded.
 XSCF> showstatus
     BB#00
      CMUU Status:Normal;
             CPU#1 Status:Deconfigured;
 *
        XBU#0 Status:Degraded;
EXAMPLE 5 Display the degraded components. The following is an example of a case
           where the XB cable has been degraded due to a failure.
 XSCF> showstatus
    BB#00 Status:Normal;
        XBU#1 Status:Normal;
         CBL#2L Status:Degraded;
EXAMPLE 6 Display the degraded components. The following is an example of a case
           where the XB cable under crossbar box has been degraded due to a failure.
 XSCF> showstatus
     XBBOX#80 Status:Normal;
      XBU#0 Status:Normal;
      CBL#L1 Status:Faulted;
        XBU#1 Status:Normal;
 *
         CBL#L2 Status:Degraded;
```

EXIT STATUS | The following exit values are returned.

0	Indicates normal end.

>0 Indicates error occurrence.

showstatus(8)

NAME	showtelnet - Displays the status of the Telnet service set in the XSCF network.		
SYNOPSIS	showtelnet		
	showtelnet -h		
DESCRIPTION	showtelnet is a in the XSCF netv	a command to display the status of the Telnet service set currently vork.	
	Either of the foll	owing statuses is displayed.	
	enable	Indicates that the Telnet service is in operation.	
	disable	Indicates that the Telnet service is not in operation.	
Privileges	No privileges are	e required to execute this command.	
	For details on us	er privileges, see setprivileges(8).	
OPTIONS	The following op	ptions are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXTENDED DESCRIPTION	You can set the T	Telnet service of the XSCF network by using settelnet(8).	
EXAMPLES	EXAMPLE 1 Display the status of the Telnet service set currently in the XSCF network.		
	XSCF> showtelnet Telnet status:enabled		
EXIT STATUS	The following exit values are returned.		
	0	Indicates normal end.	
	>0	Indicates error occurrence.

showtelnet(8)

NAME	showtimezone - Displays the currently set time zone of the XSCF and the daylight saving time information.		
SYNOPSIS	showtimezone -c tz		
	<pre>showtimezone -c dst [-m {standard custom}]</pre>		
	showtimezone -h		
DESCRIPTION	showtimezone is a comm and the daylight saving the	nand to display the currently set time zone of the XSCF me information.	
Privileges	To execute this command,	any of the following privileges is required.	
	useradm,platadm,plat pparmgr,pparop	op, auditadm, auditop, fieldeng, pparadm,	
	For details on user privile	ges, see setprivileges(8).	
OPTIONS	The following options are	supported.	
	-ctz	Displays the time zone.	
	-c dst	Displays the information of the daylight saving time.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-m{standard custom}	Specifies the information of the daylight saving time to be displayed. You can specify either of the following. If you omit the -m option, -m custom is assumed specified.	
		standard Displays the information of the daylight saving time set as standard in the current time zone.	
		<pre>custom Displays the information of the daylight saving time set by settimezone(8). If the daylight saving time is not set, nothing is displayed.</pre>	
EXTENDED DESCRIPTION	 The information of the daylight saving time is displayed in the following format If custom is specified <i>std offset dst[offset2] [from-date[/time] to-date[/time]] std</i> Abbreviated form of the time zone 		

offset	Offset time between the time zone and Greenwich Mean Time (GMT)	
	If the value of the off minus (-) or plus (+),	set is plus or minus, it is displayed as , respectively.
dst	Daylight saving time	name
offset2	Offset time between t	he daylight saving time and GMT
	If the value of the off minus (-) or plus (+),	set is plus or minus, it is displayed as , respectively.
from-date[/time]	Daylight saving time	start information
	from-date is displayed	in any of the following formats.
	a figure from 1 to w: Week to start th figure from 1 to 5 by 1 and 5, respec d: Day of the week displayed by a figu indicated by 0 and Jn Jn: Date to start th figure from 1 to 36 years, February 29 n n: Date to start the figure from 1 to 36 years, February 29	e daylight saving time. It is displayed by a with the first week and last week indicated tively. to start the daylight saving time. It is ure from 0 to 6 with Sunday and Saturday 6, respectively. e daylight saving time. It is displayed by a 55 with January 1st indicated by 1. In leap is not counted. 65 with January 2nd indicated by 1. In leap
	the time before switch	
		his is specified in the format of "hh:mm:ss." he default is 02:00:00.

to-date	[/time]	Daylight saving time end information
		<i>to-date</i> is displayed in any of the following formats.
		 Mm.w.d Mm: Month to end the daylight saving time. <i>m</i> is displayed by a figure from 1 to 12. <i>w</i>: Week to end the daylight saving time. It is displayed by a figure from 1 to 5 with the first week and last week indicated by 1 and 5, respectively. <i>d</i>: Day of the week to end the daylight saving time. It is displayed by a figure from 0 to 6 with Sunday and Saturday indicated by 0 and 6, respectively.
		J <i>n</i> J <i>n</i> : Date to end the daylight saving time. It is displayed by a figure from 1 to 365 with January 1st indicated by 1. In leap years, February 29 is not counted.
		<i>n</i> <i>n</i> : Date to end the daylight saving time. It is displayed by a figure from 1 to 365 with January 2nd indicated by 1. In leap years, February 29 is counted.
		<i>time</i> displays the time to switch from the daylight saving time by the time before switch.
		<i>hh:mm:ss</i> This is specified in the format of "hh:mm:ss." The default is 02:00:00.
∎ I	f stan	dard is specified

- You can set the time zone of XSCF by using settimezone(8).
- **EXAMPLES EXAMPLE 1** Display the time zone.

XSCF> **showtimezone -c tz** Asia/Tokyo

EXAMPLE 2 Display the daylight saving time information if you have set the time zone abbreviated form to JST, offset from GMT to +9, daylight saving time zone name to JDT, daylight saving time to one hour earlier, and period to 2:00 on the last Sunday of March to 2:00 on the last Sunday of October.

```
XSCF> showtimezone -c dst -m custom
JST-9JDT,M3.5.0,M10.5.0
```

EXAMPLE 3 Display the daylight saving time information if you have set the time zone abbreviated form to JST, offset from GMT to +9, daylight saving time zone name to JDT, daylight saving time to one hour earlier, and period to 0:00 on the first Sunday of April to 0:00 on the first Sunday of September.

```
XSCF> showtimezone -c dst
JST-9JDT-10,M4.1.0/00:00:00,M9.1.0/00:00:00
```

EXAMPLE 4 If the daylight saving time is not set by settimezone.

XSCF> showtimezone -c dst

EXAMPLE 5 Display the information of the daylight saving time set as standard in the current time zone.

```
XSCF> showtimezone -c dst -m standard
```

EXAMPLE 6 If the standard daylight saving time of the system is not set.

XSCF> showtimezone -c dst -m standard

EXIT STATUS The following exit values are returned.

- 0 Indicates normal end.
- >0 Indicates error occurrence.

SEE ALSO setdate (8), settimezone (8), showdate (8)

NAME	showuser - Displays the XSCF user account information.		
SYNOPSIS	showuser [-a] [-p] [-u] [-M]		
	showuser [-a]	[-p] [-u] [-M] <i>user</i>	
	showuser [-a]	[-p][-u][-M]-l	
	showuser -h		
DESCRIPTION	showuser is a	command to display the XSCF user account information.	
	If showuser is executed specifying the user account name, the account information of the specified user is displayed. If showuser is executed without specifying the user account name, the account information of the current user is displayed. If showuser is executed specifying the -1 option, the account information of all users is displayed.		
	information exp	executed specifying one or more options among -a, -p, and -u, the plained in the following sections on the options is displayed. If secuted without specifying any of these options, all the account displayed.	
Privileges	 ileges To execute this command, any of the following privileges is required. Display of your own account: No privileges are required. 		
		is are required. The account information of other users:	
	useradm	account mormanon of oner users.	
	For details on user privileges, see setprivileges(8).		
OPTIONS	The following options are supported.		
	-a	Displays the information regarding the validity of the password and status of the account. It is only valid for the XSCF user account.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	-1	Displays the account information of all XSCF users sorted by the login name of the user. It cannot be used with the <i>user</i> operand.	
	-M	Displays text one screen at a time.	
	-p	Displays all privileges assigned to users. This is valid for local users and remote users.	

	-u Displays the user ID (UID). This is valid for local users and remote users.		
OPERANDS	The following operands are supported.		
	<i>user</i> Name of the existing user account. It cannot be used with the -l option.		
EXAMPLES	EXAMPLE 1 Display the information regarding the validity of the password and account.		
	XSCF> showuser -a		
	User Name: jsmith		
	Status: Enabled		
	Minimum: 0		
	Maximum: 99999		
	Warning: 7		
	Inactive: -1 Last Change: Aug 22, 2005		
	Password Expires: Never		
	Password Inactive: Never		
	Account Expires: Never		
	EXAMPLE 2 Display the information of the user privileges.		
	XSCF> showuser -p		
	User Name: jsmith		
	Privileges: pparadm@1,3-6,8,9		
	platadm		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.

NAME	showvbootcerts - Displays the information of X.509 public key certificates setup at each physical partition (PPAR), that are used for performing Verified Boot of Oracle Solaris.		
SYNOPSIS	showvbootcerts -p <i>ppar_id</i> -a [-M]		
	showvbootcerts [-v] -p <i>ppar_id</i> -{s u} -i <i>index</i> [-M]		
	showvbootcerts -h		
DESCRIPTION	The showvbootcerts command dispalys the information of X.509 public key certificates setup at each physical partition (PPAR), that are used for performing Verified Boot of Oracle Solaris.		
	Verified Boot: th added by users	inds of X.509 public key certificates that are used at the time of ose which are pre-installed in the system and others which can be using the addvbootcert(8). The showvbootcerts command can rmation of both kinds of certificates.	
Privileges	To execute this c	command, either of the following privileges is required.	
	platadm, plato	op, fieldeng Enables execution for all PPARs.	
	pparadm, pparmgr, pparop Enables execution for PPARs for which you have access privilege.		
	For details on us	ser privileges, see setprivileges(8).	
OPTIONS	The following options are supported.		
	-a	Displays the information of all X.509 public key certificates that are registered in a PPAR.	
	-i index	Displays the information of the X.509 public key certificate with the management number specified in index. The possible management numbers are 1 or 2 when $-s$ is specified and 1 through 5 when $-u$ is specified.	
	-M	Displays text one screen at a time.	
	-p ppar_id	Specifies the PPAR-ID of the PPAR whose X.509 public key certificate is to be displayed.	
	-5	Displays the X.509 public key certificates that are pre-installed in the system.	
	-u	Displays the X.509 public key certificates that were added using the addvbootcert(8) command.	

	-V	Displays the content of the X.509 public key certificates in details.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
EXAMPLES	EXAMPLE 1	Display the information of the X.509 public key certificate with the manage- ment number 1, that was pre-installed in PPAR-ID 0.	
		nowvbootcerts -p 0 -s -i 1

l

NAME	snapshot - Collects and transfers the data regarding environment, logs, errors, and Field Replaceable Unit Identifier (FRUID).
SYNOPSIS	snapshot -d <i>device</i> $[-r]$ {-a -b <i>bb_id</i> } $[-e [-P password]]$ $[-L {F I R}] [-1] [-v] [[-q] -{y n}] [-S time [-E time]]$
	snapshot -t user@host:directory $\{-a \mid -b \ bb_id\}$ [-e [-P password]] [-k host-key] [-1] [-L $\{F \mid I \mid R\}$] [-p password] [-v] [[-q] - $\{y \mid n\}$] [-S time [-E time]]
	snapshot -h
DESCRIPTION	snapshot is a command to provide the data collection mechanism and acquire the diagnosis information on the service processor quickly, securely, and flexibly.
	snapshot collects the data of the configuration, environment, logs, error, and FRUID information and transfers it to the specified destination.
	snapshot outputs the collected data to a file. The file name is automatically generated based on the host name and IP address assigned to the service processor and the date and UTC time (hour-minute-second format) on the service processor when executing snapshot. For example, it can be jupiter:10.1.1.1_2012-10-20T22-33-44. snapshot cannot specify the output file name. If the file and command outputs are collected from the service processor, snapshot compresses the output data and write it on the archive of the .zip format.
	The output file is a .zip format archive composed of the .zip format archives into which the information collected in each SPARC M12/M10 systems chassis is compressed.
	The name of .zip archive of each SPARC M12/M10 systems chassis is automatically generated based on the SPARC M12/M10 systems name, host name and IP address assigned to the service processor and the date and UTC time (hour- minute-second format) on the service processor when executing snapshot. For example, it can be BB#01_jupiter_10.1.1.1_2012-10-20T22-33-44.
	The name of the .zip archive of the SPARC M12/M10 systems chassis which does not have the host name or IP address assigned to the service processor is automatically generated based on the SPARC M12/M10 systems name and the date and UTC time (hour-minute-second format) on the service processor when executing snapshot. For example, it can be BB#03_2012-10-20T22-33-44.
	If snapshot is executed on slave XSCF, only the .zip archive file of the SPARC M12/M10 systems chassis which executed the command is transferred to the specified destination.
	snapshot saves the collected data in the remote network host or external media device based on which of the -t and -d options is used. To save the data collected by using the -t option in the remote network host, it is necessary to specify the host name (or IP address), destination directory on the remote network host, and

user name on the remote host. When saving data on the remote network host, snapshot opens SSH network connection to function as a channel of data to the remote file.

You can limit data collection on larger log files by specifying the date range with the -S option, and -E option if necessary.

SSH, which is an encrypted network protocol, is used to transmit data over the network. Moreover, .zip archives can also be encrypted using SSL. To encrypt the .zip archive itself, use the -e option. To decode the .zip archive encrypted in this process, use the encrypted password specified in snapshot by openss1. The following shows an example of decoding of the file jupiter_10.1.1.1_2012-10-20T22-33-44.zip.e.

% openssl aes-128-cbc -d -in jupiter_10.1.1.1_2012-10-20T22-33-44.zip.e -out jupiter_10.1.1.1_2012-10-20T22-33-44.zip

All .zip archives generated by snapshot contain two files generated by snapshot itself. The firs file named README describes the original name of the .zip archive, name of the setting file on the service processor used to create the .zip archive, version of snapshot, and whether the log-dedicated mode (-1 option) is used to create the archive. The second file named CONFIG is a copy of the actual setting file used by snapshot to create the archive.

The data generated for each SPARC M12/M10 systems chassis by snapshot may be used by field engineers to diagnose the problems with the system. snapshot can collect different sets of data according to the purpose of the diagnosis. These data sets are called Initial, Root Cause, and Full, respectively, and set by using the -L option.

To diagnose a problem from relevant data, execute the snapshot as soon as possible, without powering On/Off the PPAR or changing the setup, after the problem has occurred. Useful data for the diagnosis may be lost if time has passed, other commands are executed or the state of the system is changed in any way.

Privileges To execute this command, platadm or fieldeng privilege is required.

For details on user privileges, see setprivileges(8).

OPTIONS | The following options are supported.

-a		common logs in the system, the logs stored /M10 systems chassis are collected and
	If the system has a collected.	in abnormality, some logs cannot be
-ь <i>bb_id</i>	Selects the BB-ID t IDs.	o collect data. You cannot specify multiple
		common logs in the system, the logs stored ARC M12/M10 systems chassis are
		specify an integer from 0 to 15 and 80 to 83 ARC M12/M10 systems chassis and crossbar stively.
-d device	Specifies the extern following options	nal media device to be used. For -d, the are available.
	-r	Deletes all files in the external media device before collecting data. This option is disabled if it is used with the -t option.
−E time	frame of the log m time option of the	to finish collecting data. Defines the time essages collected by snapshot with the -S start time. Only the log entries created ecified by -E <i>time</i> are collected by o the -S option.
	time	Use either of the following two formats described by strptime(3).
		%Y-%m-%d,%H:%M:%S %Y-%m-%d_%H-%M-%S
-е	Encrypts the archinand <i>password</i> .	ve of the zip format. It is required to use $-P$
-h	Displays the usage or operand causes	e. Specifying this option with another option an error.

-k host-key	Specifies the -t option. Set the public key to be used by the service processor to log in the network host. This option is disabled if it is used with the -d option.		
	You can specify this using up to 895 characters.		
	The values which can be specified in <i>host-key</i> are below.		
	none	If the public key is not used for authentication of the network host, specify this literal value.	
	download	For snapshot to download the public host key of the network host using SSH and the public host key from the host specified by the -t argument, specify this literal value. snapshot displays the SHA- 256 fingerprint of the key and requests for confirmation. If the key is accepted, it is used for server authentication. If the key is rejected, snapshot is terminated without executing anything. If the -k option is not specified, this is the default operation in the SSH target mode. The specified public key is used for server authentication. The <i>host-key</i> argument must be the complete public key of the network host (beginning with the key type). (Therefore, it must be the complete contents of /etc/ssh/ ssh_host_rsa_key.pub on the network host.)	
		e key needs to be enclosed in quotation ed by the shell as a single word.	
-L {F I R}	Specifies the log se	et to be collected.	
	F I R	Full log set Initial log set Root Cause log set	
	If the log set is not default.	t specified, the Full log set is collected by	
-1	Makes a specificat Command outputs	ion so that only log files are collected. s are not collected.	
-n	Automatically resp	oonds to prompt with "n" (no).	

	-P password	Specifies it with th be used to encrypt	ne -e option. Set the encrypted password to t the output file.
		You can specify th	is using up to 63 characters.
	-p password	-	vord to be used for SSH login. This option is -t option. If it is used with the -d option, it
		You can specify th	is using up to 63 characters.
	-d	Prevents display o output.	of messages, including prompt, for standard
	-s time	frame of the log m <i>time</i> option of the e	to start collecting data. Defines the time ressages collected by snapshot with the -E end time. If the end time is not specified, the when snapshot is executed. See also the
		time	Use either of the following two formats described by strptime(3).
			%Y-%m-%d,%H:%M:%S %Y-%m-%d_%H-%M-%S
	-t user@host:directory	destination. Specif network host in th login to the archiv directory on the ar	tost and remote directory of the data transfer by the host name or IP address of the ne <i>host</i> field. Specify the user name for ssh re host in the <i>user</i> field. Specify the archive rchive host in which the output file is saved id. The <i>directory</i> field must not begin with "-
			directory is created by snapshot. Create the the remote host in advance.
	-v	snapshot files for e	information. The status of correction of each SPARC M12/M10 systems chassis. If it ne $-q$ option, the $-v$ option becomes invalid.
		executed by the sr given. In this case,	privilege to operate all commands to be napshot setting file may not have been , an error message indicating that these ons are not allowed is displayed.
	-у	Automatically resp	ponds to prompt with "y" (yes).
EXTENDED DESCRIPTION	Operation mode The overview of the	e operation mode of	f snapshot is described below.
		ī	-

snapshot(8)

	The initial mode is the "SSH target mode." If the data collector is started specifying the -t option, this mode is applied for execution. In this mode, the data collector opens the SSH connection of the destination specified by the service processor (after appropriate authentication) and sends the data archive of the zip format to the destination host via the SSH connection. No target directory is created by snapshot. Create the target directory in the remote host in advance. Transfer encryption in this mode is performed by SSH. The second mode is the "USB device mode." If the data collector is started specifying the -d option, this mode is applied for execution. In this mode, the outputs of the data collector (archive of the zip format) are saved in files on the USB device. The USB device needs to have been formatted by the FAT32 file system. In this mode, you can use the -e option to encrypt zip files like the SSH target mode. However, in this mode, data is local to the service processor, so transfer encryption (like SSH) is not performed.
	To execute snapshot in the master chassis, connect the USB device to a USB port of the master chassis.
EXAMPLES	EXAMPLE 1 Download data to the external media device.
	<pre>XSCF> snapshot -d usb0 -r -b 3 Testing writability of USB deviceSUCCESS About to remove all files from device `usb0'. Continue? [y n] : y Collecting data into /media/usb_msd/jupiter_10.1.1.1_2012-10-20T22-41- 51.zip Data collection complete.</pre>
	EXAMPLE 2 Limit log collection to obtain specific logs for the data range.
	<pre>XSCF> snapshot -d usb0 -b 3 -S 2012-01-01,01:00:00 -E 2012-01- 31_14-00-00 Testing writability of USB deviceSUCCESS Collecting data into /media/usb_msd/jupiter_10.1.1.1_2012-10-20T22-41- 51.zip Data collection complete.</pre>
	EXAMPLE 3 Collect the logs of all SPARC M12/M10 systems chassis.

NAME	switchscf - Switches the status of XSCF in between master and standby.			
SYNOPSIS	switchscf [$[-q] - {y n}$] -t {Master Standby} $[-f]$			
	switchscf -h			
DESCRIPTION	switchscf is a command to switch the status of XSCF in between active and standby.			
	switchscf can	be used only for the systems composed of multiple XSCFs.		
		e status means master XSCF. Therefore, the master XSCF and XSCF atus is switched by executing switchscf.		
	switchscf can be executed in the master or standby XSCF. If the command is executed for the XSCF logged in currently, switch processing is executed between paired XSCFs (between XBBOX#80 and XBBOX#81 or between BB#00 and BB#01, if there is some or no crossbar box, respectively).			
	Note – When switching XSCFs, the sessions of the network connected to the master XSCF are disconnected.			
	Caution – Normally, XSCFs cannot be switched during maintenance work. If XSCF cannot be switched because the execution result of switchscf becomes "Switching of XSCF state is disabled due to a maintenance operation. Try again later.", confirm whether the maintenance commands of addfru(8), replacefru(8), and flashupdate(8) are in execution. If any of these commands is in execution, wait until the command is terminated. If XSCF cannot be switched though the maintenance command is not in execution, use the -f option to switch.			
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.		
0		er privileges, see setprivileges(8).		
OPTIONS	The following options are supported.			
	-f	If XSCF is not switched, it can be switched forcibly.		
		Caution – The –f option forcibly switches XSCF. Therefore, use it only if switching by normal operations is impossible.		
	-h	Displays the usage. Specifying this option with another option or operand causes an error.		
	-n	Automatically responds to prompt with "n" (no).		

switchscf(8)

	-đ	Prevents display of messages, including prompt, for standard output.
	-t Master	Switches the status of XSCF to the master status.
	-t Standby	Switches the status of XSCF to the standby status.
	-У	Automatically responds to prompt with "y" (yes).
EXTENDED DESCRIPTION		te the command, a prompt to confirm whether to execute it with tents is displayed. To execute, press the [y] key. To cancel, press the
EXAMPLES	EXAMPLE 1 Switc	h the status of the XSCF logged in currently to the standby status.
		scf -t Standby switch between the Master and Standby states. Continue?
	EXAMPLE 2 Switc prom	th the status of the XSCF logged in currently to the standby status. The upt is automatically given a " y " response.
		scf -t Standby -y switch between the Master and Standby states. Continue?
EXIT STATUS	The following ex	it values are returned.
	0	Indicates normal end.
	>0	Indicates error occurrence.

I

NAME	testsb - Performs an initial diagnosis on the specified physical system board (PSB).		
SYNOPSIS	testsb [[-q]-{y n}] [-m diag=mode] location		
	testsb [[-q] -{y n}]] [-m diag=mode	?] -a
	testsb -v [-y -n]	[-m diag=mode]	[-p] [-s] location
	testsb -v [-y -n]	[-m diag=mode]	[-p] [-s]-a
	testsb -h		
DESCRIPTION	testsb is a comman	d to perform the in	itial diagnosis of the specified PSB.
	diagnosed. While dia	gnosing, the PSB is losis. In addition, th	of each device mounted in PSB are powered on and off. The diagnosis result is ne items of Test and Fault displayed by

NAME	traceroute - Displays the network route to the specified host.		
SYNOPSIS	<pre>traceroute [-n] [-r] [-v] [-m maxttl] [-p port] [-q nqueries] [-s src_addr] [-w wait] host</pre>		
	traceroute -h		
DESCRIPTION	The network	is a command to display the network route to the specified host. route means the router (gateway) to connect the specified hosts and	
	network devices and displays what kinds of routers are located on the route. traceroute attempts to extract the ICMP TIME_EXCEEDED response using the TTL field of IP protocols from all gateways on the network route to the specified hosts or network devices.		
Privileges		are required to execute this command. n user privileges, see setprivileges(8).	
OPTIONS	The following	g options are supported.	
	-h	Displays the usage. Specifying this option with another option or operand causes an error.	
	–m <i>maxttl</i>	Specifies the maximum number of hops. Displays the same number of gateways as the specified number of hops. If omitted, it is set to 30.	
	-n	Outputs just with the IP address without reverse DNS lookup.	
	-p port	Specifies the port number of the UDP packet to be used. This is valid only if the UDP packet is used. If omitted, it is set to 33434.	
	-q nqueries	Specifies the number of attempts for one gateway. If omitted, it is set to 3 times.	
	-r	Directly transfers packets to the specified hosts or network devices ignoring the routing table. If there is no target host or network device on the same physical network, it causes an error.	
	-s src_addr	Specifies the source address following the route.	
	-v	Displays detailed information. Displays the transmission size of the packet and source address.	
	-w wait	Specifies the timeout time by seconds. If omitted, it is set to 3 seconds.	
OPERANDS	The following	g operands are supported.	
	host	Specifies the hosts or network devices to send packets to. You can specify a host name or IP address. Specifying a DSCP address causes an error.	

traceroute(8)

EXTENDED	 If no option is specified, the usage is displayed. 				
DESCRIPTION	■ If "localhost" and the loopback address (127.0.0.0/8) are specified in <i>host</i> , only				
	the users with fieldeng privilege can execute this command.				
	• If the interface of the SSCP link is specified in <i>host</i> , only the users with				
	fieldeng privilege can execute this command.				
EXAMPLES	EXAMPLE 1 Display the network route to the host server.example.com.				
	XSCF> traceroute server.example.com				
	traceroute to server.example.com (192.168.100.10), 30 hops max, 38 byte packets

	0 Indicates normal end.				
	>0 Indicates error occurrence.				

NAME	unlockmaintenance - Release multi-activated lock created by addfru(8) and replacefru(8).				
SYNOPSIS	unlockmaintenance [[-q] - {y n}]				
	unlockmaintenance -h				
DESCRIPTION	unlockmaintenance is a command to release the multi-activated lock from maintenance commands when maintenance procedure is unexpectedly halted due to the termination of LAN etc., in the middle of system maintenance using addfru(8) and replacefru(8).				
Privileges	To execute this command, fieldeng privilege is required.				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-n Automatically responds to prompt with "n" (no).				
	-q Prevents display of messages, including prompt, for standard output.				
	-y Automatically responds to prompt with "y" (yes).				
EXTENDED DESCRIPTION	Note – Please never use it in any case other than when maintenance procedure is unexpectedly halted in the middle of system maintenance due to termination of LAN etc., as it forcibly halts the multiple activation prevention lock of the maintenance menu.				
	• When you execute the command, a prompt to confirm whether to execute it with the specified contents is displayed. To execute, press the [y] key. To cancel, press the [n] key.				
	• You can execute unlockmaintenance only from the master XSCF.				
EXAMPLES	EXAMPLE 1 Unlock XSCF that was locked by maintenance work.				
	<pre>XSCF> unlockmaintenance This command unlocks the maintenance lock which prevents the multiple execution of maintenance commands. *Never* use this command, except when the lock state remains by some reason. Careless execution of this command causes serious situation because it interrupts the running command and XSCF might not be able to recognize the parts. Continue? [y n] :y</pre>				
	EXAMPLE 2 Unlock XSCF that was locked by maintenance work. The prompt is automat-				

	ically given a "y" response.		
	<pre>XSCF> unlockmaintenance -y This command unlocks the maintenance lock which prevents the multiple execution of maintenance commands. *Never* use this command, except when the lock state remains by some reason. Careless execution of this command causes serious situation because it interrupts the running command and XSCF might not be able to recognize the parts. Continue? [y n] :y</pre>		
	EXAMPLE 3 Unlock XSCF that was locked by maintenance work. The message is hidden and the prompt is automatically given a "y" response.		
	XSCF> unlockmaintenance -q -y XSCF>		
EXIT STATUS	The following exit values are returned.		
	0 Indicates normal end.		
	>0 Indicates error occurrence.		
SEE ALSO	addfru(8), replacefru(8)		

NAME	version - Displays the version number of the firmware.				
SYNOPSIS	version -c xcp [-v] [-t]				
	version -c {cmu xscf} [-v] [-M]				
	version -h				
DESCRIPTION	version is a con	nmand to display the version of the firmware.			
	The following ve	ersions can be displayed.			
	xcp	Versions of XSCF Control Package (XCP) applied to the system			
	Cmu	Representative version of CMU firmware. CMU firmware is the archives of the Power-on self test (POST)/OpenBoot PROM/ Hypervisor			
	xscf	Version of XSCF firmware			
Privileges	To execute this co	ommand, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	-c xcp Displays the versions of XCP.				
	-c cmuDisplays the representative version of the archives of the POST/ OpenBoot PROM/Hypervisor (cmu firmware version)c xscfDisplays the version of the XSCF firmware.				
	-h Displays the usage. Specifying this option with another option or operand causes an error.				
	-M	Displays text one screen at a time.			
	-tDisplays the information of the total number of versions of XCP registered to XSCF. It is specified with -c xcpvDisplays detailed information. If it is specified with -c xscf, the same information as in the normal status is displayed.				
EXAMPLES	EXAMPLE 1 Displ	ay the versions of XCP on the SPARC M10-4S (without crossbar boxes).

NAME	viewaudit - Displays the audit records.				
SYNOPSIS	viewaudit				
	viewaudit [-A date-time] [-B date-time] [-C] [-c classes] [-D date-time] [-E end- record] [-e events] [-i audit-ids] [-1] [-m del] [-n] [-p privilege-results] [-r return- values] [-S start-record] [-u users] [-x]				
	viewaudit -h				
DESCRIPTION	viewaudit is a command to display the audit records.				
	If viewaudit is executed without specifying any options, all of the current local audit records are displayed. If viewaudit is executed specifying the option, only the selected records are displayed. By default, the records are displayed in the text format. One token per line is shown and comma is used as the field separator character. The output format can be changed by separately using the options of $-C$, $-E$, -1 , $-m$ <i>del</i> , $-n$, $-S$, and $-x$.				
Privileges	To execute this command, auditadm or auditop privilege is required.				
	For details on user privileges, see setprivileges(8).				
OPTIONS	The following options are supported.				
	–A date-time	Selects the records which occurred after <i>date-time</i> . <i>date-time</i> is based on the local time. You can specify a range by using the $-A$ and $-B$ options together. The valid values of <i>date-time</i> are below.			
	 Absolute time <i>date-time</i>: <i>yyyymmdd</i>[<i>hh</i>[<i>mm</i>[<i>ss</i>]]] The variables have the following meanings. 				
		 yyyy = Year (1970 is the earliest valid value.) mm = Month (01 to 12) dd = Day (01 to 31) hh = Hour (00 to 23) mm = Minute (00 to 59) ss = Second (00 to 59) 			
	The default values of <i>hh, mm,</i> and <i>ss</i> are 00.				

–B date-time	Selects the records which occurred before <i>date-time</i> . <i>date-time</i> is based on the local time. You can specify a range by using the –A and –B options together. The valid values of <i>date-time</i> are the absolute time and offset time.			
	 Absolute time <i>date-time</i>: <i>yyyymmdd</i>[<i>hh</i>[<i>mm</i>[<i>ss</i>]]] The variables have the following meanings. 			
	 yyyy = Year (1970 is the earliest valid value.) mm = Month (01 to 12) dd = Day (01 to 31) hh = Hour (00 to 23) mm = Minute (00 to 59) ss = Second (00 to 59) 			
	• Offset <i>date-time</i> : $+n d h m s$			
	 The variables have the following meanings. n = Number of units d = Number of days h = Number of hours m = Number of minutes s = Number of seconds 			
	The offset time can be specified only by the -B option and needs to be specified with the -A option.			
	The default values of <i>hh</i> , <i>mm</i> , and <i>ss</i> are 00.			
-C	Adds the number of records matching the selection standard at the end of output.			

−c classes	Selects the record of the specified class. <i>classes</i> is a comma- separated list of audit classes. Classes can be specified with a number or name. The prefix "ACS_" can be omitted. For example, the classes of audit-related events can be expressed as ACS_AUDIT, AUDIT or 2.			
	The valid classes are below.			
	all	All classes		
	ACS_SYSTEM(1)	System-related event		
	ACS_write(2)	Command that can change the status		
	ACS_READ(4)	Command to display the current status		
	ACS_LOGIN(8)	Login-related event		
	ACS_AUDIT(16)	Audit-related event		
	ACS_PPAR(32)	PPAR administration-related event		
	ACS_USER(64)	User administration-related event		
	ACS_PLATFORM(128)	Platform administration-related event		
	ACS_MODES(256)	Mode-related event		
−D date-time	Selects the records which occurred on a specific day (in 24 hours between 00:00:00 and 23:59:59 of the specified day). Specify the specified date in the format of <i>yyyymmddhhmmss</i> (year, month, day, hour, minute, second) based on the local time. All records with the time stamp of the specified day are selected. It becomes invalid even if the hour, minute, or second is specified. The $-D$ option cannot be specified with the $-A$ or $-B$ option.			
–E end-record	Specifies the last record matching the selection standard for display.			
-e events	Selects the record of the specified event. <i>events</i> is a comma- separated list of audit events. Events can be specified with a number or name. The prefix "AEV_" can be omitted. For example, the events of SSH login can be expressed as AEV_LOGIN_SSH, LOGIN_SSH, or 4.			
	For the list of valid event	s,see showaudit -e all.		
	Displays the usage. Speci			

	-i audit-ids	Selects the record of the specified audit session identifier. If you are interested in the activities reflected in a specific audit record, you can display all audit records of the session. <i>audit-id</i> is not fixed and assigned again when the service processor is reset. <i>audit-ids</i> is a comma-separated list of audit session identifiers. <i>audit-id</i> is the number after the label "subject" of the audit file.
		For example, <i>audit-id</i> is "1" in the following list.
		<pre>subject,1,bob,normal,telnet 45880 jupiter</pre>
	-1	Outputs one record per line.
	-m del	Not the default delimiter (comma) but <i>del</i> is used as the field separator character. If <i>del</i> has a special meaning in the shell, it is necessary to enclose it in quotation marks. The maximum number of the delimiters is three. Delimiters have no meaning. In addition, they cannot be specified with the $-x$ option.
	-n	Specifies the UID and IP address not to convert them to the user name or host name.
	-p privilege-results	Selects the record according to the specified <i>privilege-results</i> . <i>privilege-results</i> is a comma-separated list. <i>privilege-results</i> is granted, denied, or error.
	-r return-values	Selects the record according to the specified return value. <i>returnvals</i> is a comma-separated list of the value success or failure. success corresponds to the return value 0. failure corresponds to nonzero return values.
	-S start-record	Specifies the first record matching the selection standard for displayed.
	-u <i>users</i>	Selects the records belonging to the specified user. <i>users</i> is a comma-separated list of users. The user can specify a user name or figure UID.
	-x	Outputs in the XML format.
EXAMPLES	EXAMPLE 1 Display	the audit records of December 12, 2005.
	XSCF> viewaudit	-D 20121212
	file,1,2012-01-1	11 10:52:30.391 -05:00,20120111155230.0000000000.jupiter

NAME	xscfstartupmode - Set up the startup mode of SPARC M12-1/M10-1.			
SYNOPSIS	xscfstartupmode -m mode			
	xscfstartupmode -d			
DESCRIPTION	<code>xscfstartupmode</code> is the command to set up the startup mode of SPARC M12-1/M10-1.			
	There are two kinds of startup mode: fast and normal.			
	In order to automatically start up the physical partitions of a SPARC M12-1/M10-1, use this command to set the startup mode to "fast", set the operation panel mode switch to "Locked" and turn on the input power of the system (AC ON). If the startup mode is set to "normal", the physical partitions start up only after the execution of the poweron(8) on the XSCF. If the startup mode is set to "fast" while the operation panel mode switch is set to "Service", XSCF is started in the "normal" mode when the input power of the system is turned on.			
	This command is not supported on SPARC M12-2/M12-2S/M10-4/M10-4S systems.			
Privileges	To execute this command, platadm or fieldeng privilege is required.			
	For details on user privileges, see setprivileges(8).			

OPTIONS	The following options are supported.			
	-d	Display the following information.		
		Current Mode	Display the startup mode of the running system.	
			fast: The system has been started in "fast" mode.	
			normal: The system has been started in "normal" mode.	
		Setting Mode	Display the status of startup mode.	
			fast: "fast" mode has been configured. Setting the operation panel mode switch to "Locked" and turning off and on the input power of the system will cause the system to start in the "fast" mode.	
			normal: "normal" mode has been configured. Turning off and on the input power will cause the system to start in the "normal" mode.	
			fast [need AC OFF/ON]: "fast" mode has been configured. Setting the operation panel mode switch to "Locked" and turning off and on the input power of the system will cause the system to start in the "fast" mode.	
			normal [need AC ON/OFF]: "normal" mode has been configured. Turning off and on the input power will cause the system to start in the "normal" mode.	

	-m <i>mode</i>		p mode. The following parameters, fast and pecified. The default mode is normal.		
		fast	Set the startup mode to "fast". Turning off/on the input power of system (AC OFF/ON) is required after setting the startup mode to "fast". If the input power of system is turned off/on while the operation panel mode switch is in "Locked" state, the system starts in "fast" mode. If the input power of system is turned off/on while the operation panel mode switch is in "Service" state, the system starts in "normal" mode.		
		normal	Set the startup mode to "normal". Turning off/on the input power of system (AC OFF/ON) is required after setting the startup mode to "normal". After the input power of system is turned off/on, the system starts up in "normal" mode, irrespective of the status of operation panel mode switch.		
EXTENDED DESCRIPTION	 If the startup mode is changed to "fast" while the physical partitions are in suspension, the physical partitions do not start automatically when XSCF is started. Either turn off/on the input power of system or execute the poweron(8) on the XSCF to start the physical partitions. 				
	 If the state of the operation panel mode switch is changed while XSCF is running, the startup mode does not change. 				
	 If the physical partitions are started in the "fast" mode, power recover is registered in the Cause section of the power log. 				
	 The configuration information of startup mode is not included in the system configuration information, that is saved by dumpconfig(8) and restored by restoreconfig(8). 				
	 When started in the "fast" mode, the highest number of possible logins through telnet or SSH will be 10. 				
	■ For SPARC M10-1, the audit log of this command will not be collected.				
	 When creating or changing system configuration information or logical domain configuration information, check that XSCF has been started in "normal" mode. 				
	 Execute the following commands only when XSCF has been started in "normal" mode: 				
	showhardconf(8)				
	■ showsta	tus(8)			
	∎ dumpcon	fig(8), restorec	onfig(8)		

	replacefru(8)restoredefaults(8)
	 flashupdate(8)
EXAMPLES	EXAMPLE 1 Set the startup mode to "fast".
	XSCF> xscfstartupmode -m fast
	EXAMPLE 2 Display the startup mode (before turning on the input power, after "fast" mode has been set up).
	XSCF> xscfstartupmode -d Setting Mode: fast [need AC OFF/ON] Current Mode: normal
	EXAMPLE 3 Display the startup mode (when started in "fast" mode).
	XSCF> xscfstartupmode -d Setting Mode: fast Current Mode: fast
	EXAMPLE 4 Display the startup mode (when started in "normal" mode).
	XSCF> xscfstartupmode -d Setting Mode: normal Current Mode: normal
EXIT STATUS	The following exit values are returned.
	0 Indicates normal end.
	>0 Indicates error occurrence.
