# **SIMPLIA MF-STEP COUNTER V60L14**

A decorative horizontal band with a red-to-dark-red gradient, featuring abstract, glowing white and red lines that swirl and intersect, creating a sense of motion and depth.

## **User's Guide**

Windows

SIMPLIA-STP-EN60(07)  
November 2018

# Preface

SIMPLIA MF-STEPCOUNTER is an application that measures individual program step information, analyzes interrelationships among various development resources, and creates documents based on C, COBOL, Java, IDL, HTML, JSP, CSS, JavaScript, ASP, C#, Visual Basic, VBScript, and JScript source files, include files, COBOL libraries, and text files.

## New Features

Enhancements from V60L13 are shown below.

- Added "Continue measurement without displaying message" as common option.

## To Read the Help

The latest version of Internet Explorer supported by each operating system is recommended as the web browser for referring to the user's guide.

## Registered Trademark Information

The registered trademarks and trademarks used in this user's guide are as follow.

- Microsoft, Windows, MS-DOS, MS, Visual C#, and Visual Basic are registered trademarks of Microsoft Corporation in the United States and other countries.
- INFORMIX is a registered trademark of Informix Software, Inc. in the United States.
- Oracle and Java are registered trademarks of Oracle and/or its affiliates in the United States and other countries. Company names and product names used in this document are registered trademarks or trademarks of those companies.

## Abbreviations

The following abbreviations are used in this user's guide.

"Windows(R) 10 Home", "Windows(R) 10 Pro", "Windows(R) 10 Enterprise", or "Windows(R) 10 Education"	- >	"Windows 10"
"Windows(R) 8.1", "Windows(R) 8.1 Pro", or "Windows(R) 8.1 Enterprise"	- >	"Windows 8.1"

# Chapter 1 Background and Purpose

In the maintenance and management phases during application development, if development quantity and work quantity are treated as values, a program development step may be used as a criterion.

During manual measurement, problems such as the following may be encountered.

- The number of measurements becomes enormous if information of include files, libraries, and other things are included.
- The measurement quantity increases in proportion to development resources.
- The measurement methods and measurement criteria are inconsistent among projects.

MF-STEP COUNTER automates the measurement of program source steps, include files, COPY phrase library files, and other files performed manually in a traditional manner in order to reduce the time required for measurement operations and to improve reliability of the measurement results. It can also maintain asset list information of the measurement target to establish measurement criteria and provide consistency.

## Chapter 2 Overview

MF-STEPCOUNTER has the following features.

- Step Measurement

This function is able to obtain the measurement results based on measurement criteria. The measurement results can be displayed on screen and output to files by programming language, and also used as useful information for maintenance tasks.

- Variation Measurement

This function is able to measure variation steps by comparing new and old sources. Variation steps can be measured by valid lines and by comment lines, according to the language category, and therefore, it is useful for grasping valid variations even though it is hard to do through simple file comparison.

- Java Software Metrics Measurement

This function measures items from Java sources and class files as indications of class and method quality management and evaluation. Measurement is available by class unit and by method unit, and the measurement results are output for each specified measurement unit.

**For details on Java Software Metrics Measurement, refer to the user's guide for the "Java Software Metrics Measurement function."**

## Chapter 3 Installation Procedure

This chapter explains the installation procedure for MF-STEP COUNTER.

### 3.1 Installation and Uninstallation

---

For details on the installation and uninstallation of MF-STEP COUNTER, refer to the Software Release Guide provided with the product.

First-time MF-STEP COUNTER users should refer to [Sample Usage](#). The section explains a rough outline of operation.

# Chapter 4 Function Description

This chapter explains the various functions of MF-STEP COUNTER.

## 4.1 Step Measurement Criteria

This section explains the criteria for step measurement.

### 4.1.1 Auto-detection Measurement Criteria

The target file is measured according to the measurement criteria of each language category. The language category is judged by the extension of the measured file.

For file extensions that are measured and the corresponding measurement criteria, refer to the following table.

The extension column shows the extensions set during installation. Use the [Common - Extension] option to make changes.

Extension	Type	Measurement Criteria
(* .CBL), (* .COB), (* .COBOL), (* .SCOB), (* .PCO)	COBOL	<a href="#">4.1.2 COBOL Measurement Criteria</a>
(* .C), (* .CPP), (* .H), (* .RC)	C/C++	<a href="#">4.1.3 C/C++ Measurement Criteria</a>
(* .JAVA)	Java Class Java Interface	<a href="#">4.1.4 Java Measurement Criteria</a>
(* .SQLJ)	SQLJ	
(* .IDL)	IDL	<a href="#">4.1.6 IDL Measurement Criteria</a>
(* .HTML), (* .HTM)	HTML	<a href="#">4.1.7 HTML/JSP/JS/CSS Measurement Criteria</a>
(* .JSP), (* .JSPF), (* .TAG), (* .TAGX), (* .TAGF)	JSP	
(* .JS)	JavaScript	
(* .CSS)	StyleSheet	
(* .ASP), (* .ASAX), (* .ASCX), (* .ASPX)	ASP.NET	<a href="#">4.1.8 .NET (ASP/C#/VB)/HTML/JS/CSS Measurement Criteria</a>
(* .CS)	C#	
(* .VB), (* .VBS)	VB.NET	
(* .FRM), (* .BAS), (* .CLS), (* .CTL), (* .PAG), (* .DSR)	VB 6.0	<a href="#">4.1.9 Visual Basic 6.0 Measurement Criteria</a>
(* .TXT)	TEXT	<a href="#">4.1.10 TEXT Measurement Criteria</a>

### 4.1.2 COBOL Measurement Criteria

COBOL measurement criteria are as follow.

#### Note Judgment

- The 7th column contains one of the following values.
  - "\*" General note line
  - "/" Page break specification
  - "D" Debug line
- The first line is one of the following values.
  - "@OPTIONS" Translation option specification
  - "PROCESS" Translation option specification

- "CBL" Translation option specification
- Embedded SQL statements.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- In-line notes from "\*">" to the end of the line.

#### Remarks

- The COBOL free source format is not supported.
- The program structures of .NET programming and object-oriented programming are not supported.
- In COBOL, blank lines are lines containing only line numbers or lines whose 7th and following digits contain only one-byte or two-byte blank spaces and tabs.

### Library Judgment

- Library (COPY) judgment is performed as follows.
  - COPY .....
- Library (INCLUDE) judgment is performed as follows.
  - INCLUDE .....

#### Remarks

- If the file name including the extension is specified with the word COPY or INCLUDE, files not having the extensions specified in [New Measurement](#) are also measured.
- One or more blank spaces or tabs must be inserted between the word COPY or INCLUDE and the library file name. In addition, if inserted, a line break will constitute a target file limitation.
- Embedded SQL include files (EXEC SQL INCLUDE) and embedded SQL libraries are not regarded as the targets of embedded members.
- The "SUBSCHEMA Name" for AIM DB use is not measured as a library.

### Declaration Division and Execution Division Judgment

- The criterion for declaration division judgment is shown below.
  - From "IDENTIFICATION DIVISION", including the head of the source file, to the line preceding "PROCEDURE DIVISION."
- The criterion for execution division judgment is shown below.
  - From "PROCEDURE DIVISION" to the end of the source file.

#### Remarks

- The start of the identification division (word IDENTIFICATION DIVISION) and the start of the procedure division (word PROCEDURE DIVISION) must be described in the source file of the target COBOL program. If either of or both of these are not described or are described in a COPY phrase library file, STEPCOUNTER cannot perform measurement properly.
- If the "Measure by program ID" option of [Step Measurement - Measure] is selected, the range from "IDENTIFICATION DIVISION" to the line preceding the next "IDENTIFICATION DIVISION" is regarded as one program, and the main program and subprograms are measured.  
If programs have been nested, the end program statement of the outermost program increases steps as the last detected program measurement result.  
The file name and the program IDs are displayed in the output measurement results.
- If the "Measure by program ID" option of [Step Measurement - Measure] is not selected, only the main program is measured. However, the range measured as the main program is the set of lines before the "IDENTIFICATION DIVISION" of a subprogram. Only the file name is displayed in the output measurement results.

### Embedded SQL Judgment (COBOL)

ANSI standard-compliant SQL syntax is shown below. (ORACLE, RDB II, Informix, etc.)

## 1. Declaration Section

EXEC SQL BEGIN DECLARE SECTION END-EXEC	+
01 ~ +	
01 ~   - Host variable, indicator variable declaration	- Declarations are also counted as embedded SQL.
01 ~ +	(5 steps)
EXEC SQL END DECLARE SECTION END-EXEC	+

## 2. Others

EXEC SQL +
~   - The range from "EXEC SQL" to "END-EXEC" is counted as embedded SQL.
END-EXEC + (3 steps)

- If a "hyphen (-)" appears twice continuously in embedded SQL, the relevant line to the end of the line is regarded as a note.

- One or more blank spaces or tabs must be inserted between the word EXEC and the word SQL. In addition, if inserted, a line break will constitute a target file limitation.

```

### 4.1.3 C/C++ Measurement Criteria

C/C++ measurement criteria are as follow. These measurement criteria are also applied to resource files, excluding the RDB section.

#### Note Judgment

- The steps enclosed by a "/\*" and "\*/" pair. (C, C++)
- From "/\*" to the end of the line. (C++)
- Embedded SQL statements. (C)
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- Lines with only "{" and "}" are described. (If the [Measure lines with only "{" & "}" as comments] option is selected. However, lines with " { }" are regarded as valid lines.)

#### Include Judgment

- #include <.....>
- #include "....."
- #include .....
- rcinclude .....

#### Remarks

- #include must be lowercase.
- Embedded SQL include files (EXEC SQL INCLUDE) are not regarded as the targets of embedded members.
- Embedded SQL include statements (such as #include) are not regarded as the targets of embedded members.

## Embedded SQL Judgment (C)

ANSI standard-compliant SQL syntax (such as ORACLE, RDB II, and Informix) or Informix ESQL/C-compliant syntax.

- From "EXEC SQL" to "; (semicolon)".
- Lines in the range of "EXEC SQL BEGIN ~" to "EXEC SQL END ~".
- From "\$" to "; (semicolon)".
- If a "hyphen (-)" appears twice continuously in embedded SQL, the relevant line to the end of the line is regarded as a note.

### Remarks

- "EXEC SQL" must be uppercase.
- One or more blank spaces or tabs must be inserted between the word EXEC and the word SQL. In addition, if inserted, a line break will constitute a target file limitation.
- C/C++ variables whose names include "\$" are regarded as SQL lines. To prevent measurement of SQL, if necessary, change the [\[Step Measurement - Measure\] option](#) setting.

	*/ if(kouza_code[0]='e') exit(0);
	}

```
}
[EOF]
```

## 4.1.4 Java Measurement Criteria

Java measurement criteria are as follow.

### Note Judgment

- The steps enclosed by a "/" and "/" pair.
- From "/" to the end of the line.
- The steps enclosed by a "/\*" and "\*/" pair. (Javadoc comment)
- Embedded SQL statements.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- Lines with only "{" and "}" are described. (If the [Measure lines with only "{" & "}" as comments] option is selected. However, lines with " {" }" are regarded as valid lines.)

### Embedded SQL Judgment (Java)

- From "#sql" to ";" (semicolon).

```
#sql *** ** ;
#sql *** = { *** } ;
#sql { *** } ;
```

To the first ";" (semicolon) if "{} (braces)" are absent.

To the first "};" if "{} (braces)" are present.

No "{ }" nesting.

- If a "hyphen (-)" appears twice continuously in embedded SQL, the relevant line to the end of the line is regarded as a note.

                   throws SQLException {
                   System.out.println("static update-returning for empno " + empno);
                   String ename;
SQL Statement      #sql { begin
SQL Statement      update emp set sal = :newSal
SQL Statement      where empno = :empno
SQL Statement      returning ename into :OUT ename; -- :OUT is for SQLJ bind
Comment            -- :OUT is for SQLJ bind
SQL Statement      end;
SQL Statement      };
SQL Statement      System.out.println("Update the salary of employee " + ename);
                   }
Comment            }
                   [EOF]

```

## 4.1.5 Auto-generated Java Source Measurement Criteria

Auto-generated Java source measurement criteria are as follow.

### Note Judgment & Embedded SQL Judgment (Java)

- Based on [Java Measurement Criteria](#).

### Handwritten & Auto-generation Judgment

- Handwritten and auto-generation are judged based on the [Step Measurement - Auto-detection (Java)] option settings. The range from the line following the start identifier to the line prior to the end identifier is measured as handwritten and the other sections are measured as auto-generation.
- Automatic identifiers are searched for using a prefix search.
- The following identifiers are exempt from judgment, so caution is necessary.
  - Start identifiers and end identifiers nested within a start identifier and end identifier pair
  - The end identifier from an invalid start and end identifier combination
  - An end identifier whose corresponding start identifier is absent
- The result of the measurement of source containing no pairs of automatic identifiers is measured entirely as an auto-generated source (embedded steps).

### Remarks

- When measurement results are output, auto-generated sections are output as step information.
- For identifiers pre-registered as standard, refer to [5.11.6 \[Step Measurement - Auto-detection \(Java\)\] Option Settings](#).

### Measurement Judgment Examples

## 4.1.6 IDL Measurement Criteria

IDL measurement criteria are as follow.

### Note Judgment

- The steps enclosed by a "/" and "/" pair.
- From "/" to the end of the line.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- Lines with only "{" and "}" are described. (If the [Measure lines with only "{" & "}" as comments] option is selected. However, lines with " {" }" are regarded as valid lines.)

### Measurement Judgment Examples

```

Comment    /*
Comment    ** Step Measurement   IDL Source Measurement Examples
Comment    ** ALL Rights Reserved Copyright FUJITSU LIMITED 2004
Comment    */

```

```

module Module1 {
Comment
Comment      // Java interface declaration
              interface Func1 {
                  typedef long otype;
                  exception FuncException { //Exception declaration
Comment
                  //Exception declaration
                  string reason;
                  };
Comment
                  otype Open(in string name)
                      raises(FuncException);
                  readonly attribute long data;
                  typedef Object FuncObject;
              }
}
[ EOF ]

```

### 4.1.7 HTML/JSP/JS/CSS Measurement Criteria

HTML/JSP/JS/CSS measurement criteria are as follow.

#### Note Judgment

- The steps enclosed by a "<!--" and "-->" pair in an HTML or JSP file. (\*1, \*2)
- The steps enclosed by a "<comment>" and "</comment>" pair in an HTML or JSP file. (\*2)
- The steps enclosed by a "<%--" and "--%>" pair in a JSP file. (\*2)
- The steps with "/" at the beginning in the range enclosed by a "<% " and "%>" pair in a JSP file.
- The steps enclosed by a "/\*" and "\*/" pair in the range enclosed by a "<% " and "%>" pair in a JSP file.
- The steps within the <SCRIPT> tag in an HTML or JSP file. (\*3)
- The steps within the <STYLE> tag in an HTML or JSP file.
- The steps with "/" at the beginning in a JS or CSS file.
- The steps enclosed by a "/\*" and "\*/" pair in a JS or CSS file.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- Lines with only "{" and "}" are described. (If the [Measure lines with only "{" & "}" as comments] option is selected. However, lines with " { }" are regarded as valid lines.)

\*1: If JavaScript or VBScript is specified as the "language" or "type" attribute value in the <SCRIPT> tag, statements enclosed by a "<!--" and "-->" pair are measured as comments in each script/language.

If a script other than the above is specified, a measurement error will occur and the range of <SCRIPT> to </SCRIPT> will be measured as a comment line.

\*2: The comment notation within the <XMP> tag and the comment notation after the <PLAINTEXT> tag are exempt and are measured as valid lines.

\*3: If a "language" and "type" attribute value is omitted in the <SCRIPT> tag, the statement within the <SCRIPT> tag is measured as a JavaScript comment.

#### Remarks

- For accurate measurement, a <SCRIPT> tag declaring the "language" or "type" attribute must be described in one line. If a line break is inserted in the middle of the <SCRIPT> tag, the script attribute of the <SCRIPT> tag specified previously is used in measurement.

Valid      </HTML>
Valid      [EOF]
```

### 4.1.8 .NET (ASP/C#/VB)/HTML/JS/CSS Measurement Criteria

ASP.NET, C#, and VB.NET resources and HTML, JS, and CSS can be included in measurement.

(Hereinafter, this manual abbreviates ASP/ASP.NET as ASP and Visual Basic/Visual Basic.NET as VB.)

.NET (ASP/C#/VB)/HTML/JS/CSS measurement criteria are as follow.

#### Note Judgment

- The steps enclosed by a "<!--" and "-->" pair in an ASP or HTML file. (\*1, \*2)
- The steps enclosed by a "<comment>" and "</comment>" pair in an ASP or HTML file. (\*2)
- The steps enclosed by a "<%--" and "--%>" pair in an ASP file. (\*2)
- The steps enclosed by a "<% " and "%>" pair in an ASP file. (\*3)
- The steps within the <SCRIPT> tag in an ASP or HTML file. (\*4)
- The steps within the <STYLE> tag in an ASP or HTML file.
- The steps with "/" at the beginning in a C#, JS, or CSS file.
- The steps enclosed by a "/\*" and "\*/" pair in a C#, JS, or CSS file.
- The steps with "Rem" at the beginning in a VB or VBScript file.

- The steps with "'" (apostrophe)" at the beginning in a VB or VBScript file.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)
- Lines with only "{" and "}" are described. (If the [Measure lines with only "{" & "}" as comments] option is selected. However, lines with " { }" are regarded as valid lines.)

\*1: If C#, VB, JavaScript, VBScript, or JScript is specified as the "language" or "type" attribute value in the <SCRIPT> tag, statements enclosed by a "<!--" and "-->" pair are measured as comments in each script/language. If a script other than the above is specified, a measurement error will occur and the range of <SCRIPT> to </SCRIPT> will be measured as a comment line.

\*2: The comment notation within the <SCRIPT> tag, the <STYLE> tag, the <XMP> tag, a "<%@" and "%>" pair, and a "<% " and "%>" pair and the comment notation after the <PLAINTEXT> tag are exempt and are measured as valid lines.

\*3: If C#, VB, JavaScript, VBScript, or JScript is specified by the @language directive, statements enclosed by a "<% " and "%>" pair are measured as comments in each script/language. If the @language directive is omitted, statements enclosed by a "<% " and "%>" pair are measured as VBScript comments.

\*4: If a "language" and "type" attribute value is omitted in the <SCRIPT> tag, statements within the <SCRIPT> tag are measured according to the script attribute specified by the @language directive.

#### Remarks

- For accurate measurement, a <SCRIPT> tag declaring the "language" or "type" attribute must be described in one line. If a line break is inserted in the middle of the <SCRIPT> tag, one of the following script attributes is used in measurement.
  - When it is an ASP file
 

Depending on the line break position of the <SCRIPT> tag, the script attribute specified by the @language directive or the script attribute of the <SCRIPT> tag specified previously is used in measurement.
  - When it is an HTML file
 

The script attribute of the <SCRIPT> tag specified previously is used in measurement.
- Script attributes that can be specified in the <SCRIPT> tag or the @language directive vary depending on the extension of the measured asset.

Extension	Target Script
*.asp	JavaScript, VBScript, JScript
*.asax, *.ascx, *.aspx	C#, VB, JavaScript, VBScript, JScript
*.htm, *.html	JavaScript, VBScript, JScript

## 4.1.9 Visual Basic 6.0 Measurement Criteria

Visual Basic 6.0 measurement criteria are as follow.

### Note Judgment

- The steps with "Rem" at the beginning.
- The steps with "'" (apostrophe)" at the beginning.
- Blank lines. (If the [Measure blank lines as comments] option is selected.)

## Handwritten & Auto-generation Judgment

- Handwritten and auto-generation are judged based on the [Step Measurement - Auto-detection (VB6.0)] option settings. The range from the start identifier line to the end identifier line is measured as auto-generation and the other sections are measured as handwritten. This is the opposite to the auto-generated Java source measurement criterion, so caution is necessary.
- Automatic identifiers are searched for using a prefix search.
- The following identifiers are exempt from judgment, so caution is necessary.
  - Start identifiers and end identifiers nested within a start identifier and end identifier pair
  - The end identifier from an invalid start and end identifier combination
  - An end identifier whose corresponding start identifier is absent
- The result of the measurement of source containing no pairs of automatic identifiers is measured entirely as a handwritten source (handwritten steps).

### Remarks

- When measurement results are output, auto-generated sections are output as step information.
- For identifiers pre-registered as standard, refer to [5.11.7 \[Step Measurement - Auto-detection \(VB 6.0\)\] Option Settings](#).

## 4.1.10 TEXT Measurement Criteria

---

TEXT measurement criteria are as follow.

### Note Judgment

- Blank lines. (If the [Measure blank lines as comments] option is selected.)

### Measurement Judgment Examples

Judgment	Source Program Description (sample.txt)
	<pre>/* ** Step Measurement Text File Measurement Examples ** ALL Rights Reserved Copyright FUJITSU LIMITED 2014 */ text TEXTModule1 {</pre>
Comment	<pre>    // Declaration     text Funcl {         long type;         exception txtException {             //Exception declaration             return -1;         };     }</pre>
Comment	<pre>    } } [EOF]</pre>

## 4.2 Variation Measurement Criteria

---

Variation measurement criteria are as follow. Refer also to the advisory notes.

-> [Advisory Notes](#)

### About Target Files/Folders

In file specification and folder specification, specify a pair of old and new files/folders.

- In the case of file specification, the old and new file names can be different.
- In the case of folder specification, files with the same names in the old and new folders are compared. If some old and new file names are inconsistent, for example, in the case of non-corresponding subfolders, the variation steps of each file are only deletions or insertions.

### Valid Lines & Comment Lines

- Valid line and comment line judgment is in accordance with the measurement criteria of each language category.
- As the measurement method is different from that of Step Measurement, the results do not match with the valid/comment steps from Step Measurement.
  - Depending on the [Consider comment range] option setting, the measurement method varies (See "Comparison Options" below).
    - > Step Measurement always performs measurement considering comment range.
    - If a valid section and a comment section are present in one line, each valid section and comment section is measured as a variation.
      - > Step Measurement measures this line as a valid step.

Using the variation measurement results, comment lines can be derived with the following formula.

[Number of Comment Lines Equal to Step Measurement Results] = [Total Steps] - [Valid Steps when "Consider comment range" Is On]

- Note that the methods of measuring some lines such as blank lines and lines with only "}" may vary depending on the [\[Measure Variation - Measure\] Option Settings](#).

### Insertion/Variation/Deletion Judgment

- The old and new files are compared in a manner that derives the maximum number of matching lines.
- Lines in the old file judged as mismatching are regarded as deleted lines, and lines in the new file judged as mismatching are regarded as inserted lines.
- If mismatching lines include consecutive deletions/insertions, the section of mismatched text that has fewer consecutive lines of deletion/insertion is regarded as "variation lines".
  - \* Lines that are inconsistent between old and new files and that are valid lines in the old file and comment lines in the new file do not meet the condition for variation. Refer to [Non-variation Judgment Examples].
- If valid lines are commented out, the comment out is regarded as valid line deletion and comment line insertion, but "variation lines" are not counted.

[Judgment Examples]

Old Source	New Source	Judgment Result
a = 0; //Default value	a = 1; //Default value	Valid line variation
b = 0; //Default value	b = 0;	Comment line deletion
c = 0;	// c = 0;	Valid line deletion and comment line insertion

[Variation Line Judgment Examples 1]

Old Source	New Source	Judgment Result
//Variable definition	//Variable definition	Matching
int a;	int X;	"int a;" deletion and "int X;" insertion correspond -> Variation line
int b;	int Y;	"int b;" deletion and "int Y;" insertion correspond -> Variation line
int c;	(No line)	"int c;" deletion only -> Deleted line
//Initialization process	//Initialization process	Matching

[Variation Line Judgment Examples 2]

Old Source	New Source	Judgment Result
int a = 0;	int a = 1;	Valid line variation
(No line)	int b = 2;	Valid line insertion
//Variable initialization	//Variable initialization	Matching
int c = a++;	int d = a + b;	"int c = a++;" deletion and "int d = a + b;" insertion correspond -> Variation line
int d = a + 2;	(No line)	Valid line deletion

[Non-variation Judgment Examples]

Old Source	New Source	Judgment Result
a = 0;	//Variable initialization	Valid line deletion and comment line insertion
	a = 1;	Valid line insertion

## Comparison Options

- During the comparison of old and new files, options such as whether to consider blank spaces between words and whether to distinguish between uppercase and lowercase letters use the [\[Measure Variation - Measure\] Option Settings](#).
- The [\[Consider comment range\]](#) option specifies whether to consider lines that are not regarded as comments, such as C/C++ and Java /\* ~ \*/ comments, but are included in the comment range, as comments.

[Differences in Judgment Depending on Options]

Example	Not Considered	Considered
/* Comment out the next process	Comment line	Comment line
a = a + 1;	<b>Valid line</b>	Comment line
*/	Comment line	Comment line

Refer to the 24th to 30th lines in the following measurement judgment example.

## Measurement Judgment Examples

This section provides Java source judgment examples based on the following variation measurement options.

- Valid lines and comment lines are measured
- Blank lines are measured
- Lines with only "{" & "}" are not measured as comments

[If the comment range is not considered]

Valid	Comment	No.	Old File	New File
		1	public class CompSample {	public class CompSample {
	Insertion	2	int memory;	int memory; //Previous calculation results
		3	/**	/**
Variation		4	* @param args	* @version 1.0
Insertion		5	(No line)	* @param Calculate from arguments 1 and 2
		6	*/	*/
		7	public static void main(String[] args) {	public static void main(String[] args) {
	Variation	8	//TODO Auto-generated method	//Instance generation
		9	CompSample cs	CompSample cs
		10	= new CompSample();	= new CompSample();
	Variation	11		//Execute
Variation		12	int a = 10;	int a = Integer.parseInt(args[0]);
Variation		13	int b = 20;	int b = Integer.parseInt(args[1]);
		14	System.out.println( cs.add(a, b) );	System.out.println( cs.add(a, b) );

Valid	Comment	N o.	Old File	New File
Deletion	Insertion	1 5	System.out.println( cs.sub(a, b) );	//System.out.println( cs.sub(a, b) );
		1 6	}	}
		1 7		
		1 8	//Addition method	//Addition method
		1 9	public int add(int a, int b) {	public int add(int a, int b) {
Variation	Insertion	2 0	return a+b;	memory = a + b; //Store addition results
Insertion		2 1	(No line)	return memory;
		2 2	}	}
		2 3		
	Insertion	2 4	(No line)	/*
		2 5	//Subtraction method	//Subtraction method
		2 6	public int sub(int a, int b) {	public int sub(int a, int b) {
	Insertion	2 7	memory = a - b;	memory = a - b; //Store subtraction results
		2 8	return memory;	return memory;
		2 9	}	}
	Insertion	3 0	(No line)	*/
		3 1	}	}

\* As for the 11th line, it is considered as a blank line has been modified to a "//Execute" comment (Blank lines are comment lines).

[Measurement Results]

Valid			Comment		
Insertion	Variation	Deletion	Insertion	Variation	Deletion
2	4	1	6	2	0

[If the comment range is considered]

The commented out 3rd to 6th lines and 24th to 30th lines are judged as follows.

Valid	Comment	No.	Old File	New File
		3	/**	/**
	Variation	4	* @param args	* @version 1.0
	Insertion	5	(No line)	* @param Calculate from arguments 1 and 2
		6	*/	*/
...	...	...	...	...
	Insertion	24	(No line)	/*
		25	//Subtraction method	//Subtraction method
Deletion	Insertion	26	public int sub(int a, int b) {	public int sub(int a, int b) {
Deletion	Insertion	27	memory = a - b;	memory = a - b; //Store subtraction results
Deletion	Insertion	28	return memory;	return memory;
Deletion	Insertion	29	}	}
	Insertion	30	(No line)	*/

As the contents of the 26th to 29th lines in the new file are regarded as comments, valid line deletions and comment insertions are counted, even if no modifications were made.

[Measurement Results]

Valid			Comment		
Insertion	Variation	Deletion	Insertion	Variation	Deletion
1	3	5	10	3	0

# Chapter 5 Operation Description

This chapter explains how to operate MF-STEP COUNTER.

## 5.1 Starting and Stopping

This section explains how to start and stop MF-STEP COUNTER.

### How to Start

Start [SIMPLIA MF-STEP COUNTER] from the Start menu.

### How to Stop

To stop MF-STEP COUNTER, select "File" on the menu bar and select [Exit SIMPLIA MF-STEP COUNTER] from the pull-down menu. When data has been changed, a confirmation message asking whether to save the changes is displayed.

## 5.2 New Measurement

The following three methods are available for asset measurement.

Measurement Method	Description
Step Measurement	Measures the scale of the asset dividing it into valid steps and comment steps.
Variation Measurement	Measures deleted/modified/inserted steps by comparing the current asset and the past asset.
Java Software Metrics Measurement	This function measures the complexity of classes and methods from Java source files and class files.

For details on Java Software Metrics Measurement, refer to the user's guide for the "Java Software Metrics Measurement function".

### To Measure Steps

1. To perform C/C++ or COBOL asset measurement, including include, copy phrase, and other [embedded file steps](#), first go to the [\[Step Measurement - Search Path\] Option Settings](#) and specify the include file, copy phrase file, and other measured file paths. In addition, in the [\[Step Measurement - Measure\] Option Settings](#), select [Measure embedded members]. However, if this is enabled, it will take a very long time to complete measurement because program file and embedded file relationships are analyzed, and therefore, the targets of measurement should be narrowed down. (\*1)
2. Select the [New Measurement] command from the [File] menu.
3. In the [New Measurement 1/2 Dialog Box](#), select [Steps] under [Measurement Type]. Select [Language Category], [Target Asset Specification Method], and [Character Code], and click the [Next] button.
4. In the [New Measurement 2/2 Dialog Box](#), specify the measurement target source file or the folder in which the source file is located.
5. Specify all measurement targets, and click the [Finish] button. After measurement, the measurement results are displayed on screen.

\*1: To skip the analysis of program file and embedded file relationships and rapidly measure the steps of embedded files, without performing the above step 1, select [File] under [Target Asset Specification Method] in step 3, set [Files of Type] to [All Files By Language Identifier] when selecting source files in step 4, and perform measurement.

### To Measure Variation

1. Select the [New Measurement] command from the [File] menu.
2. In the [New Measurement 1/2 Dialog Box](#), select [Variations] under [Measurement Type]. Select [Language Category], [Target Asset Specification Method], and [Character Code], and click the [Next] button.

3. In the [New Measurement 2/2 Dialog Box](#), specify the old and new measurement target source files or the folders in which the source files are located.(\*2)

4. Specify all measurement targets, and click the [Finish] button. After measurement, the measurement results are displayed on screen.

\*2: Old and new files with different names can be compared if "File" is selected for the target resource specification method, but only files with the same name are compared if "Folder" is selected. To include subfolders in the measurement, the subfolders must also have the same name.

### Attention

Depending on the selected language category, measurement is performed using one of the following languages, based on the file extension. The type column shows the names displayed in the "Type" field in the Program step information (List view) dialog.

The extension column shows the extensions set during installation. Use the [Common - Extension] option to make changes.

If the same extension has been assigned to multiple types, the language type that comes higher in the following table (except for Auto-detection) is considered to be the language used for measurement.

Language Category	Type	Extension
Auto-detection	Identifies the type automatically based on the extension of the target file.	The extensions that can be specified for each language
COBOL	COBOL	(* .CBL), (* .COB), (* .COBOL), (* .SCOB), (* .PCO)
C/C++	C/C++	(* .C), (* .CPP), (* .H), (* .RC) (* .H depends on the <a href="#">[Step Measurement - Measure] Option Settings</a> .)
Java Auto-generated Java Source	Java Class Java Interface	(* .JAVA)
	SQLJ	(* .SQLJ)
IDL	IDL	(* .IDL)
HTML/JSP/JS/CSS (*3)	HTML	(* .HTML), (* .HTM)
	JSP	(* .JSP), (* .JSPF), (* .TAG), (* .TAGX), (* .TAGF)
	VB.NET	(* .VB)
	VBScript	(* .VBS)
	JavaScript	(* .JS)
	StyleSheet	(* .CSS)
.NET (ASP/C#/VB)/ HTML/JS/CSS (*3)	ASP.NET	(* .ASP), (* .ASAX), (* .ASCX), (* .ASPX)
	C#	(* .CS)
	VB.NET	(* .VB)
	VBScript	(* .VBS)
	HTML	(* .HTML), (* .HTM)
	JScript	(* .JS)
	StyleSheet	(* .CSS)
Visual Basic 6.0	VB 6.0	(* .FRM), (* .BAS), (* .CLS), (* .CTL), (* .PAG), (* .DSR)
TEXT	TEXT	(* .TXT)

\*3: "JS" is the abbreviation of "JavaScript" and "JScript".

"CSS" is the abbreviation of "Cascading Style Sheets".

## 5.3 Edit Assets List

---

Edit the specified asset list.

As shown below, edit an asset list, and measure all or only the changed.

1. Re-edit the asset list specified for new measurement.
2. Edit the asset list after the reading of a measurement results file.
3. Edit the asset list after measurement.

### To Edit the Asset List

1. Select the [Edit Assets List] command from the [File] menu.
2. In the case of step measurement, set the necessary items in the [Edit Assets List Dialog Box](#).
3. In the case of variation measurement, set the necessary items in the [Edit Assets List Dialog Box](#) that provides old and new file lists.
4. After specification is complete, click the [OK] button.

After this procedure, start measurement from [\[Measure All\]](#) or [\[Measure Changed\]](#) and have the measurement results displayed on screen.

### Attention

If the OK button is clicked after editing assets, the measurement results that have been displayed on screen are discarded unconditionally, even if they are unsaved.

The displayed dialog (file or folder) depends on the method selected for new measurement under [Target Resource Specification Method] in the [New Measurement 1/2 Dialog Box](#).

## 5.4 Reading Measurement Results Files

---

Read the measurement results file to be measured, displayed, and edited.

### To Read a File

1. Select the [Read] command from the [File] menu.
2. In the [Read Measurement Results File] dialog box, select the measurement results file and click the [Open] button.
3. The measurement results saved in the measurement results file are displayed on screen.

## 5.5 Measurement Results File Saving Method (Save As)

---

Save a file resulting from new measurement, or save an existing measurement results file as a new file with a new name.

### To Save a File

1. Select the [Save As] command from the [File] menu.
2. In the [Save Measurement Results File] dialog box, specify the measurement results file name and click the [Save] button.
3. A measurement results file with the specified name is created.

Related items

[5.6 Measurement Results File Saving Method \(Save\)](#)

## 5.6 Measurement Results File Saving Method (Save)

---

Update and save the original measurement results file after remeasurement.

### To Save a File

1. Select the [Save] command from the [File] menu.
2. The measurement results file is overwritten with new measurement results.

Related items

[5.5 Measurement Results File Saving Method \(Save As\)](#)

## 5.7 CSV File Creation (Selected Range)

---

Save only the selected range of the measurement results as a [List View CSV File](#).

### To Save a File

1. Select the measurement results to be output to a CSV file from the list view (multiple selections are possible).
2. Select the [Save Selected Range As CSV File] command from the [File] menu.
3. In the [Save As CSV File] dialog box, specify the CSV file name and click the [Save] button.
4. A CSV file with the specified name is created.

#### Attention

- When the measurement results are displayed in the list view and only total or average lines are selected, this command is disabled.
- When [Save Selected Range As CSV File] is executed, average and total values are derived only from the information output to a CSV file.

Related items

[5.8 CSV File Creation](#)

## 5.8 CSV File Creation

---

Save the measurement results as a CSV file. Depending on the display method for measurement results, the saved format varies.

- [5.8.1 Form CSV File](#)
- [5.8.2 List View CSV File](#)

### To Save a File

1. Select the [Save As CSV File] command from the [File] menu.
2. In the [Save As CSV File] dialog box, specify the name for the CSV file and click the [Save] button.
3. A CSV file with the specified name is created.

Related items

[5.7 CSV File Creation \(Selected Range\)](#)

### 5.8.1 Form CSV File

---

Although a measurement results file is normally saved in a dedicated format for STEPCOUNTER to read and write, it is possible to use [Save As CSV File] to save it as a "CSV (Comma Separated Value)" file. However, STEPCOUNTER cannot reload saved CSV files. In addition, only part of the content of the form image is output.

#### CSV File Output Format

0,	"c:\test\",	"PROG0001",	318,	11,	0,	0,	519,	27,	0,	0,	0
0,	"c:\test\",	"PROG0002",	613,	24,	0,	0,	768,	33,	0,	0,	0
:											
2,	"c:\test\",	"ZCOPY01",	86,	5,	0,	0,	0,	0,	0,	0,	0
2,	"c:\test\",	"ZCOPY02",	56,	8,	0,	0,	0,	0,	0,	0,	0
:											
1,	"c:\test\",	"ZINC000",	46,	3,	0,	0,	0,	0,	0,	0,	0
1,	"c:\test\",	"ZINC001",	81,	3,	0,	0,	0,	0,	0,	0,	0
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)

No.	Output Item	Description
(1)	File Type	0: C/C++ source file or COBOL source file 1: C/C++ include file or COBOL include file 2: COBOL copy library file 4: Resource include file 5: Java/SQLJ source file 6: IDL source file 7: HTML source file 8: JSP source file 9: JS source file 10: CSS source file 11: ASP.NET source file 12: C# source file 13: VB.NET source file 14: VBScript source file 15: Visual Basic 6.0 source file 16: Text file
(2)	Folder Name	Output if [Output file path] is specified as a form option; blank if not specified; and enclosed in double quotes (")
(3)	File Name	The measured file name, enclosed in double quotes (")
(4)	Declaration Division Actual Steps	Number of actual steps in the COBOL declaration division 0 in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(5)	Declaration Division Comment Steps	Number of comment steps in the COBOL declaration division 0 in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(6)	Declaration Division Blank Steps	Number of blank steps in the COBOL declaration division 0 in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(7)	Declaration Division SQL Steps	Number of embedded SQL steps in the COBOL declaration division 0 in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(8)	Execution Division Actual Steps	Number of actual steps in the COBOL execution division Number of actual steps in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(9)	Execution Division Comment Steps	Number of comment steps in the COBOL execution division Number of comment steps (including Javadoc comments) in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT
(10)	Execution Division Blank Steps	Number of blank steps in the COBOL execution division 0 in the case of C/C++, Java/SQLJ, IDL, HTML, ASP, VB 6.0, or TEXT

No.	Output Item	Description
(11)	Execution Division JavaDoc Steps	Number of Java/SQLJ Javadoc comment steps 0 in the case of COBOL, C/C++, IDL, HTML, ASP, VB 6.0, or TEXT
(12)	Execution Division SQL Steps	Number of embedded SQL steps in the COBOL execution division Number of embedded SQL steps in the case of C/C++ or SQLJ 0 in the case of Java, IDL, HTML, ASP, VB 6.0, or TEXT

### Attention

- Regardless of the [Document / Measurement Type] setting in the [Step Measurement - Measure] Option Settings, only program step information is output.
- SQL steps are always output regardless of the [Output SQL information] form option setting.

## 5.8.2 List View CSV File

Although a measurement results file is normally saved in a dedicated format for STEPCOUNTER to read and write, it is possible to use [Save As CSV File] to save it as a "CSV (Comma Separated Value)" file. However, STEPCOUNTER cannot reload saved CSV files. Essentially, the information displayed in the list view is output in that format.

### CSV File Output Example

```

***** SIMPLIA MF-STEP COUNTER ***** 08/09/2000 09:29:18 [UNICODE]"
"Program step information"
"File", "Total Steps", "Handwritten Steps", "Embedded Steps",
"File Name", "Valid", "Subtotal", "Valid", "Subtotal", "Valid", "Subtotal"
"CMFSTP32.cpp", 4014, 6164, 1613, 2073, 2401, 4091
"Total", 4014, 6164, 1613, 2073, 2401, 4091
"Average", 4014, 6164, 1613, 2073, 2401, 4091

"Information of embedded member steps (include)"
"File", "Breakdown of Steps",
"File Name", "Valid", "Subtotal"
"childfrm.h", 23, 53
"cmfstp32.h", 99, 161
"Total", 122, 214
"Average", 61, 107

```

### About the Title Line

- [Title], [Date and Time Created], and [Character Code] are output. For [Character Code], the character code (Shift JIS or Unicode) specified for new measurement is output.

Output Item	Description
Date and Time Created	Date and Time Created CSV File. The display format with update is different according to the form of the region and the language of OS setting. When [Japanese (Japan)] is selected, it displays it by [yyyy/MM/dd HH:mm:ss]. It displays it by [MM/dd/yyyy HH:mm:ss] when selecting it excluding [Japanese (Japan)].

### About Detail Lines

- The output target is only the data displayed in the list view dialog. Therefore, if the data displayed has been narrowed down to the contents of the folder specified in the [Display Folder] combo-box, only that data will be output.

### About Output Items

- If [Do not output hidden items] is specified as a [CSV File] option, the output of items hidden in the list view dialog is prevented.

- For details on each item, refer to [Chapter 7 Description of Measurement Results](#).

#### About Average and Total Lines

- When [Save Selected Range As CSV File] is executed, average and total values are derived only from the information output to a CSV file. If [Do not output average, or total lines] is specified as a [CSV File] option, these lines are not output.

## 5.9 Printing Measurement Results

---

If the dialog is displayed in form mode, it is possible to print the contents using the following procedure.

If it is displayed in list view mode, perform [CSV file output](#), and print the results using an application such as spreadsheet software.

### To Print Measurement Results

1. Select the [Print] command from the [File] menu.
2. In the [Print Dialog Box](#), set the necessary items and click the [OK] button.
3. The measurement results are sent to the printer.

Item	Description
Current Printer	Displays the currently selected printer.
Document Type / Print Range	Displays the selected document type for printing and the print range of each document.
Printing Range	Specifies the print range for each document. (If the Specify button is depressed)
Number of copies	Specifies the number of copies of each document to print. (If the Specify button is depressed)
Printer Settings	Enables configuration of printer settings.

#### Attention

Referring to the printer manual for printer-specific settings, configure the settings that match the printer's capabilities.

This command is only enabled when the measurement results are displayed in form mode.

## 5.10 Step Measurement

---

This section explains how to operate Step Measurement.

### 5.10.1 Step Measurement (Measure All)

---

This method newly measures all target files and displays the measurement results.

#### To Measure All

1. Select the [Measure All] command from the [Measure] menu.
2. Measurement is started, and the measurement results are displayed on screen.

### 5.10.2 Step Measurement (Measure Changed)

---

This method measures only assets added in the process of [Edit Assets List] and displays the measurement results. If no assets were added and only options were edited, it only displays the measurement results based on the updated options, without performing remeasurement.

#### To Measure Changed

1. Select the [Measure Changed] command from the [Measure] menu.
2. Measurement is started, and the measurement results are displayed on screen.

## Attention

In the following cases, measurement of the changed sections cannot be performed.

1. When performing new measurement
2. When assets have been deleted through asset list editing
3. When search paths have been added/deleted by setting [Step Measurement - Search Path] options
4. When the setting of [Measure embedded members] as a [Step Measurement - Measure] option has been changed
5. When the setting of [Measure embedded SQL] as a [Step Measurement - Measure] option has been changed
6. When the setting of [Search in sub folders] as a [Step Measurement - Measure] option has been changed
7. When the setting of [Measure blank lines] as a [Step Measurement - Measure] option has been changed
8. When the setting of [Measure blank lines as comments] as a [Step Measurement - Measure] option has been changed
9. When the setting of [Measure lines with only "{" & "}"] as comments] as a [Step Measurement - Measure] option has been changed
10. When the setting of [Measure header files (\*.h) when the folder is specified] as a [Step Measurement - Measure] option has been changed
11. When the setting of [Measure by program ID] as a [Step Measurement - Measure] option has been changed from "enabled" state to "disabled"

## 5.11 Options Settings

---

This section explains how to set various options.

### 5.11.1 [Step Measurement - Measure] Option Settings

---

Configure the settings for the types of measurement results from step measurement to be output and the measurement method.

#### To Configure Settings

1. Select the [Step Measurement - Measure] configuration command from the [Options] menu.
2. In the [Step Measurement - Measure] Options Dialog Box, set the necessary items.

Item	Description
[Output program step information]	Specify whether to output program source steps.
[Output step information of embedded members]	Specify whether to output steps of embedded members expanded from the program source.
[Measure embedded members]	Specify whether to measure steps of embedded members.
[Measure embedded SQL]	Specify whether to measure embedded SQL steps separately.
[Search in sub folders]	Specify whether to target files located in subfolders for measurement when specifying assets by folder specification. (*1)
[Measure blank lines]	Specify whether to measure blank lines. Blank lines are measured if selected. Blank lines are not measured if not selected. (A blank line is a line of 0 bytes in length or a line consisting of only one-byte or two-byte blank spaces or tabs.)
[Measure blank lines as comments]	Select this to measure blank lines as comments. Blank lines are measured as blank lines if not selected. This is not selectable if blank lines are not to be measured. (A blank line is a line of 0 bytes in length or a line consisting of only one-byte or two-byte blank spaces or tabs.)

Item	Description
[Measure lines with only "{" & "}" as comments]	Change the method for measuring lines with only "{" & "}". Lines with only "{" & "}" are measured as comments if selected. However, lines with "{" }" are considered to be valid lines. Lines with only "{" & "}" are measured as valid lines if not selected.
[Measure by program ID]	Specify whether to perform measurement by program ID when the language category is COBOL. If one source file contains multiple programs, subprograms are also measured.
[Measure header files (*.h) when the folder is specified]	Specify whether to measure header files as program step information when the language category is C/C++. (*2, *3)

\*1: The [Search in sub folders] measurement option is applied only to program step measurement, and the search path for embedded member measurement includes only the specified folders.

\*2: If the language category is [Auto-detect], program step information is always measured and displayed.

\*3: If the [Measure embedded members] measurement option is enabled, this function is disabled. Header files are measured as embedded information.

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All] or [Measure Changed]. However, when changing [Measure embedded members], [Measure embedded SQL], [Search in sub folders], [Measure blank lines], [Measure blank lines as comments], [Measure lines with only "{" & "}" as comments], [Measure by program ID], or [Measure header files (\*.h) when the folder is specified], it is necessary to execute [Measure All].

## 5.11.2 [Step Measurement - Display] Option Settings

Set information related to the dialog display format and the list view dialog for step measurement. For details on the variation measurement related settings, refer to 5.11.9 [Measure Variation - Display] Option Settings.

### To Configure Settings

1. Select the [Step Measurement - Display] configuration command from the [Options] menu.
2. In the [Step Measurement - Display] Options Dialog Box, set the necessary items.

Item	Description
[Display Initial Dialog]	Specify whether to display the measurement results in the Form mode or the List view mode.
[Display file information]	Specify whether to initially display or hide the type, size, and update date of file information.
[Display SQL steps]	Specify whether to initially display or hide SQL and ETC of SQL information.
[Display SQL ratio]	Specify whether to initially display or hide the SQL ratio of SQL information.
[Display comments]	Specify whether to initially display or hide comment steps.
[Display comment ratio]	Specify whether to initially display or hide the comment ratio and the Javadoc ratio.
[Display embedded information]	Specify whether to initially display or hide items by embedded type for program information, and embedded information for embedded member information.
[Display folder name]	Specify whether to initially display or hide the folder name.
[Minimum Value of Comment Ratio]	Set the lower limit of the comment ratio. Comment ratios below the set value are indicated in red.

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All] or [Measure Changed]. When changing only the display format without performing measurement, execute [Measure Changed].

## 5.11.3 [Step Measurement - Search Path] Option Settings

---

It is possible to set up to 10 paths to folders in which embedded files expanded in the source program are located.

### To Configure Settings

1. Select the [Step Measurement - Search Path] configuration command from the [Options] menu.
2. In the [\[Step Measurement - Search Path\] Options Dialog Box](#), set the necessary items.

Item	Description
[Folder]	The name of the folder to be added is displayed and can also be entered here.
[Folder List]	A list of registered folder names is displayed.
[Browse]	Browse folder names.
[Add]	Select this to additionally register the folder name displayed in [Folder].
[Delete]	Select this to unregister a registered folder name.

### Attention

- To apply the changes to the measurement results, it is necessary to execute [Measure All].
- Duplicate registration of a single folder is not possible.
- The search order for measurement is the same as the order of registration.
- The folders in which measurement target files are located are automatically searched even if they are not registered in the search path.
- The order of priority in searches is the folders registered in the search path and then the folders in which asset files are located.
- The search path includes only the specified folders in searches, their subfolders are excluded.

## 5.11.4 [Step Measurement - CSV File] Option Settings

---

Set CSV file output related information.

### To Configure Settings

1. Select the [Step Measurement - CSV File] configuration command from the [Options] menu.
2. In the [\[Step Measurement - CSV File\] Options Dialog Box](#), set the necessary items.

Item	Description
[Do not output hidden items]	Specify whether to output hidden items.
[Do not output average, or total lines]	Specify whether to output average and total lines.

### Attention

These options are only enabled when the measurement results are displayed in list view mode.

## 5.11.5 [Step Measurement - Form] Option Settings

---

Set form dialog and form printing related information.

## To Configure Settings

1. Select the [Step Measurement - Form] configuration command from the [Options] menu.
2. In the [\[Step Measurement - Form\] Options Dialog Box](#), set the necessary items.

Item	Description
[Output file path]	Specify whether to output the folder name.
[Output SQL information]	Specify whether to output SQL step information regardless of the [Measure embedded SQL] setting in the [Step Measurement - Measure] options. Zeros are output if [Measure embedded SQL] is not checked.
[Output the update date of the file]	Specify whether to output the update date of the file.
[Note]	Set a note to be printed on the form (up to 30 bytes).

### Attention

To apply the changes in these items other than "Note" to the measurement results, it is necessary to execute [Measure All] or [Measure Changed].

## 5.11.6 [Step Measurement - Auto-detection (Java)] Option Settings

Set handwritten start/end identifier related information to identify handwritten parts during measurement of auto-generated Java source.

The range of lines including the identifies specified here is measured as handwritten and the measurement results are displayed as handwritten steps. The others are then measured as auto-generation and the measurement results are displayed as embedded steps.

For details on measurement criteria, refer to "[4.1.5 Auto-generated Java Source Measurement Criteria](#)".

## To Configure Settings

1. Select the [Step Measurement - Auto-detect Java] configuration command from the [Options] menu.
2. In the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#), set the necessary items.

Item	Description
[Display error for mismatched identifiers]	- To enable the display of errors for mismatched identifiers during measurement Click [Display error for mismatched identifiers] so that it is selected.
[Identifiers]	Registered handwritten start identifiers, handwritten end identifiers, and comments are displayed. <a href="#">Multiple selections</a> are possible. (Up to 100 pairs of identifiers can be specified.)
[Read]	To register the contents of an identifier file storing identifier information in the [Identifier] list, click the [Read] button. The [Browse Files] dialog box is displayed. At this time, the identifiers registered in the [Identifier] list are deleted.
[Write]	To save the registered identifiers displayed in the [Identifier] list as an identifier list file, click the [Write] button. The [Browse Files] dialog box is displayed.
[Add]	To add a new identifier to [Identifiers], click the [Add] button. The <a href="#">Specify Identifying String Dialog Box</a> is displayed.
[Delete]	Click the identifier to be deleted in [Identifiers] and click the [Delete] button. <a href="#">Multiple selections</a> are possible.

The following identifiers are pre-registered as standard.

Start Identifier	End Identifier	Comment
// >> 外部アジャスト対象の開始位置	// >> 外部アジャスト対象の終了位置	CBMBuilder

Start Identifier	End Identifier	Comment
//>>ユーザ領域開始	//ユーザ領域終了<<	User area protection tool
<!->>ユーザ領域開始	<!-ユーザ領域開始<<->	User area protection tool
//***** 変更可能領域 開始 *****	//***** 変更可能領域 終了 *****	User area protection tool

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All] or [Measure Changed].

## About Multiple Selections

### - To Specify Range

Click the first item of the target range, and while holding down the Shift key, click the last item. Alternatively, while holding down the Shift key, move on items using the up arrow and down arrow keys to specify the selection. When using only the mouse, surround the items to be selected by dragging the mouse to specify the range of selection.

### - To Specify Individually

Click items while holding down the Ctrl key. Alternatively, while holding down the Ctrl key, move on items with the up arrow and down arrow keys and specify items using the space key.

## 5.11.7 [Step Measurement - Auto-detection (VB 6.0)] Option Settings

Set start/end identifier related information to identify auto-generation sections during Visual Basic 6.0 source measurement.

The range of lines including the identifiers specified here is measured as auto-generation and the measurement results are displayed as embedded steps. The others are then measured as handwritten and the measurement results are displayed as handwritten steps. (This is the opposite to the Java auto-detection option, so caution is necessary.)

For details on measurement criteria, refer to "4.1.9 Visual Basic 6.0 Measurement Criteria".

## To Configure Settings

1. Select the [Step Measurement - Auto-detect VB 6.0] configuration command from the [Options] menu.
2. In the [Step Measurement - Auto-detection (VB 6.0)] Options Dialog Box, set the necessary items.

Item	Description
[Display error for mismatched identifiers]	- To enable the display of errors for mismatched identifiers during measurement Click [Display error for mismatched identifiers] so that it is selected.
[Identifiers]	Registered handwritten start identifiers, handwritten end identifiers, and comments are displayed. <b>Multiple selections</b> are possible. (Up to 100 pairs of identifiers can be specified.)
[Read]	To register the contents of an identifier file storing identifier information in the [Identifier] list, click the [Read] button. The [Browse Files] dialog box is displayed. At this time, the identifiers registered in the [Identifier] list are deleted.
[Write]	To save the registered identifiers displayed in the [Identifier] list as an identifier list file, click the [Write] button. The [Browse Files] dialog box is displayed.
[Add]	To add a new identifier to [Identifiers], click the [Add] button. The <b>Specify Identifying String Dialog Box</b> is displayed.
[Delete]	Click the identifier to be deleted in [Identifiers] and click the [Delete] button. <b>Multiple selections</b> are possible.

The following identifiers are pre-registered as standard.

Start Identifier	End Identifier	Comment
VERSION 5.00	Attribute VB_Exposed	VB 6.0(*.frm)
VERSION 1.0 CLASS	Attribute VB_Exposed	VB 6.0 (*.cls etc.)

### Attention

The identifiers pre-defined as standard for VB6.0 are not based on the published specifications from Microsoft. Therefore, edit or add identifiers if measurement is inaccurate.

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All] or [Measure Changed].

## 5.11.8 [Measure Variation - Measure] Option Settings

Configure the settings for the types of measurement results from variation measurement to be output and the measurement method.

### To Configure Settings

1. Select the [Measure Variation - Measure] configuration command from the [Options] menu.
2. In the [Measure Variation - Measure] Options Dialog Box, set the necessary items.

Item	Description
[Search in sub folders]	Specify whether to target files located in subfolders for measurement when specifying assets by folder specification.
[Valid lines only]	Specify whether to measure variations of valid lines only. To include comment lines in measurement, do not select this option.
[Measure blank lines]	Specify whether to measure blank lines. Blank lines are measured as comments if this is selected. Blank lines are not measured if this is not selected. (The blank line is a line of 0 bytes in length or a line consisting of only one-byte or two-byte blank spaces or tabs.)
[Measure lines with only "{" & "}" as comments]	Change the method for measuring lines with only "{" & "}". Lines with only "{" & "}" are measured as comments if selected. However, lines with "{" }" are considered to be valid lines. Lines with only "{" & "}" are measured as valid lines if not selected.
[Ignore multiple spaces between words]	Specify whether to consider blank lines or spaces between words that differ in number between old assets and new assets to be a match. Different spaces are considered to be matches if this is selected. (*1, *2)
[Distinguish between uppercase and lowercase letters]	Specify whether to distinguish between uppercase and lowercase letters in old assets and new assets. Measurement is case-sensitive if this is selected. Example: "int a;" <=> "int A;"
[Consider comment range]	Specify whether to consider lines that are not regarded as comments, such as C/C++ and Java /* ~ */ comments, but included in the comment range, as comments. These lines are considered to be comments if this is selected. (-> See "4.2 Variation Measurement Criteria".)

\*1: It is assumed that the Program (C language) was fixed as follows. (Hereafter, the blank is written by △.)

```
long△△I,j,max,ten_sv;
```

↓

```
long△I,j,max,ten_sv; ••"One digit blank" is deleted.
```

- To measure it disregarding a blank number of null line and word space, [Ignore multiple spaces between words] is selected. The measurement "Agreement" results when the correction measurement is executed by using the File before and after fix.
- Please do not select [Ignore multiple spaces between words] when you want to measure the blank of null line and the word space as it is. In that case, "One row corrected" measurement results because it detects a blank difference.

\*2: It is assumed that the Program (COBOL language) was Corrected as follows. (Hereafter, the blank is written by △.)

MOVE "△" TO DATA1.

↓

MOVE "△△" TO DATA1. ••One digit is given at the blank of the constant value in an effective row. (Change at the blank from 1 to 2 digits.)

- The modification of the number of the blank in the constant value enclosed within two single or double quotation mark is judged to be an effective modification as a program code. Therefore, when the variation measurement is performed by using the file before and after the modification, the measurement result will be "one line modification" regardless of the selection of [Ignore multiple spaces between words].

#### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All].

### 5.11.9 [Measure Variation - Display] Option Settings

---

Configure the settings for the types of measurement results from variation measurement to be output and the measurement method.

#### To Configure Settings

1. Select the [Measure Variation - Display] configuration command from the [Options] menu.
2. In the [\[Measure Variation - Display\] Options Dialog Box](#), set the necessary items.

Item	Description
[Display file information]	Specify whether to initially display the file type, update date, and file size.
[Display folder name]	Specify whether to initially display the folder name.

#### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All].

### 5.11.10 [Common - Extension] Option Settings

---

The extensions of assets to be measured can be changed.

- Up to 10 user-defined extensions can be added for each language type of each language category.
- One extension consists of 10 or less characters. Two-byte characters cannot be used.
- The same identifier can be specified more than once for different language categories, but not for different language types.
- Files of the specified extension is measured based on the comment standards of the specified language category and language type.
- The associated language type is shown in the type column of the measurement results and output to the measurement results dialog and a CSV file.

## To Configure Settings

1. Select the [Common - Extension] configuration command from the [Options] menu.
2. In the [\[Common - Extension\] Options Dialog Box](#), set the necessary items.

Item	Description
[Extension]	A list of language categories, language types, extensions, and comments is displayed.
[Read]	To read the contents of an extension file storing extension information into the [Extension] list, click the [Read] button. The [Browse Files] dialog box is displayed. At this time, the extensions contained in the [Extension] list are deleted.
[Write]	To save the registered extensions displayed in the [Extension] list as an extension list file, click the [Write] button. The [Browse Files] dialog box is displayed.
[Update]	To update [Extension] with new extensions, click the [Update] button. The <a href="#">Change Extensions Dialog Box</a> is displayed.
[Initialize]	To initialize added extension information, click the [Initialize] button. The extension list is set to <a href="#">Default Extensions</a> .

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All].

## 5.11.10.1 Default Extensions

The default extensions are as follow.

Language Category	Language Type	Extension
COBOL	COBOL	*.cbl;*.cob;*.cobol;*.scob;*.pco
C/C++	C/C++	*.c;*.cpp;*.h;*.rc
JAVA	JAVA	*.java
	SQLJ	*.sqlj
IDL	IDL	*.idl
Auto-generated JAVA	JAVA	*.java
	SQLJ	*.sqlj
HTML/JSP/JS/CSS	HTML	*.html;*.htm
	JSP	*.jsp;*.jspx;*.tag;*.tagx;*.tagf
	VB.NET	*.vb
	VBScript	*.vbs
	JavaScript	*.js
	StyleSheet	*.css
.NET (ASP/C#/VB)/HTML/JS/CSS	ASP.NET	*.asp;*.aspx;*.ascx;*.aspx
	C#	*.cs
	VB.NET	*.vb
	VBScript	*.vbs
	HTML	*.html;*.htm
	JScript	*.js
	StyleSheet	*.css

Visual Basic 6.0	VB 6.0	*.frm;*.bas;*.cls;*.ctl;*.pag;*.dsr
TEXT	TEXT	*.txt

### 5.11.11 [Common - Error Check] Option Settings

It sets about the behaviour when an error occurs during measurement processing.

#### To Configure Settings

1. Select the [Common - Error Check] configuration command from the [Options] menu.
2. In the [Common - Error Check] Options Dialog Box, set the necessary items.

Item	Description
[Continue measurement displaying messages]	Specify whether to continue measurement without displaying the error messages during measurement processing.

## 5.12 Command Line

This section explains various command line parameters and return values. Creating a shortcut or a batch file specifying a command makes it simple to repeat standard measurement periodically.

If only a command with no parameter settings is executed, the MF-STEP COUNTER dialog is displayed.

### 5.12.1 New Measurement

Specify various options for command line execution and perform new measurement.

#### Command

```
CMFSTP32.EXE [-TYPE STP/MOD] Target File/Folder -LANG Language Category [-FORCE] [-CHAR SJIS/UNICODE] [-CSV CSV File Name/Output Destination Folder Name] [-LOG Results Log File Name] [Options]
```

The parameters enclosed with [] are optional.

#### Parameters

The "-TYPE" switch specifies the measurement type. The default type is step measurement.

STP: Step Measurement

MOD: Variation Measurement

"Target File/Folder" specifies the measurement target file or folder. This cannot be omitted for new measurements.

When performing step measurement: Specify the measurement target file or folder.

When performing variation measurement: Specify the old folder and the new folder, separating them with a one-byte space.

The "-LANG" switch specifies the language category of the measurement target. This cannot be omitted for new measurements.

For the language category, specify any one of the following values.

Language Category	Measurement Criteria
ALL	<a href="#">4.1.1 Auto-detection Measurement Criteria</a>
COBOL	<a href="#">4.1.2 COBOL Measurement Criteria</a>
C	<a href="#">4.1.3 C/C++ Measurement Criteria</a>

Language Category	Measurement Criteria
JAVA	<a href="#">4.1.4 Java Measurement Criteria</a>
IDL	<a href="#">4.1.6 IDL Measurement Criteria</a>
JAVAAUTO	<a href="#">4.1.5 Auto-generated Java Source Measurement Criteria</a>
HTML	<a href="#">4.1.7 HTML/JSP/JS/CSS Measurement Criteria</a>
DOTNET	<a href="#">4.1.8 .NET (ASP/C#/VB)/HTML/JS/CSS Measurement Criteria</a>
VB	<a href="#">4.1.9 Visual Basic 6.0 Measurement Criteria</a>
TEXT	<a href="#">4.1.10 TEXT Measurement Criteria</a>

The "-FORCE" switch, if specified, lets measurement continue even if an error related to a target file (such as an open error or a code conversion error) occurs.

The "-CHAR" switch specifies the character code of the asset. The default code is Shift JIS.

SJIS: Shift JIS is used.

UNICODE: UNICODE is used.

The "-CSV" switch specifies the output destination for the measurement results CSV file. The default destination is the folder specified in the "TEMP" environment variable.

CSV File Name: The file with the specified file (\*.csv) name is output.

Output Destination Folder Name: The file named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.csv" is output to the specified folder.

The "-LOG" switch specifies the output destination for the measurement results log file. The default destination is the folder specified in the "TEMP" environment variable. The file named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.log" is output.

Results Log File Name: The file with the specified file (\*.log) name is output.

The switches shown in the following table can be specified as switches of "Options".

If no switch is specified, the default value shown in the following table is used.

Depending on the measurement type ("-TYPE" switch) setting, the available switches vary.

Switch	Parameter	Description	Default Value	TYPE Switch	
				STP	MOD
[Step Measurement - Measure] Options					
-PGM	ON: Output OFF: Do not output	Output of program step information	ON	Yes	-
-INC	ON: Output OFF: Do not output	Output of step information of embedded members	ON	Yes	-
-CPYCNT	ON: Measure OFF: Do not measure	Measure embedded members	OFF	Yes	-
-SQL	ON: Measure OFF: Do not measure	Measure embedded SQL	ON	Yes	-
-STPSUBFLD	ON: Search OFF: Do not search	Search in sub folders	ON	Yes	-

Switch	Parameter	Description	Default Value	TYPE Switch	
				STP	MOD
-STPBLK	ON: Measure OFF: Do not measure	Measure blank lines	ON	Yes	-
-COMMBLK	ON: Measure as comments OFF: Measure as blank lines	Measure blank lines as comments	OFF	Yes	-
-STPBRC	ON: Measure OFF: Do not measure	Measure lines with only "{" & "}" as comments	OFF	Yes	-
-H	ON: Measure OFF: Do not measure	Measure header files (*.h)	ON	Yes	-
-PGMID	ON: Measure OFF: Do not measure	Measure by program ID	ON	Yes	-
[Step Measurement - Display] Options					
-DSPFRM	FRM: Form LIST: List view	Display format	LIST	Yes	-
-LSTFILE	ON: Display OFF: Do not display	Display file information	ON	Yes	-
-LSTSQCNT	ON: Display OFF: Do not display	Display SQL steps	ON	Yes	-
-LSTSQRAT	ON: Display OFF: Do not display	Display SQL ratio	ON	Yes	-
-LSTCOMM NT	ON: Display OFF: Do not display	Display comments	ON	Yes	-
-LSTCOMM RAT	ON: Display OFF: Do not display	Display comment ratio	ON	Yes	-
-LSTINC	ON: Display OFF: Do not display	Display embedded information	ON	Yes	-
-LSTFLD	ON: Display OFF: Do not display	Display folder name	ON	Yes	-
[Step Measurement - Search Path] Options					
-PATHLST	PATH1*PATH2*.....PATH1 0	Search path (use "*" as a delimiter when specifying multiple paths)	None	Yes	-
[Step Measurement - CSV File] Options					
-NONDSPITEM	ON: Do not output OFF: Output	Do not output hidden items	ON	Yes	-
-TOTAVE	ON: Do not output OFF: Output	Do not output average, or total lines	OFF	Yes	-
[Step Measurement - Form] Options					
-PRTPATH	ON: Print OFF: Do not print	Print file path names	ON	Yes	-
[Step Measurement - Auto-detection (Java)] Options					
-JAVAFILE	File path	JAVA automatic identifier file	None	Yes	-
[Step Measurement - Auto-detection (VB 6.0)] Options					
-VBFILE	File path	VB 6.0 automatic identifier file	None	Yes	-

Switch	Parameter	Description	Default Value	TYPE Switch	
				STP	MOD
[Measure Variation - Measure] Options					
-MODSUBFLD	ON: Search OFF: Do not search	Search in sub folders	ON	-	Yes
-VALID	ON: Measure OFF: Do not measure	Valid lines only	ON	-	Yes
-MODBLK	ON: Measure OFF: Do not measure	Measure blank lines	OFF	-	Yes
-MULBLK	ON: Ignore OFF: Do not ignore	Ignore multiple spaces between words	OFF	-	Yes
-MODBRC	ON: Measure OFF: Do not measure	Measure lines with only "{" & "}" as comments	OFF	-	Yes
-UPPER	ON: Distinguish OFF: Do not distinguish	Distinguish between uppercase and lowercase letters	OFF	-	Yes
-COMM	ON: Considered OFF: Not considered	Consider comment range	OFF	-	Yes
[Measure Variation - Display] Options					
-FLDINFO	ON: Display OFF: Do not display	Display folders	ON	-	Yes
-FILEINFO	ON: Display OFF: Do not display	Display file information	ON	-	Yes
[Common - Extension] Options					
-EXTFILE	File path	Customized extension file	None	Yes	Yes

### Return Values

Possible return values of "CMFSTP32.EXE" after measurement results are output are as follow.

- 0: Normal end.
- 1: Normal end (but a measurement error occurred).
- 3: Output of the measurement results log failed.
- 4: Generation of the measurement results file (\*.csv) failed.
- 5: An error occurred in asset reading.
- 7: An error occurred in external file (\*.AJD) reading.
- 8: A double start error occurred.
- 9: A command line error occurred.

## 5.12.2 Remeasurement

It is possible to specify measurement results (the measurement results file [\*.STP]) in the MF-STEP COUNTER dialog to perform remeasurement under the same conditions.

### Command

```
CMFSTP32.EXE Measurement Results File (*.STP) [-FORCE] [-CSV CSV File Name/Output Destination Folder Name] [-LOG Results Log File Name] [Options]
```

The parameters enclosed with [] are optional.

## Parameters

For "Measurement Results File (\*.STP)", specify a measurement results file (\*.STP) that stores the results of step measurement or variation measurement in the MF-STEP COUNTER dialog. This cannot be omitted.

The measurement type, the language category, the assets, and the character code cannot be specified because those specified when the measurement results file (\*.STP) was saved are applied.

If the -CHAR option or the -LANG option is specified, a command error occurs.

The "-FORCE" switch, if specified, lets measurement continue even if an error related to a target file (such as an open error or a code conversion error) occurs.

The "-CSV" switch specifies the output destination for the measurement results CSV file. The default destination is the folder specified in the "TEMP" environment variable.

CSV File Name: The file with the specified file name is output.

Output Destination Folder Name: The file named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.csv" is output to the specified folder.

The "-LOG" switch specifies the output destination for the measurement results log file. The default destination is the folder specified in the "TEMP" environment variable. The file named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.log" is output.

Results Log File Name: The file with the specified file name is output.

## About Switches of "Options"

The switches of each option are similar to those for new measurement, with the following exceptions.

If the measurement option, the search path option, or the variation measurement option is omitted, the option specified when the measurement results file (\*.STP) was saved is applied. To change options, create the measurement results file (\*.STP) again.

## Return Values

Possible return values of "CMFSTP32.EXE" after measurement results are output are as follow.

- 0: Normal end.
- 1: Normal end (but a measurement error occurred).
- 3: Output of the measurement results log failed.
- 4: Generation of the measurement results file (\*.csv) failed.
- 5: An error occurred in asset reading.
- 6: An error occurred in results file (\*.stp) reading.
- 7: An error occurred in external file (\*.AJD) reading.
- 8: A double start error occurred.
- 9: A command line error occurred.

## 5.12.3 Usage Example

---

In the following example, the installation destination is assumed to be "c:\Program Files\SIMPLIA\MF-STEP COUNTER".

### When specifying only CMFSTP32.EXE

Only this tool is started. For details on the subsequent operations, refer to [New Measurement](#) or [5.4 Reading Measurement Results Files](#).

### Description of Parameters

FORCE

=> Continues measurement even if a measurement error occurs in the measurement target file.

### Usage Example

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe"
```

It starts SIMPLIA MF-STEP-COUNTER.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" -force
```

It starts SIMPLIA MF-STEP-COUNTER. It also continues measurement even if a measurement error occurs in the measurement target file.

## When specifying a measurement target file as a new measurement (step measurement) argument

This newly measures the measurement target file based on the measurement criteria of the specified language category and outputs the measurement results.

However, only a single file can be specified as the target file. In addition, wildcard specification (file specification using \* or ?) is not supported. To measure multiple files, specify the folder as below.

### Description of Parameters

LANG Language Category

=> Performs new measurement based on the measurement criteria of the specified language category. If this is not specified, a parameter error occurs.

CHAR Character Code

=> Specifies the character code used for measurement.

CSV CSV File Name (\*.CSV)

=> Saves the measurement results as a CSV file and ends the processing.

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

CSV Output Destination Folder Name

=> Outputs the measurement results to the output destination folder and ends the processing. The output CSV file is named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.csv".

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

### Usage Example

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work\test.c -lang c -char sjis -force
```

This newly measures the measurement target file test.c using the Shift-JIS character code, based on the measurement criteria of the C/C++ language category, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv in the folder specified in the "TEMP" environment variable, and ends the processing. It also continues measurement even if a measurement error occurs in the measurement target file.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work\test.c -lang c -csv d:\work\csv\test.csv
```

This newly measures the measurement target file test.c based on the measurement criteria of the C/C++ language category, outputs the measurement results to test.csv, and ends the processing.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work\test.c -lang c -csv d:\work\csv
```

This newly measures the measurement target file test.c based on the measurement criteria of the C/C++ language category, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv, and ends the processing.

## When specifying a measurement target folder as a new measurement (step measurement) argument

This newly measures source files in the measurement target folder based on the measurement criteria of the specified language category and outputs the measurement results.

Measurement target source files are those with the specified [extensions associated with the language category](#).

### Description of Parameters

FORCE

=> Continues measurement even if a measurement error occurs in the measurement target file.

LANG Language Category

=> Performs new measurement based on the measurement criteria of the specified language category. If this is not specified, a parameter error occurs.

CHAR Character Code

=> Specifies the character code used for measurement.

CSV CSV File Name (\*.CSV)

=> Saves the measurement results as a CSV file.

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

CSV Output Destination Folder Name

=> Outputs the measurement results to the output destination folder. The output CSV file is named named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.csv".

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

Usage Example

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work -lang c -char unicode -force
```

This newly measures measurement target files in the measurement target folder work using the UNICODE character code, based on the measurement criteria of the C/C++ language category, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv in the folder specified in the "TEMP" environment variable, and ends the processing. It also continues measurement even if a measurement error occurs in the measurement target file.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work -lang c -csv d:\work\csv\test.csv
```

This newly measures measurement target files in the measurement target folder work based on the measurement criteria of the C/C++ language category, outputs the measurement results to test.csv, and ends the processing.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP-COUNTER\CMFSTP32.exe" d:\work -lang c -csv d:\work\csv
```

This newly measures measurement target files in the measurement target folder work based on the measurement criteria of the C/C++ language category, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv, and ends the processing.

## When specifying a measurement results file as a remeasurement (step measurement) argument

This reads and measures a specified measurement results file (\*.STP) and saves the measurement results as a CSV file.

### Description of Parameters

FORCE

=> Continues measurement even if a measurement error occurs in the measurement target file.

CSV CSV File Name (\*.CSV)

=> Saves the measurement results as a CSV file.

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

### CSV Output Destination Folder Name

=> Outputs the measurement results to the output destination folder. The output CSV file is named along with date and time as "mfstp32\_MMDDYYYYHHMMSS.csv".

If a file with the same name exists at the CSV file output destination, the file is overwritten. After measurement, a CSV file is output and the process is closed.

### Usage Example

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP COUNTER\CMFSTP32.exe" d:\work\test.stp -force
```

This remeasures the measurement results file test.stp, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv in the folder specified in the "TEMP" environment variable, and ends the processing. Measurement is continued even if an error occurs in the measurement target file.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP COUNTER\CMFSTP32.exe" d:\work\test.stp -csv d:\work\csv\test.csv
```

This remeasures the measurement results file test.stp, outputs the measurement results to test.csv, and ends the processing.

```
c:\>"c:\Program Files\SIMPLIA\MF-STEP COUNTER\CMFSTP32.exe" d:\work\test.stp -csv d:\work\csv
```

This remeasures the measurement results file test.stp, outputs the measurement results to mfstp32\_MMDDYYYYHHMMSS.csv, and ends the processing.

### Attention

For the measurement results file, the measurement target file/folder, and the CSV file/folder, specify the full path. Do specify only the file name or a relative path.

To specify a measurement results file from an older version, save the file once in the Main dialog. Measurement results files saved using an older version cannot be remeasured.

If the file name or folder name contains spaces, enclose the path in "".

Example: cmfstp32.exe "d:\work folder\test.stp"

To execute the command from the command prompt, specify the installation folder of this product in the PATH environment variable in advance to simplify startup from the exe file name.

# Chapter 6 User Interface

This chapter explains the user interface of MF-STEP COUNTER.

## 6.1 Menus

This section explains the various menus.

### 6.1.1 [File] Menu

Menu Command	Function
<a href="#">New Measurement</a>	Performs new measurement and displays the measurement results on screen.
<a href="#">Read</a>	Reads an existing measurement results file and displays the measurement results on screen.
<a href="#">Edit Assets List</a>	Allows editing of a specified assets list by adding/deleting assets.
<a href="#">Save</a>	Saves the measurement results to the file.
<a href="#">Save As</a>	Saves the measurement results as a new file with the specified name.
<a href="#">Save Selected Range As CSV File</a>	Saves only the selected target file rows in the list view of the measurement results as a CSV file. (Enabled only in the List view mode. For details on how to change the display format, refer to <a href="#">5.11.2 [Step Measurement - Display] Option Settings.</a> )
<a href="#">Save As CSV File</a>	Saves the measurement results as a CSV file. <a href="#">5.8.1 Form CSV File</a> <a href="#">5.8.2 List View CSV File</a>
<a href="#">Print</a>	Sets printing related information and outputs the measurement results to the printer. (Enabled only if the measurement results display format is Form. For details on how to change the display format, refer to <a href="#">5.11.2 [Step Measurement - Display] Option Settings.</a> )
<a href="#">Recently Used Files</a>	Displays up to five previously handled measurement results files, in order from the latest. The measurement results file selected here is read and the measurement results are displayed on screen.

Related items

[6.2 Toolbars](#)

[6.3 Shortcut Keys](#)

### 6.1.2 [Measure] Menu

Menu Command	Function
<a href="#">Measure All</a>	Remeasures measurement target files specified for all measurement and displays the measurement results on screen. To apply changes in options to the measurement results, it is necessary to execute this command.
<a href="#">Measure Changed</a>	Measures only files added in the process of [Edit Assets List] and displays the measurement results.  When assets were deleted in the process of [Edit Assets List], this command cannot be used. Use Measure All instead.

Related items

[6.2 Toolbars](#)

[6.3 Shortcut Keys](#)

### 6.1.3 [Display] Menu

Menu Command	Function
Toolbars	Controls the display of the Main, Display Control, and Display Folder toolbars.
Status Bar	Displays or hides the status bar.
File Information	Displays or hides the type, size, and update date of file information. (*1)
SQL Steps	Displays or hides SQL and ETC of SQL information. (*1)
SQL Ratio	Displays or hides the SQL ratio of SQL information. (*1)
Comment Steps	Displays or hides comments, Javadoc, and ETC. (*1)
Comment Ratio	Displays or hides the comment ratio and the Javadoc ratio. (*1)
Embedded Type	Displays or hides items by embedded type for program information, and embedded information for embedded member information. (*1)
Folder Name	Displays or hides the folder name. (*1)
Initialize Display	Returns the display of each column to the state specified in the display options. (*1)
Previous Page	Changes the display page in the current active document window to the previous page. (*2)
Next Page	Changes the display page in the current active document window to the next page. (*2)
First Page	Displays the first page in the current active document window. (*2)
Last Page	Displays the last page in the current active document window. (*2)
<a href="#">Specify Page</a>	Displays the specified page in the current active document window. (*2)

\*1: Enabled only if the measurement results display format is List view.

\*2: Enabled only if the measurement results display format is Form.

Related items

[6.2 Toolbars](#)

[6.3 Shortcut Keys](#)

### 6.1.4 [Options] Menu

Menu Command	Function
<a href="#">[Step Measurement - Measure] Options</a>	Allows setting of the type and information of step measurement.
<a href="#">[Step Measurement - Display] Options</a>	Allows specification of information related to the dialog display format and the list view dialog.
<a href="#">[Step Measurement - Search Path] Options</a>	Allows setting of the paths to folders in which embedded files expanded in the source program are located.
<a href="#">[Step Measurement - CSV File] Options</a>	Allows setting of CSV file output related information.
<a href="#">[Step Measurement - Form] Options</a>	Allows specification of form dialog and form printing related information.
<a href="#">[Step Measurement - Auto-detection (Java)] Options</a>	Allows specification of handwritten/auto-generation measurement related information for auto-generated Java source measurement.
<a href="#">[Step Measurement - Auto-detection (VB 6.0)] Options</a>	Allows specification of handwritten/auto-generation measurement related information for Visual Basic 6.0 source measurement.
<a href="#">[Measure Variation - Measure] Options</a>	Allows setting of the type and information of variation measurement.

Menu Command	Function
<a href="#">[Measure Variation - Display] Options</a>	Allows setting of the initial display of variation measurement.
<a href="#">[Common - Extension] Options</a>	Allows setting of the extensions of assets of which steps or variations are measured.
<a href="#">[Common - Error Check] Options</a>	Set the behaviour when an error occurs during the measurement process when measuring steps or variations.

## 6.1.5 [Windows] Menu

---

Use this menu when multiple windows are displayed, such as in cases where the embedded member step information window is displayed separately from the program step information window in order to display the measurement results in a certain language such as COBOL and C/C++.

Menu Command	Function
Display Overlapping	Cascades open windows in a manner that all the title bars are visible.
Align Vertically	Tiles open windows vertically in a manner that all the windows are visible.
Align Horizontally	Tiles open windows horizontally in a manner that all the windows are visible.

### **Ohters**

The title bar strings of currently displayed document windows are added as submenu items. Select an added submenu item to activate the corresponding document window.

### Display Folder Toolbar

If measurement of target assets including subfolders is performed, the "Display Folder" toolbar provides a list of the subfolders and "All" which indicates all of the measurement target files. Select one of these to view the measurement results by folder or view all of the measurement results.

In the case of variation measurement, folders of the new version are used as the base.

(Enabled only in List view mode)

## 6.4 Dialog Boxes

This section explains the various dialog boxes.

### 6.4.1 New Measurement 1/2 Dialog Box

Specify the language category and the target resource specification method.

Item	Description
[Measurement Type]	Select [Steps] or [Variations].

Item	Description
[Language Category]	<p>Select the language of the target asset from the drop-down list box.</p> <p>In the case of step measurement, [Auto-detection], [COBOL], [C/C++], [Java], [IDL], [Auto-generated Java Source], [HTML/JSP/JS/CSS], [.NET (ASP/C#/VB)/HTML/JS/CSS], [Visual Basic 6.0], and [TEXT] are selectable.</p> <p>In the case of variation measurement, [Auto-detection], [COBOL], [C/C++], [Java], [.NET (ASP/C#/VB)/HTML/JS/CSS], and [TEXT] are selectable.</p> <p>If [Auto-detection] is selected, target files are measured according to <a href="#">Auto-detection Measurement Criteria</a>.</p>
[Target Asset Specification Method]	<p>Select [File] to select measurement target assets using file as the unit.</p> <p>Select [Folder] to select measurement target assets using folder as the unit. To specify whether to search in subfolders, configure the setting in <a href="#">[Step Measurement - Measure] Options</a> or <a href="#">[Measure Variation - Measure] Options</a>.</p>
[Character Code]	<p>Select [Shift JIS] or [UNICODE] as the character code of the measurement target asset.</p> <p>[UNICODE] is compatible with UTF-8 or UCS2 (Big Endian or Little Endian) with BOM (Byte Order Mark).</p>

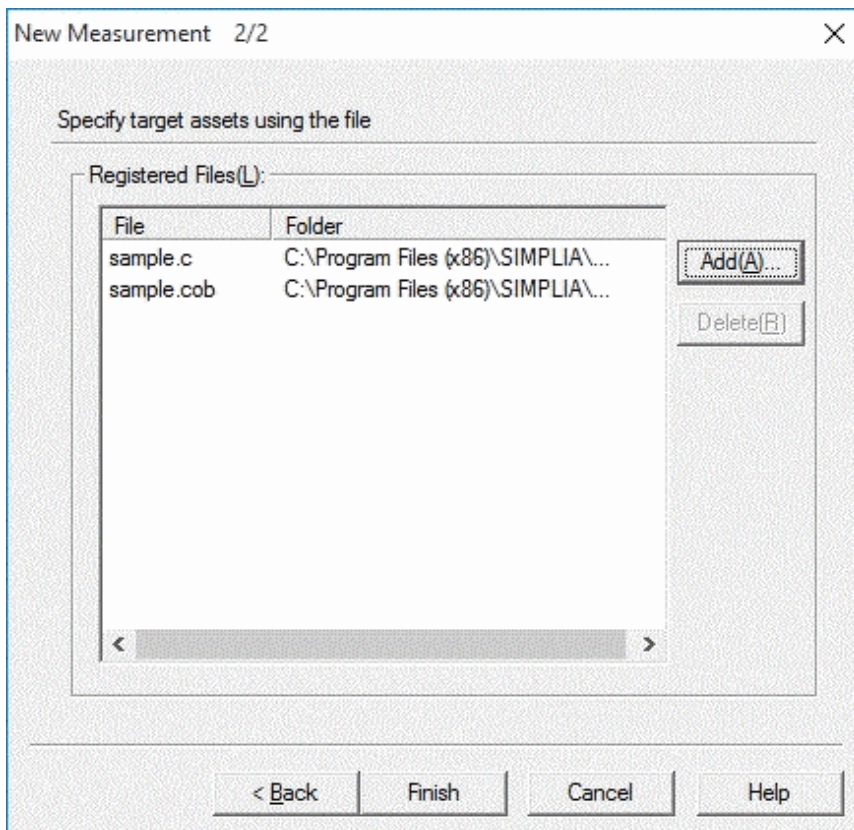

=> [6.4.2 New Measurement 2/2 Dialog Box \(Step Measurement\)](#)

=> [6.4.3 New Measurement 2/2 Dialog Box \(Variation Measurement\)](#)

## 6.4.2 New Measurement 2/2 Dialog Box (Step Measurement)

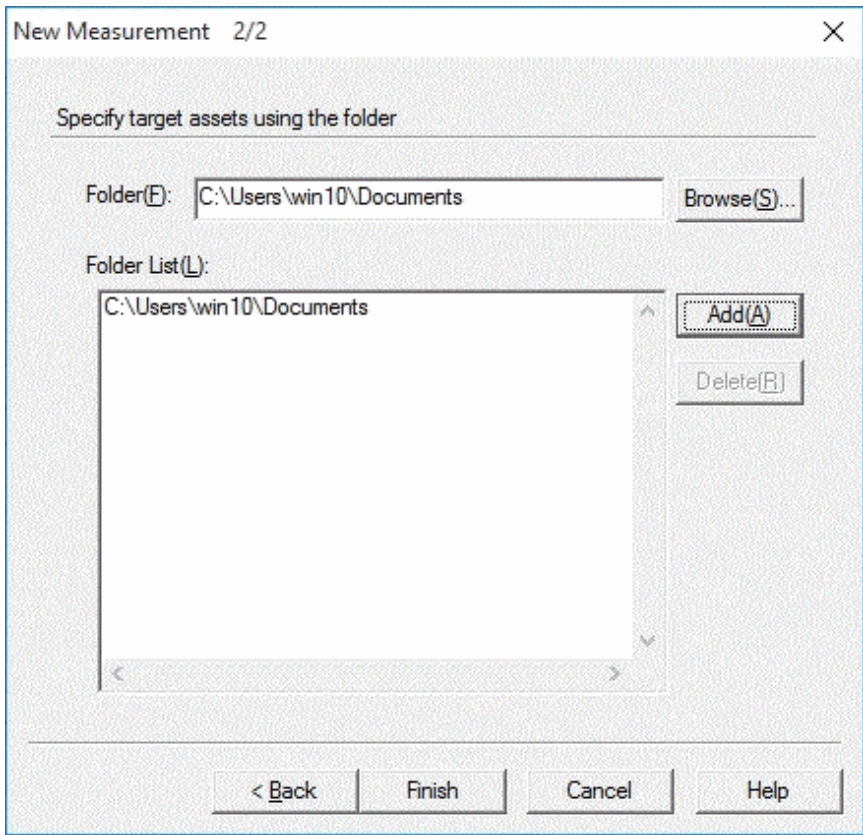

Specify measurement target assets. Depending on the [Target Asset Specification Method] selected in the [New Measurement 1/2] dialog box, the [Specify target assets using the file] dialog or the [Specify target assets using the folder] dialog is displayed.

### For [Specify target assets using the file]

Item	Description
[Registered Files]	A list of registered file names (file names and folder names) is displayed. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Add]	Click the [Add] button, and the [Specify File] dialog box is displayed. In this dialog box, specify a file and click the [Open] button to add the file name to [Registered Files]. <a href="#">Multiple selections</a> are also possible.  Selectable files are those with the extensions specified for each language type using the extension option.
[Delete]	Click the file name to be deleted from [Registered Files] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

**For [Specify target assets using the folder]**

Item	Description
[Folder]	The name of the folder set to be referenced from the [Browse] button is displayed. Direct manual entry is also available.
[Folder List]	A list of registered folder names is displayed. Double-click a folder name, and the selected folder name is displayed in the [Folder] edit box. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Browse]	To browse folder names, click the [Browse] button. The [Browse for Folder] dialog box is displayed.
[Add]	With the [Folder] edit box displaying the folder name, click the [Add] button.  When [Search in sub folders] is enabled as a measurement option  In cases where a higher level folder has been registered, a lower level folder cannot be registered.

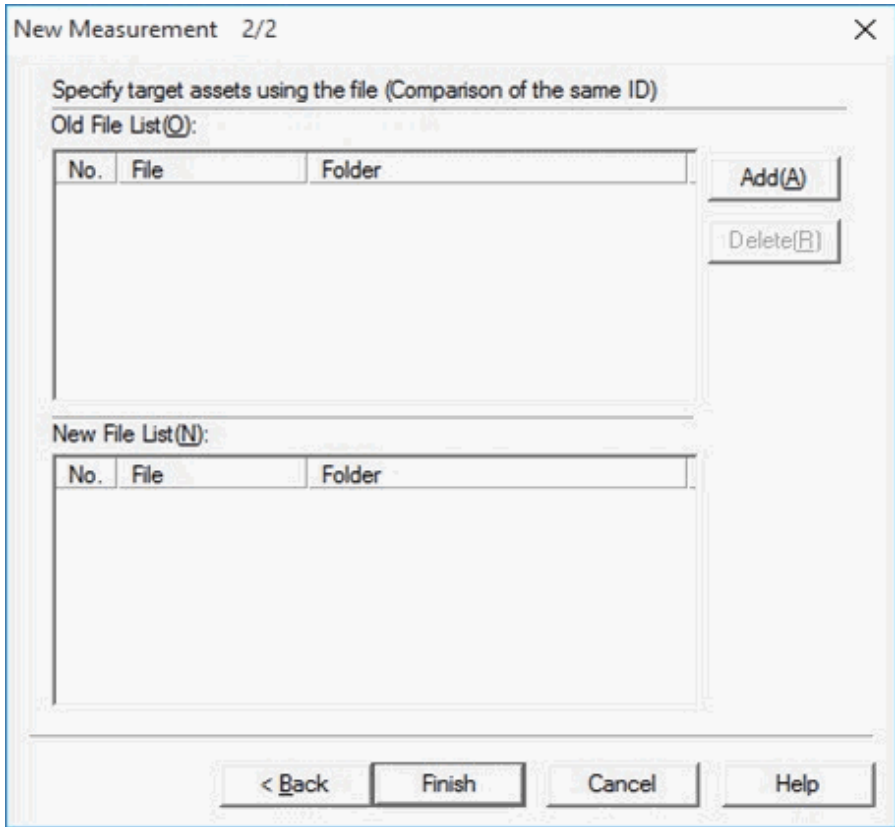

Item	Description
	In cases where a lower level folder has (or lower folders have) been registered, a higher level folder cannot be registered.
[Delete]	Click the folder name to be deleted from [Folder List] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

### 6.4.3 New Measurement 2/2 Dialog Box (Variation Measurement)

Specify measurement target assets. Depending on the [Target Asset Specification Method] selected in the [New Measurement 1/2] dialog box, the [Specify target assets using the file] dialog or the [Specify target assets using the folder] dialog is displayed.

Old and new files with different names can be compared if the [File] specification method is selected, but only files with the same name are compared if the [Folder] specification method is selected. To include subfolders in the measurement, the subfolders must also have the same name.

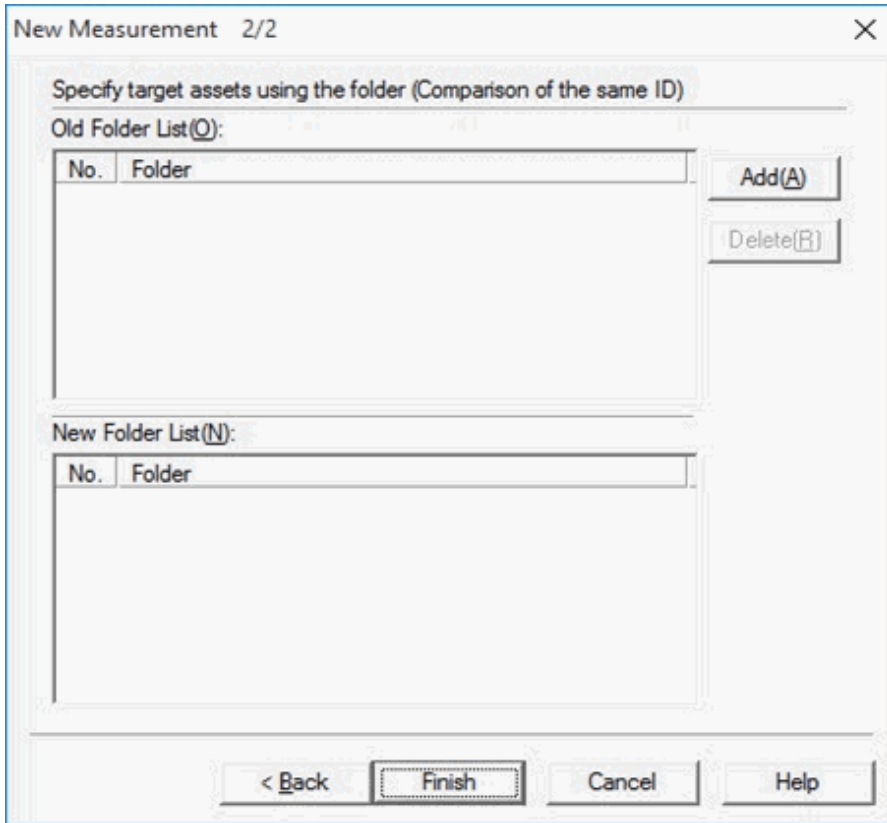

#### For [Specify target assets using the file]

Item	Description
[Old File List]	A list of registered file names (file names and folder names) is displayed. Files are compared with the files with the same number in the new file list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[New File List]	A list of registered file names (file names and folder names) is displayed. Files are compared with the files with the same number in the old file list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Add]	Click the [Add] button, and the [Specify File] dialog box is displayed. In the dialog box, specify a file and click the [Open] button to add the file name to the [File List].

Item	Description
	The files that can be selected are those with the extensions specified for each language type (COBOL, JAVA, C/C++, .NET, or TEXT) using the extension option.
[Delete]	Click the file name to be deleted from [Registered Files] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

**For [Specify target assets using the folder]**

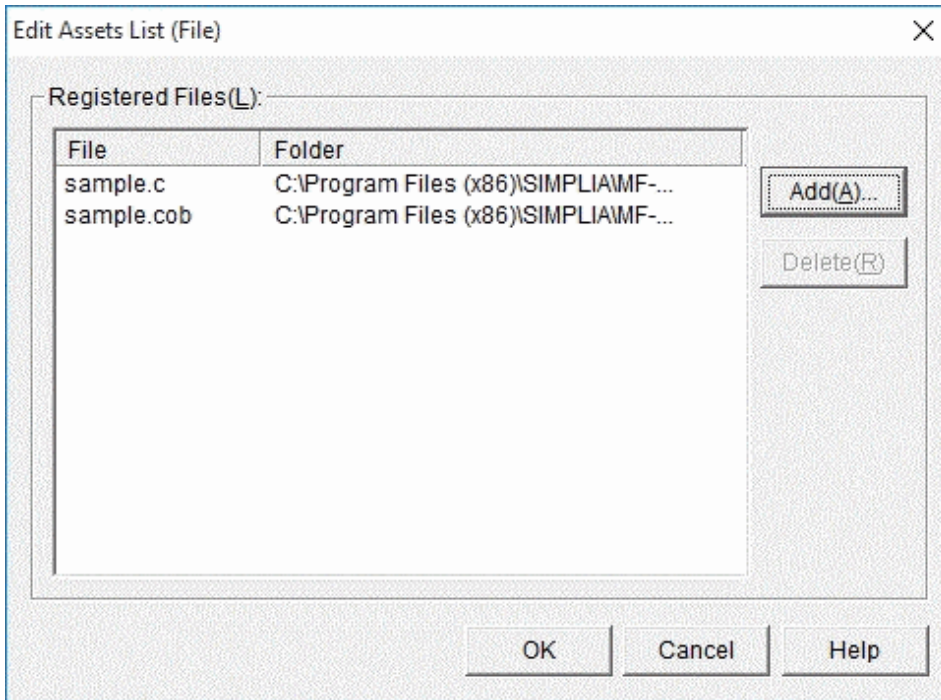

Item	Description
[Old Folder List]	A list of registered folder names is displayed. Folders are compared with the folders with the same number in the new folder list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[New Folder List]	A list of registered folder names is displayed. Folders are compared with the folders with the same number in the old folder list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Add]	Click the [Add] button, and the [Browse for Folder] dialog box is displayed. In the dialog box, specify a folder to add the folder to the [Folder List].  When [Search in sub folders] is enabled as a measurement option  In cases where a higher level folder has been registered, a lower level folder cannot be registered.  In cases where a lower level folder has (or lower folders have) been registered, a higher level folder cannot be registered.
[Delete]	Click the folder name to be deleted from [Folder List] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

## 6.4.4 Edit Assets List Dialog Box (Step Measurement)

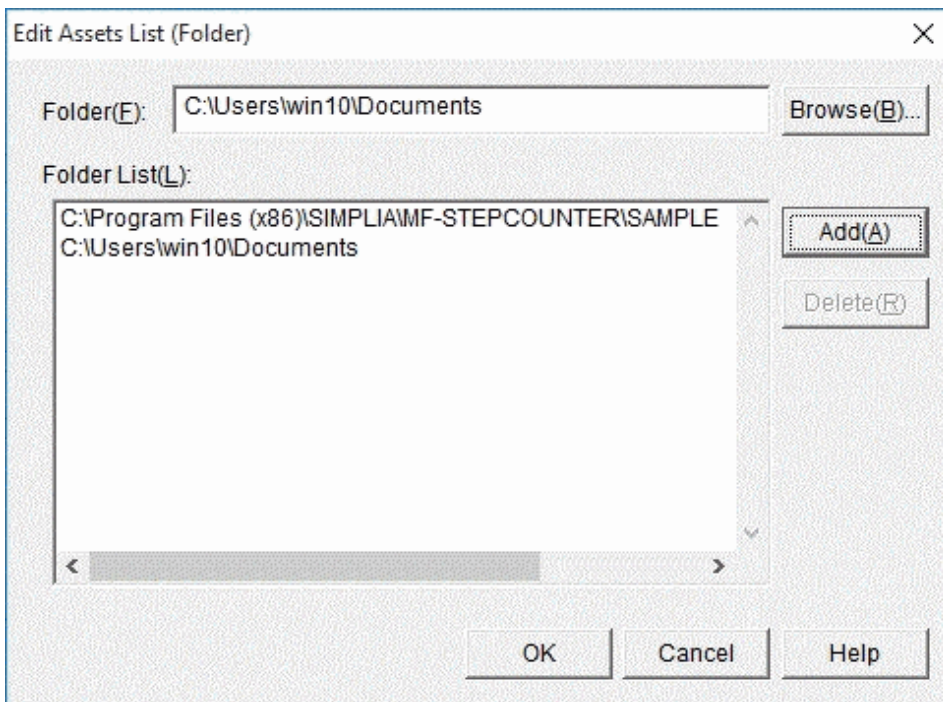

Edit the assets list specified for new measurement or the assets list updated after the reading of a measurement results file, by adding/deleting assets. The [Edit Assets List (File)] dialog is displayed if the file specification method was selected for new measurement, or the [Edit Assets List (Folder)] dialog is displayed if the folder specification method was selected.

For [Specify target assets using the file]

Item	Description
[Registered Files]	A list of registered file names (file names and folder names) is displayed. <a href="#">Multiple selections</a> are possible.
[Add]	Click the [Add] button, and the [Specify File] dialog box is displayed. In this dialog box, specify a file and click the [Open] button to add the file name to [Registered Files]. <a href="#">Multiple selections</a> are also possible.  Selectable files are those with the extensions specified for each language type using the extension option.
[Delete]	Click the file name to be deleted from [Registered Files] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

**For [Specify target assets using the folder]**

Item	Description
[Folder]	The name of the folder set to be referenced from the [Browse] button is displayed. Direct manual entry is also available.
[Folder List]	A list of registered folder names is displayed. Double-click a folder name, and the selected folder name is displayed in the [Folder] edit box. <a href="#">Multiple selections</a> are possible.
[Browse]	To browse folder names, click the [Browse] button. The [Browse for Folder] dialog box is displayed.
[Add]	With the [Folder] edit box displaying the folder name, click the [Add] button. When [Search in sub folders] is enabled as a measurement option In cases where a higher level folder has been registered, a lower level folder cannot be registered. In cases where a lower level folder has (or lower folders have) been registered, a higher level folder cannot be registered.
[Delete]	Click the folder name to be deleted from [Folder List] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

**Attention**

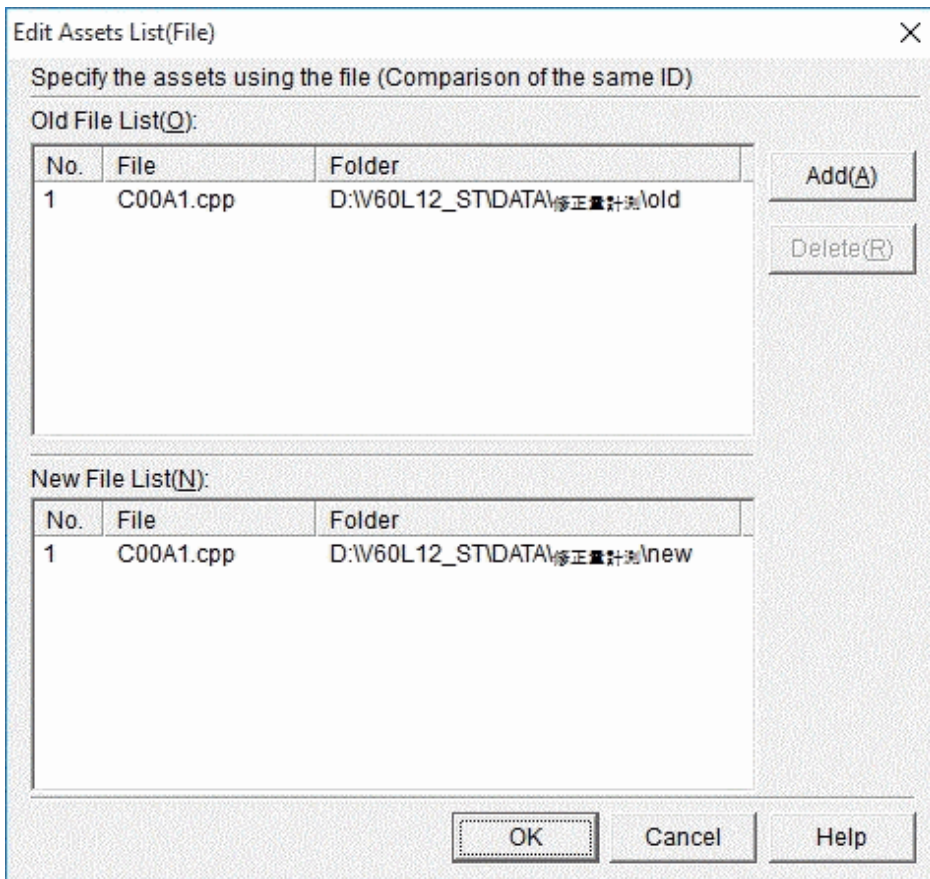

If the OK button is clicked after editing the assets list, the measurement results that have been displayed on screen are discarded unconditionally, even if they are unsaved.

### 6.4.5 Edit Assets List Dialog Box (Variation Measurement)

Edit the assets list specified for new measurement, or edit the assets list after the reading of a measurement results file, by adding/deleting assets. Depending on the target asset specification method selected for new measurement, the [Edit Assets List (File)] dialog or the [Edit Assets List (Folder)] dialog is displayed.

Old and new files with different names can be compared if the [File] specification method is selected, but only files with the same name are compared if the [Folder] specification method is selected. To include subfolders in the measurement, the subfolders must also have the same name.

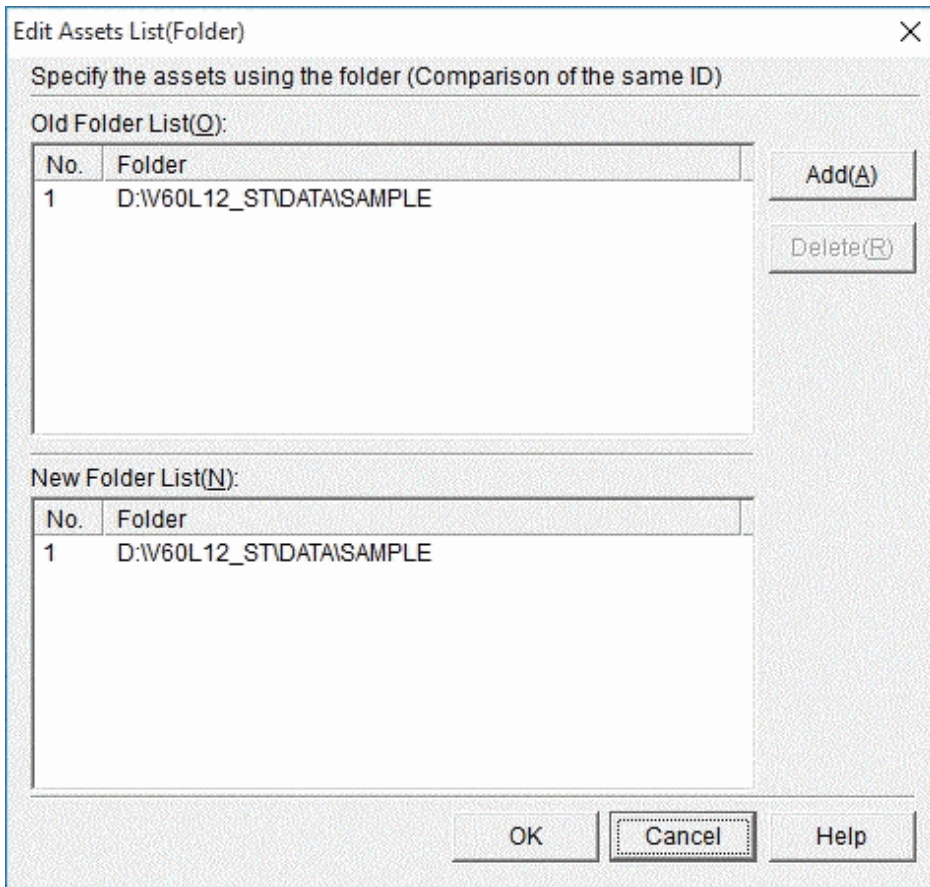

**For [Specify target assets using the file]**

Item	Description
[Old File List]	A list of registered file names (file names and folder names) is displayed. Files are compared with the files with the same number in the new file list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[New File List]	A list of registered file names (file names and folder names) is displayed. Files are compared with the files with the same number in the old file list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Add]	Click the [Add] button, and the [Specify File] dialog box is displayed. In the dialog box, specify a file and click the [Open] button to add the file name to the [File List].  Selectable files are those of the extensions specified for each language type (COBOL, JAVA, C/C++, .NET, or TEXT) using the extension option.
[Delete]	Click the file name to be deleted from the [Old File List] or the [New File List] and click the [Delete] button. Selected files will be deleted from both lists. <a href="#">Multiple selections</a> are also possible.

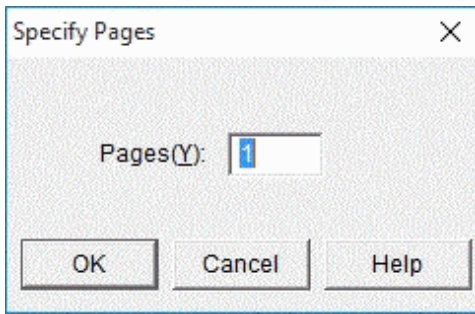

**For [Specify target assets using the folder]**

Item	Description
[Old Folder List]	A list of registered folder names is displayed. Folders are compared with the folders with the same number in the new folder list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[New Folder List]	A list of registered folder names is displayed. Folders are compared with the folders with the same number in the old folder list. <a href="#">Multiple selections</a> are possible. (Used for deletion)
[Add]	Click the [Add] button, and the [Browse for Folder] dialog box is displayed. In the dialog box, specify a folder to add the folder to the [Folder List].  When [Search in sub folders] is enabled as a measurement option  In cases where a higher level folder has been registered, a lower level folder cannot be registered.  In cases where a lower level folder has (or lower folders have) been registered, a higher level folder cannot be registered.
[Delete]	Click the folder name to be deleted from [Folder List] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

## 6.4.6 Specify Pages Dialog Box

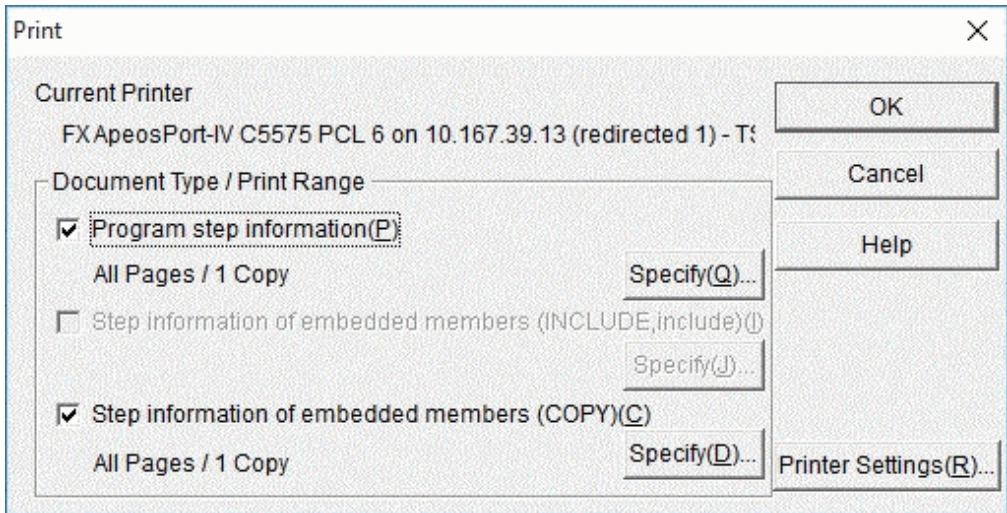

Specify the pages to display in the measurement results dialog in form mode.

Item	Description
[Pages]	Set the pages to be displayed in the [Pages] edit box.

## 6.4.7 Print Dialog Box

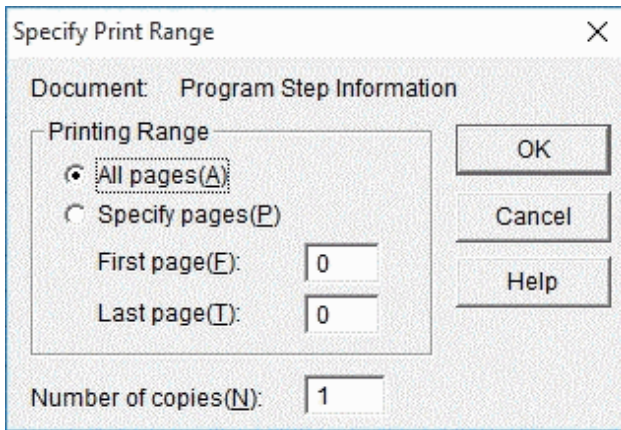

Set printing related information.

Item	Description
[Current Printer]	Displays the currently selected printer.
[Document Type / Print Range]	<p>Displays the selected document type for printing and the print range of each document.</p> <ul style="list-style-type: none"> <li>- To print documents</li> </ul> <p>Click the document type of the documents to be printed so that it is selected.</p> <ul style="list-style-type: none"> <li>- To change the printing range</li> </ul> <p>Click the [Specify] button of each document. The <a href="#">Specify Print Range Dialog Box</a> is displayed.</p> <ul style="list-style-type: none"> <li>- To change the number of copies</li> </ul> <p>Click the [Specify] button of each document. The <a href="#">Specify Print Range Dialog Box</a> is displayed.</p>
[Printer Settings]	Change the printer and configure printer settings.

## 6.4.8 Specify Print Range Dialog Box

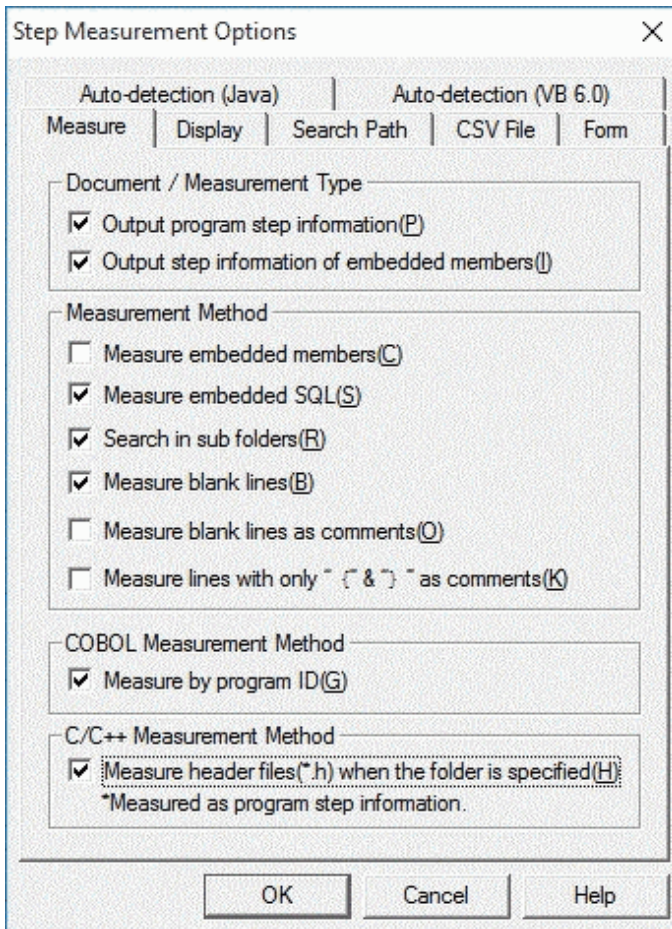

Set the range of pages to print and the number of copies.

Item	Description
[Document]	The target document is displayed.
[Printing Range]	Select [All pages] or [Specify pages]. When [Specify Page] is selected, enter values in the [First page] and [Last page] edit boxes. If "0" is specified for both, all pages are printed. If "0" is specified for [Last page], the pages up to the last page are printed. When specifying a page number other than "0" for [Last page], specify a page number other than "0" for [First page].
[Number of copies]	Set the number of copies to print in the [Number of copies] edit box.

### 6.4.9 [Step Measurement - Measure] Options Dialog Box

Using measurement options, configure the settings for the types of measurement results to be output and the measurement method to be used.

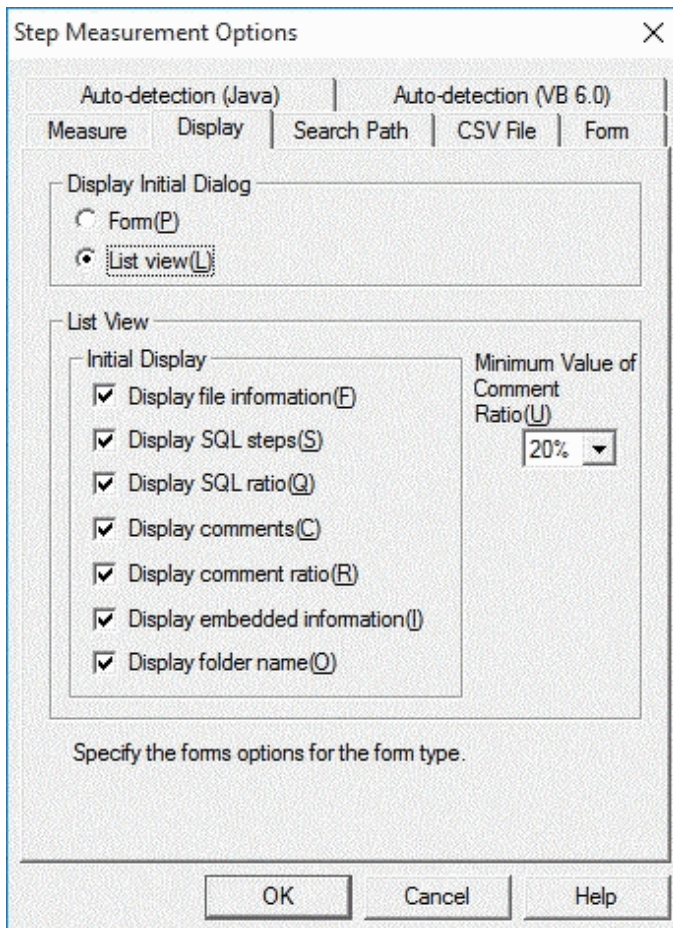

Item	Description
[Document / Measurement Type]	<p>Selection of at least one is necessary.</p> <ul style="list-style-type: none"> <li>- To output program step information Click [Output program step information] so that it is selected.</li> <li>- To output step information of embedded members Click [Output step information of embedded members] so that it is selected.</li> </ul> <p><b>Attention</b></p> <p>If only [Output step information of embedded members] is selected and if sources such as html or java sources containing no embedded member step information are measured, program step information is output even if [Output program step information] is not selected.</p>
[Measurement Method]	<ul style="list-style-type: none"> <li>- To measure embedded members Click [Measure embedded members] so that it is selected.</li> <li>- To measure embedded SQL Click [Measure embedded SQL] so that it is selected.</li> <li>- To search in sub folders Click [Search in sub folders] so that it is selected.</li> <li>- To measure blank lines Click [Measure blank lines] so that it is selected.</li> </ul>

Item	Description
	<ul style="list-style-type: none"> <li>- To measure blank lines as comments Click [Measure blank lines as comments] so that it is selected.</li> <li>- To measure lines with only "{" &amp; "}" as comments Click [Measure lines with only "{" &amp; "}" as comments] so that it is selected.</li> </ul>
[COBOL Measurement Method]	<ul style="list-style-type: none"> <li>- To perform measurement by program ID when the language category is COBOL Click [Measure by program ID] so that it is selected.</li> </ul>
[C/C++ Measurement Method]	<ul style="list-style-type: none"> <li>- To measure header files as program step information when the language category is C/C++ Click [Measure header files (*.h) when the folder is specified] so that it is selected.</li> </ul> <p><b>Attention</b></p> <p>If [Measure embedded members] is selected, [Measure header files (*.h) when the folder is specified] is automatically unchecked and disabled.</p>

## 6.4.10 [Step Measurement - Display] Options Dialog Box

Allows specification of information related to the dialog display format and the list view dialog.

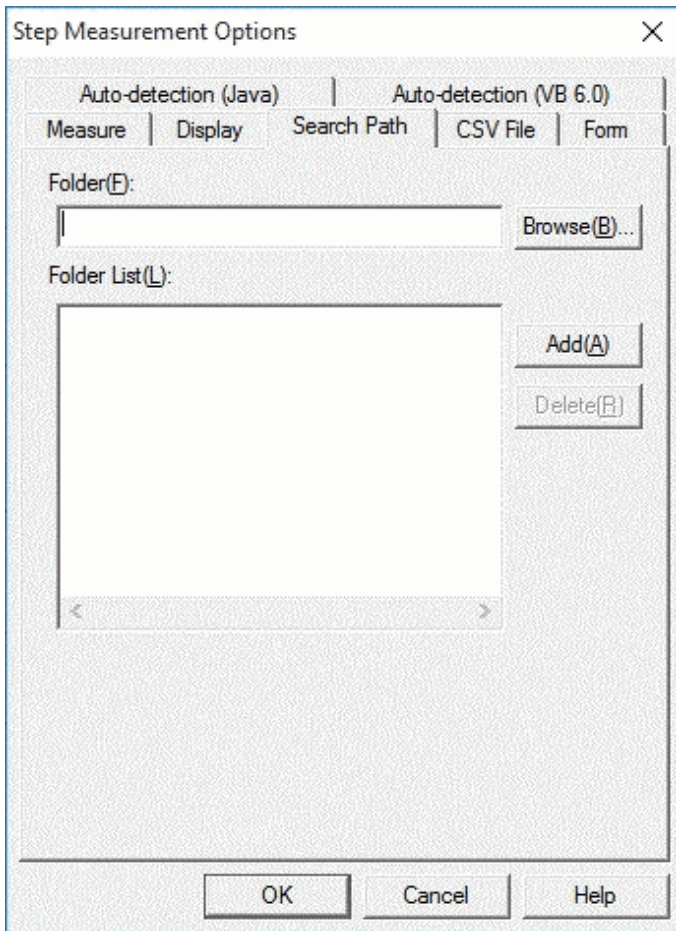

Item	Description
[Display Initial Dialog]	<ul style="list-style-type: none"> <li>- To output the measurement results in form mode Click [Form] so that it is selected.</li> </ul>

Item	Description
	<ul style="list-style-type: none"> <li>- To output the measurement results in list view mode Click [List view] so that it is selected.</li> </ul>
[List view]	<ul style="list-style-type: none"> <li>- When [List view] of [Display Initial Dialog] is selected, specify the following.</li> <li>- To display file information Click [Display file information] so that it is selected.</li> <li>- To display the number of SQL steps Click [Display SQL steps] so that it is selected.</li> <li>- To display the SQL ratio Click [Display SQL ratio] so that it is selected.</li> <li>- To display comments Click [Display comments] so that it is selected.</li> <li>- To display the comment ratio Click [Display comment ratio] so that it is selected.</li> <li>- To display embedded information Click [Display embedded information] so that it is selected.</li> <li>- To display the folder name Click [Display folder name] so that it is selected.</li> <li>- To change the minimum value of comment ratio Click the black downward-pointing triangle of [Minimum Value of Comment Ratio], and select a value from the drop-down list. (Disabled for text measurement)</li> </ul>

### 6.4.11 [Step Measurement - Search Path] Options Dialog Box

---

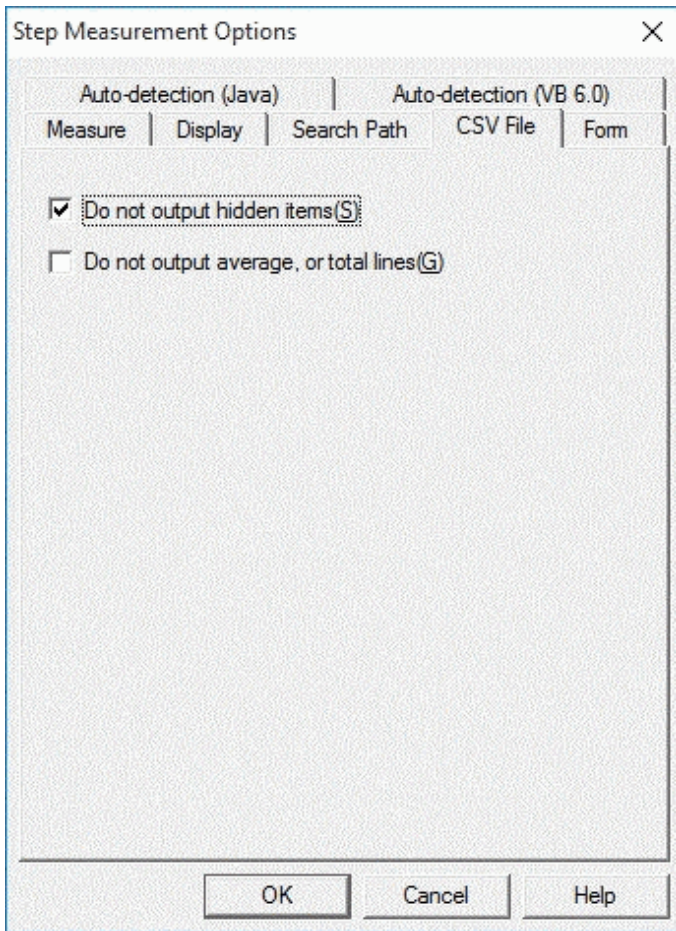

Specify search path related information.

Item	Description
[Folder]	The name of the folder set to be referenced from the [Browse] button is displayed. Direct manual entry is also available. Click the [Add] button to add it to the folder list.
[Folder List]	A list of registered folder names is displayed. <a href="#">Multiple selections</a> are possible. (Up to 10 folder paths can be registered.) Double-click a folder name, and the selected folder name is displayed in the [Folder] edit box. If the [Browse] button is clicked here, that folder is initially displayed in the [Browse for Folder] dialog box.
[Browse]	To browse folder names, click the [Browse] button. The [Browse for Folder] dialog box is displayed.
[Add]	With the [Folder] edit box displaying the folder name, click the [Add] button to add the folder name to [Folder List] as a search path.
[Delete]	Click the folder name to be deleted from [Folder List] and click the [Delete] button. <a href="#">Multiple selections</a> are also possible.

## 6.4.12 [Step Measurement - CSV File] Options Dialog Box

Set CSV file output item related information.

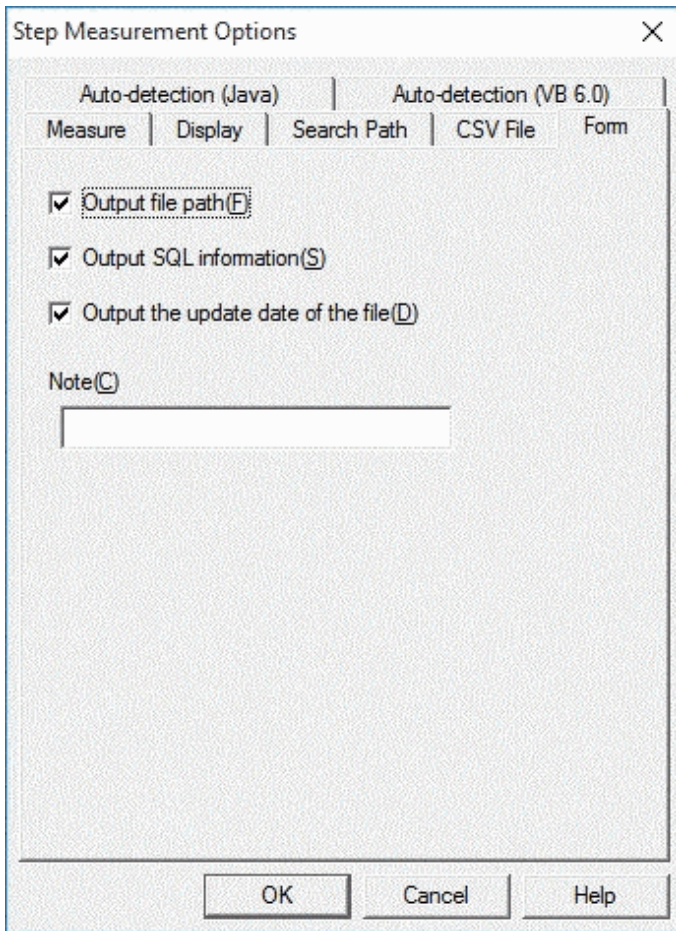

Item	Description
[Do not output hidden items]	- To prevent the output of hidden items to a CSV file Click [Do not output hidden items] so that it is selected.
[Do not output average, or total lines]	- To prevent the output of average, or total lines to a CSV file Click [Do not output average, or total lines] so that it is selected.

### 6.4.13 [Step Measurement - Form] Options Dialog Box

---

Allows specification of form dialog and form printing related information.

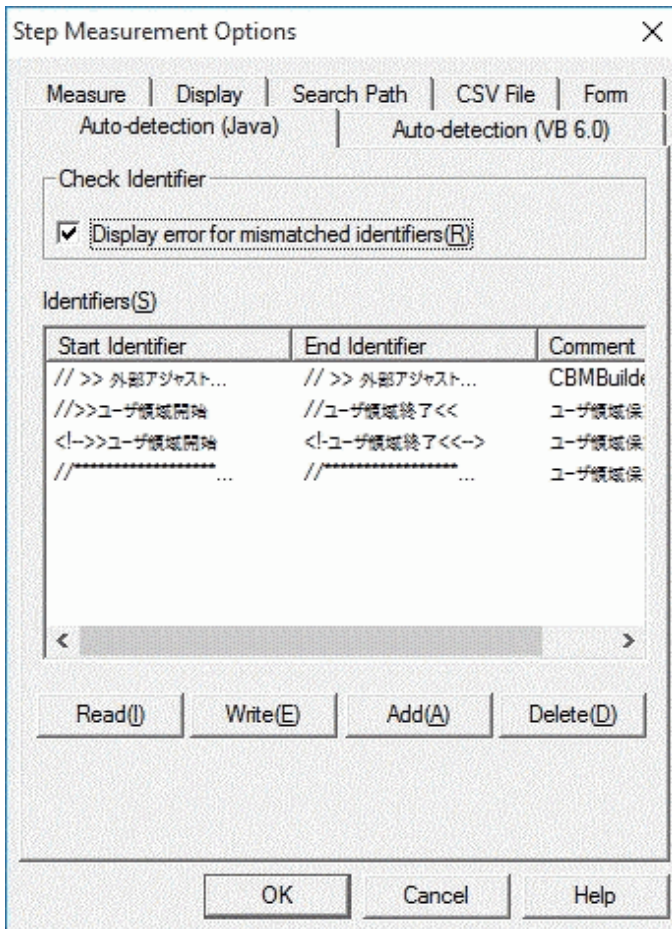

Item	Description
[Output file path]	- To output the folder name Click [Output file path] so that it is selected.
[Output SQL information]	- To output SQL step information Click [Output SQL information] so that it is selected.
[Output the update date of the file]	- To output the update date of the file Click [Output the update date of the file] so that it is selected.
[Note]	- To set a note Enter a 30-byte or shorter string in the [Note] edit box.

#### 6.4.14 [Step Measurement - Auto-detection (Java)] Options Dialog Box

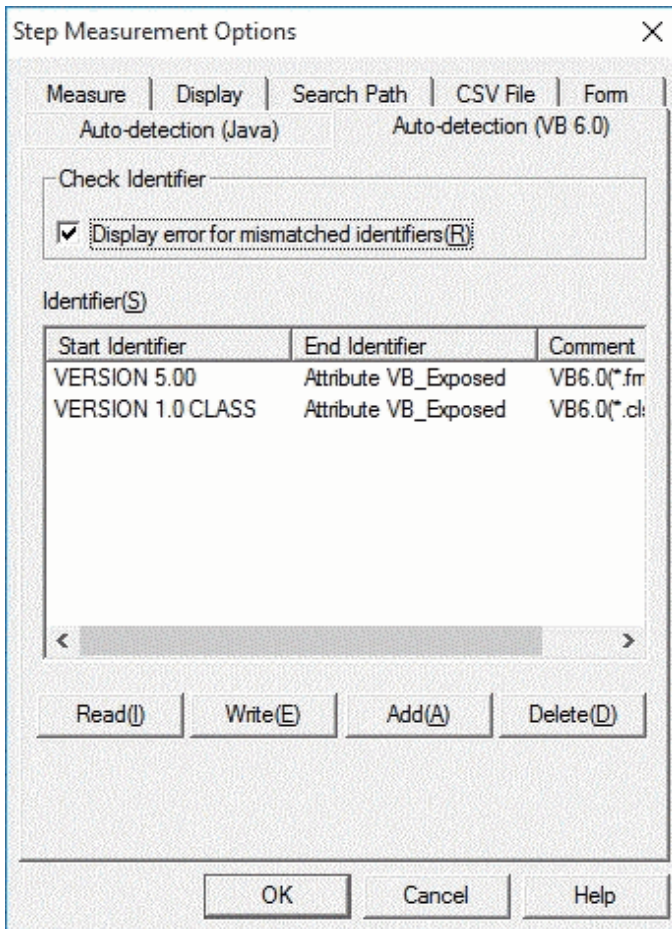

Allows specification of handwritten/auto-generation measurement related information for auto-generated Java source measurement.

Item	Description
[Display error for mismatched identifiers]	- To enable the display of errors for mismatched identifiers during measurement Click [Display error for mismatched identifiers] so that it is selected.
[Identifiers]	Registered start identifiers, end identifiers, and comments are displayed. <a href="#">Multiple selections</a> are possible. (Up to 100 pairs of identifiers can be specified.)
[Read]	To register the contents of an identifier file storing identifier information in the [Identifier] list, click the [Read] button. The [Specify File] dialog box is displayed. At this time, the identifiers registered in the [Identifier] list are deleted.
[Write]	To save the registered identifiers displayed in the [Identifier] list as an identifier list file, click the [Write] button. The [Specify File] dialog box is displayed.
[Add]	To add a new identifier to [Identifiers], click the [Add] button. The <a href="#">Specify Identifying String Dialog Box</a> is displayed.
[Delete]	Click the identifier to be deleted in [Identifiers] and click the [Delete] button. <a href="#">Multiple selections</a> are possible.

## 6.4.15 [Step Measurement - Auto-detection (VB6.0)] Options Dialog Box

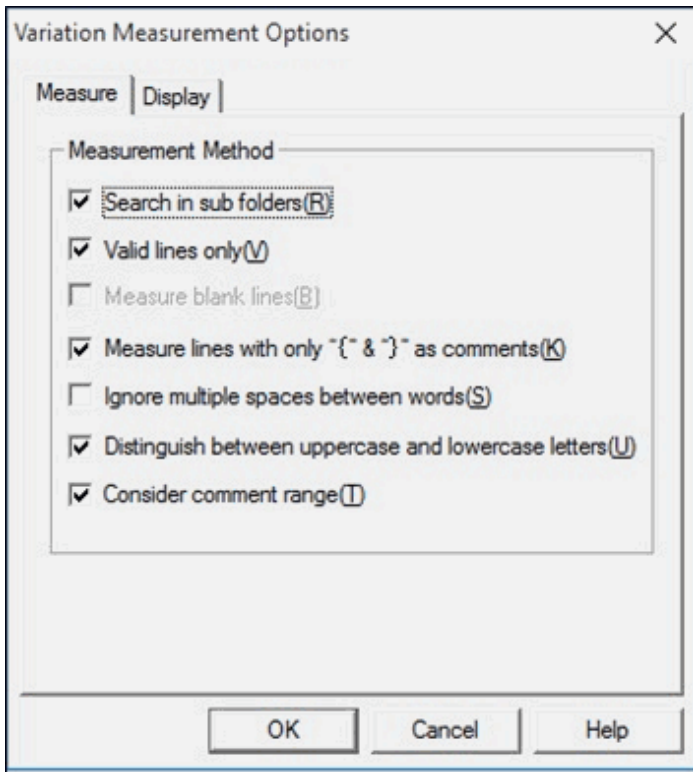

Allows specification of handwritten/auto-generation measurement related information for Visual Basic 6.0 source measurement.

Item	Description
[Display error for mismatched identifiers]	- To enable the display of errors for mismatched identifiers during measurement Click [Display error for mismatched identifiers] so that it is selected.
[Identifiers]	Registered start identifiers, end identifiers, and comments are displayed. <a href="#">Multiple selections</a> are possible. (Up to 100 pairs of identifiers can be specified.)
[Read]	To register the contents of an identifier file storing identifier information in the [Identifier] list, click the [Read] button. The [Specify File] dialog box is displayed. At this time, the identifiers registered in the [Identifier] list are deleted.
[Write]	To save the registered identifiers displayed in the [Identifier] list as an identifier list file, click the [Write] button. The [Specify File] dialog box is displayed.
[Add]	To add a new identifier to [Identifiers], click the [Add] button. The <a href="#">Specify Identifying String Dialog Box</a> is displayed.
[Delete]	Click the identifier to be deleted in [Identifiers] and click the [Delete] button. <a href="#">Multiple selections</a> are possible.

## 6.4.16 [Measure Variation - Measure] Options Dialog Box

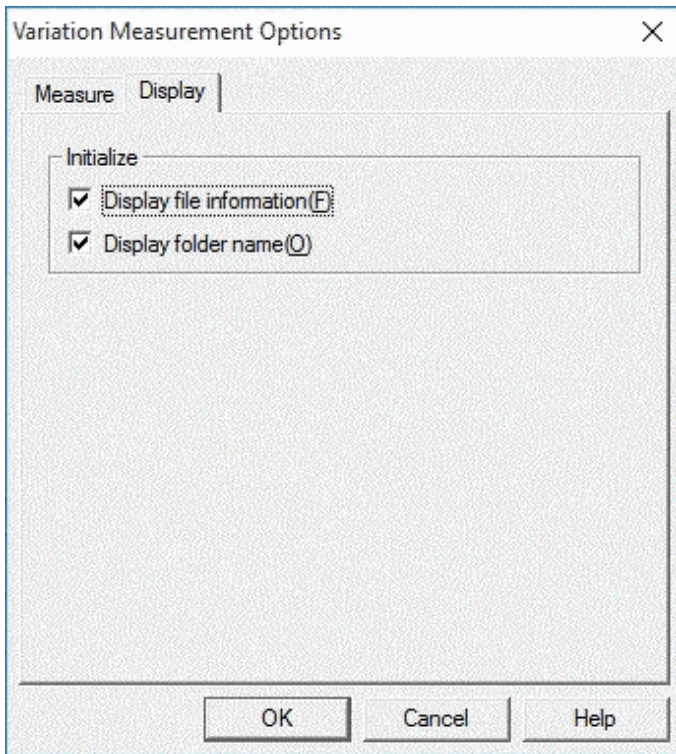

Using measurement options, configure the settings for the types of measurement results to be output and the measurement method to be used.

Item	Description
[Measurement Method]	<ul style="list-style-type: none"> <li>- To search in sub folders Click [Search in sub folders] so that it is selected.</li> <li>- To measure only valid lines Click [Valid lines only] so that it is selected.</li> <li>- Measure blank lines Click [Measure blank lines] so that it is selected.</li> <li>- Measure lines with only "{ &amp; }" as comments Click [Measure lines with only "{ &amp; }" as comments] so that it is selected.</li> <li>- To ignore the number of spaces in blank lines or between words in measurement Click [Ignore multiple spaces between words] so that it is selected.</li> <li>- To distinguish between uppercase and lowercase letters in measurement Click [Distinguish between uppercase and lowercase letters] so that it is selected.</li> <li>- To consider multi-line comments such as lines from /* to */ in measurement Click [Consider comment range] so that it is selected.</li> </ul> <p><b>Attention</b></p> <p>If [Valid lines only] is selected, [Measure blank lines] is disabled.</p>

### 6.4.17 [Measure Variation - Display] Options Dialog Box

Using display options, set the initial display of variation measurement.

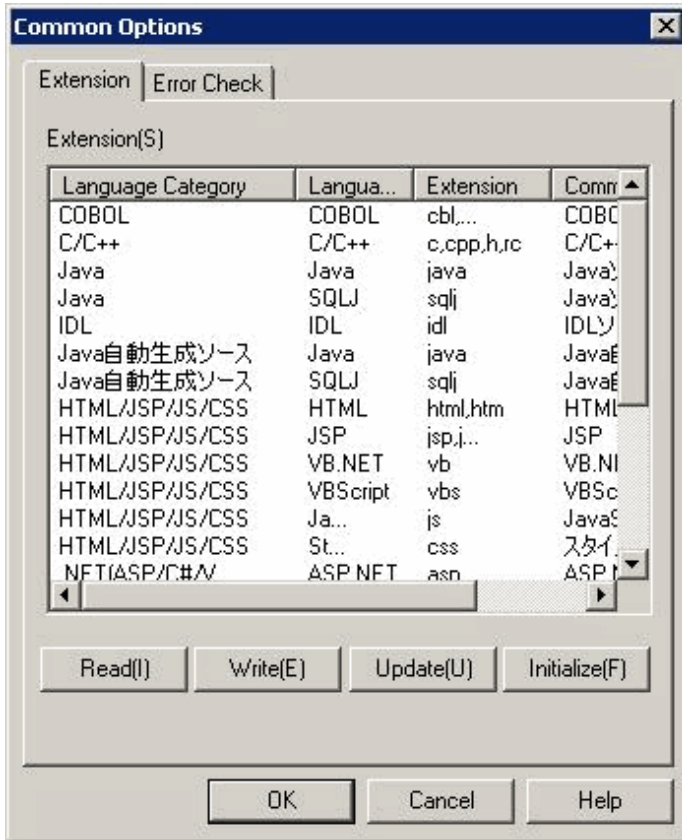

Item	Description
[Initialize]	<ul style="list-style-type: none"> <li>- To display file information Click [Display file information] so that it is selected.</li> <li>- To display the folder name Click [Display folder name] so that it is selected.</li> </ul>

### 6.4.18 [Common - Extension] Options Dialog Box

---

Change the extensions of assets.

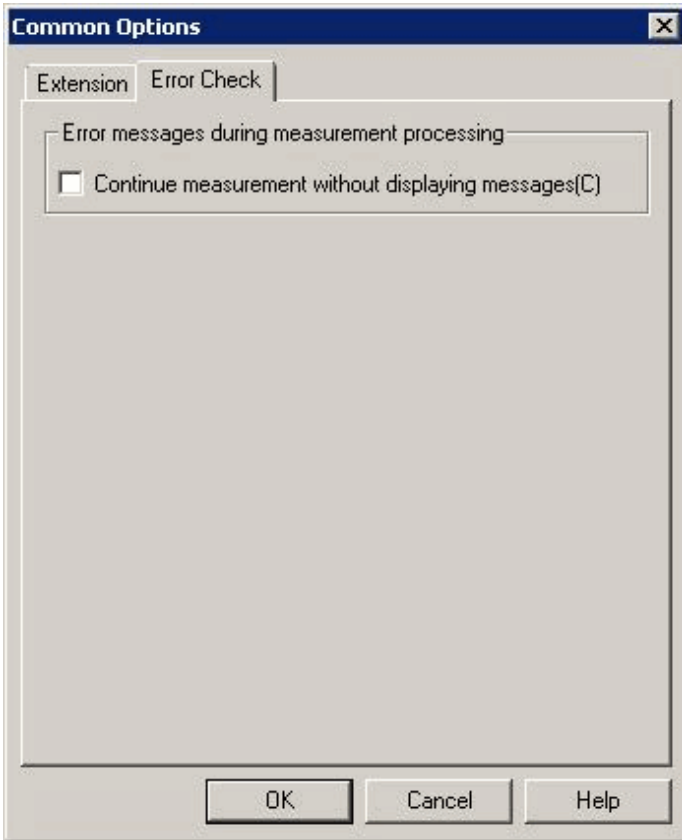

Item	Description
[Extension]	A list of language categories, language types, extensions, and comments is displayed.
[Read]	To read the contents of an extension file storing extension information into the [Extension] list, click the [Read] button. The [Specify File] dialog box is displayed. At this time, the extensions contained in the [Extension] list are deleted.
[Write]	To save the registered extensions displayed in the [Extension] list as an extension list file, click the [Write] button. The [Specify File] dialog box is displayed.
[Update]	To update [Extension] with new extensions, click the [Update] button. The <a href="#">Change Extensions Dialog Box</a> is displayed.
[Initialize]	To return modified extension information to its initial state at installation, click the [Initialize] button. The contents of the extension list are set to <a href="#">Default Extensions</a> .

### Attention

To apply the changes to the measurement results, it is necessary to execute [Measure All].

## 6.4.19 [Common - Error Check] Options Dialog Box

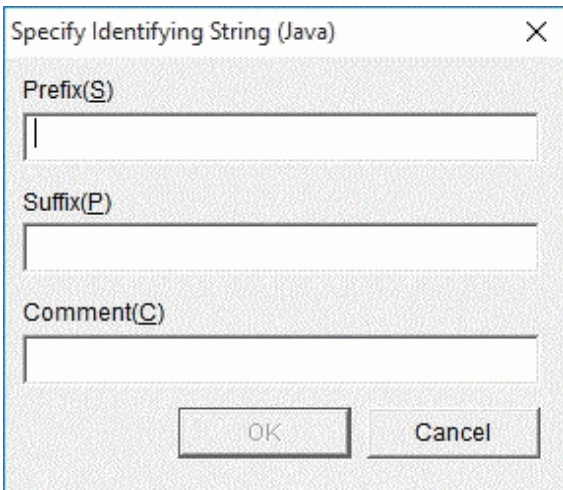

It sets about the behaviour when an error occurs during measurement processing.

Item	Description
[Error messages during measurement processing]	<p>- To continue measurement without displaying messages</p> <p>Click [Continue measurement without displaying messages] so that it is selected.</p> <p>If selected, even if an error occurs during the measurement process, the measurement process continues without displaying messages.</p> <p>(Please check the error file (Folder set in the environment variable TEMP \ MF_STP32.ERR) after measurement has ended.)</p>

### 6.4.20 Specify Identifying String (Java) Dialog Box

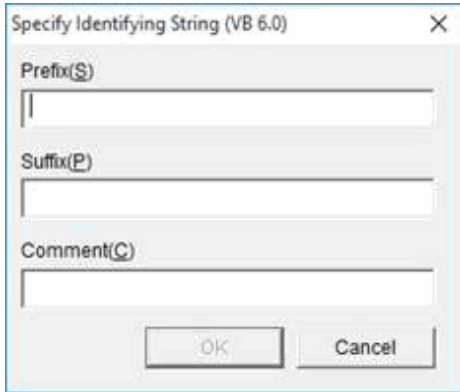

Set identifiers used to judge handwritten/auto-generation sections during auto-generated Java source measurement.

Item	Description
[Prefix]	Specify the start identifier.
[Suffix]	Specify the end identifier.
[Comment]	Specify a comment for the identifiers.

### 6.4.21 Specify Identifying String (VB 6.0) Dialog Box

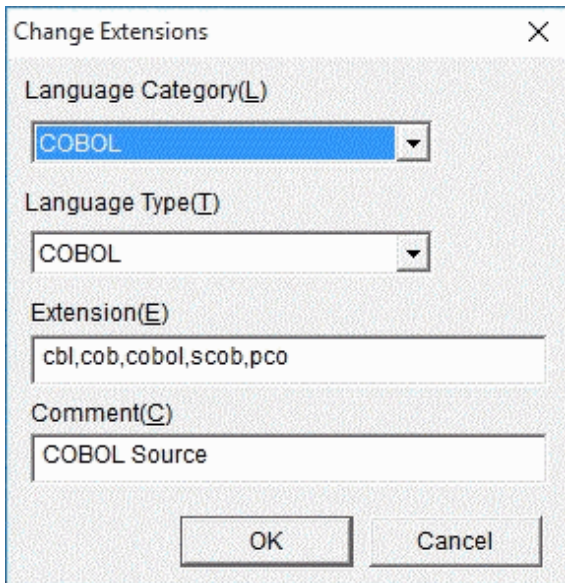

Set identifiers used to judge handwritten/auto-generation sections during Visual Basic 6.0 source measurement.

Item	Description
[Prefix]	Specify the start identifier.
[Suffix]	Specify the end identifier.
[Comment]	Specify a comment for the identifiers.

### 6.4.22 Change Extensions Dialog Box

Change extensions.

Item	Description
[Language Category]	Changing of the language category is prohibited.

Item	Description
[Language Type]	Changing of the language type is prohibited.
[Extension]	Edit the extension string. To specify multiple extensions, separate extensions with a comma (","). To delete an extension, clear the extension entry.
[Comment]	The comment for the extension can be changed.

**Attention**

- If the extension is blank, no measurement target is displayed for this language category and language type.

# Chapter 7 Description of Measurement Results

This chapter explains the Measurement Results by MF-STEP COUNTER.

## 7.1 Measurement Output Examples

This section provides measurement output examples.

### 7.1.1 Information of Embedded Member Steps (Form)

An output layout example (C/C++ form) of embedded member step information is shown below.

Click a link to refer to the details.

- Display/Hide the following items (depending on the language type of measurement)
  - File Information/Folder Name
- Copy data to the clipboard in CSV format

## 7.2 Description of Measurement Output Items

This section explains measurement output items.

### 7.2.1 Sequence Number

Output Item	Description
Sequence Number	The sequence number for a source/include file (library file)

### 7.2.2 Embedded Member Names

Output Item	Description
Embedded Member Name	The include (library) file name

The length of the file name that can be output varies depending on the language category and the form options (output of SQL steps, output of the date of the file). The rest of the file name that exceeds the maximum length is not output.

### 7.2.3 Breakdown of Steps

The breakdown of steps shows the number of measured steps of embedded members.

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
SQL	Embedded SQL Steps
SQL Ratio	The ratio of SQL to valid steps
ETC	Valid steps excluding SQL
ETC Ratio	The ratio of ETC to valid steps (*1)
Comment	Comment steps
Comment Ratio	The ratio of comments to total steps
Blank	Blank steps
Total	The total number of valid steps and comment steps

\*1: Not output in the list view mode.

## 7.2.4 Location

---

Output Item	Description
Location	The location where the library is expanded (not measured in C)

## 7.2.5 Cumulative Total Steps

---

Output Item	Description
Cumulative Total Steps	The cumulative total number of steps within the measurement target (the product of the number of include [library] steps and the number of uses)

## 7.2.6 Number of Times Used

---

Output Item	Description
Number of Times Used	The number of uses within the measurement target

## 7.2.7 Used Program and Embedded Member Names

---

The used program name and the embedded member name are the library expanded program name and library name or the include expanded program name and include name. As output information varies depending on the language category, refer to the following table for confirmation.

[COBOL]

Output Item	Description
Used Program and Embedded Member Names	(P) The expanded program name (C) The expanded library name (I) The expanded include name

[C/C++]

Output Item	Description
Used Program and Embedded Member Names	(P) The expanded program name (I) The expanded include name

The displayed file name can contain up to 12 characters. If the file name contains 13 or more characters, only the string up to the 12th character is displayed.

## 7.2.8 Note Item

---

Output Item	Description
Note Item	The string set with the relevant [Step Measurement - Form] option

## 7.2.9 Subtotal

---

Output Item	Description
Subtotal	The total in units of folders (if [Output file path] is specified as a [Step Measurement - Form] option)

## 7.2.10 Program Name

Output Item	Description
Program Name	The target file

The length of the file name that can be output varies depending on the language category and the [Step Measurement - Form] options (output of SQL steps, output of the date of the file). The rest of the file name that exceeds the maximum length is not output.

## 7.2.11 Total Steps

The total steps are the steps constituting one program. As the information output as total steps varies depending on the language category, refer to the following table for confirmation.

[COBOL]

Output Item	Description
Decl	The number of valid steps in the declaration division (steps from the head of the program to the line preceding PROCEDURE DIVISION)
Decl Ratio	The ratio of declaration steps to total steps (*1)
SQL (Declaration Division)	Number of embedded SQL steps in the declaration division
SQL Ratio (Declaration Division)	The ratio of SQL to declaration steps
ETC (Declaration Division)	Number of declaration steps, excluding SQL
ETC Ratio (Declaration Division)	The ratio of ETC to declaration steps (*1)
Execution	Number of valid steps in the execution division (steps following PROCEDURE DIVISION)
Execution Ratio	The ratio of execution steps to total steps (*1)
SQL (Execution Division)	Number of embedded SQL steps in the execution division
SQL Ratio (Execution Division)	The ratio of SQL to execution steps
ETC (Execution Division)	Number of execution steps, excluding SQL
ETC Ratio (Execution Division)	The ratio of ETC to execution steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of declaration division steps, execution division steps, and comment steps

[C/C++]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
SQL	Embedded SQL Steps
SQL Ratio	The ratio of SQL to valid steps
ETC	Valid steps excluding SQL
ETC Ratio	The ratio of ETC to valid steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps

Output Item	Description
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[Java, Auto-generated Java Source]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
SQL	Embedded SQL Steps
SQL Ratio	The ratio of SQL to valid steps
ETC (Valid Lines)	Valid steps excluding SQL
ETC Ratio (Valid Lines)	The ratio of ETC to valid steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Javadoc	Number of Javadoc steps
Javadoc Ratio	The ratio of Javadoc to comment steps
ETC (Comment Lines)	Number of comment steps, excluding Javadoc
ETC Ratio (Comment Lines)	The ratio of ETC to comment steps (*1)
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[IDL]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[HTML/JSP/JS/CSS]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[.NET (ASP/C#/VB)/HTML/JS/CSS]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[VB 6.0]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

[TEXT]

Output Item	Description
Valid	Steps excluding comments
Validity Ratio	The ratio of valid steps to total steps (*1)
Cmnt	Comment steps
Cmnt Ratio	The ratio of comments to total steps
Blank Lines	Blank steps
Sum	The total number of valid steps and comment steps

\*1: Not output in the list view mode.

## 7.2.12 Handwritten Steps

Handwritten steps are the steps excluding include files/copy library steps or steps in the handwritten division. As the information counted as handwritten steps varies depending on the language category, refer to the following table for confirmation.

Language Category	Description
COBOL	Number of steps, excluding libraries
C/C++	Number of steps, excluding include files
Java	Not output
IDL	Not output
Auto-generated Java Source	Steps in the handwritten division
HTML/JSP/JS/CSS	Not output
.NET (ASP/C#/VB)/HTML/JS/CSS	Not output
Visual Basic 6.0	Steps in the handwritten division
TEXT	Not output

\* For details on the formats, refer to the Total Steps section.

## 7.2.13 Embedded Steps

Embedded steps are include files/libraries/auto-generation steps. As the information counted as embedded steps varies depending on the language category, refer to the following table for confirmation.

Language Category	Description
Auto-detection	Output depending on the language category of the measurement target file
COBOL	Number of library steps (*1)
C/C++	Number of include file steps (*1)
Java	Not output
IDL	Not output
Auto-generated Java Source	Auto-generation steps (*2)
HTML/JSP/JS/CSS	Not output
.NET (ASP/C#/VB)/HTML/JS/CSS	Not output
Visual Basic 6.0	Auto-generation steps (*2)
TEXT	Not output

\* For details on the formats, refer to the Total Steps section.

\*1: Information of embedded member steps (form and list view) can be output.

\*2: Information of embedded member steps (form or list view) cannot be output.

## 7.2.14 Embedded Type

Output by embedded type is the total number of embedded member steps by copy library call type or by include file call type. As output information varies depending on the language category, refer to the following table for confirmation.

[COBOL]

Output Item	Description
C (COPY)	The total number of steps of members (copy libraries) embedded via COPY phrase calling
C Ratio	The ratio of C (COPY) to embedded steps (*1)
I (INC)	The total number of steps of members (copy libraries) embedded via INCLUDE phrase calling
I Ratio	The ratio of I (INC) to embedded steps (*1)

[C/C++]

Output Item	Description
I (inc)	The total number of steps of members (include files) embedded via include calling
I Ratio	The ratio of I (inc) to embedded steps (*1)
R (rc)	The total number of steps of members (include files) embedded via rcinclude calling
R Ratio	The ratio of R (rc) to embedded steps (*1)

\* Not output in the case of [Java], [IDL], [auto-generated Java source], [HTML/JSP/JS/CSS], [.NET (ASP/C#/VB)/HTML/JS/CSS], or [TEXT].

\*1: Not output in the list view mode.

## 7.2.15 Update Date

Output Item	Description
Update Date	The update date of the target file. (If [Output the update date of the file] is specified as a [Step Measurement - Form] option)  The display format with update is different according to the format of the region and the language of OS setting.  When [Japanese (Japan)] is selected, it displays it by [yyyy/MM/dd HH:mm:ss].  It displays it by [MM/dd/yyyy HH:mm:ss] when selecting it excluding [Japanese (Japan)].

## 7.2.16 File Information

Output Item	Description
File Name	Target File Name
Type	The language name of the target file For details, refer to the note section of <a href="#">[New Measurement]</a>
Size	The logical size of the target file
Update Date	The update date of the target file

## 7.2.17 Folder Name

Output Item	Description
Folder Name	Target file folder name

## 7.2.18 Total

Output Item	Description
Total	The total number of all measurement target assets

## 7.2.19 Average

Output Item	Description
Average	The value derived from the total number of all measurement target assets averaged by the number of measurements

## 7.2.20 Valid Steps (Variation Measurement)

Valid steps of old and new assets are output for each item as follows.

Output Item	Description
Insertion	Number of valid steps judged as "inserted" in the new asset
Variation	Number of valid steps judged as "modified" in the new asset (The total number of valid steps from pairs judged as "modified" in the old and new assets*)
Deletion	Number of valid steps judged as "deleted" in the new asset
All Old	Number of valid steps in all of the old assets
All New	Number of valid steps in all of the new assets

\* Refer to the measurement examples of [4.2 Variation Measurement Criteria](#).

## 7.2.21 Comment Steps (Variation Measurement)

Comment steps of old and new assets are output for each item as follows.

Output Item	Description
Insertion	Number of comment steps judged as "inserted" in the new asset
Variation	Number of comment steps judged as "modified" in the new asset (The total number of comment steps from pairs judged as "modified" in the old and new assets*)
Deletion	Number of comment steps judged as "deleted" in the old asset
All Old	Number of comment steps in all of the old assets
All New	Number of comment steps in all of the new assets

\* Refer to the measurement examples of [4.2 Variation Measurement Criteria](#).

## 7.2.22 Total Steps (Variation Measurement)

Total number of comment steps of old and new assets are output.

Output Item	Description
Old	Total number of steps in the old assets
New	Total number of steps in the new assets

\* Note that if "Valid lines only" (default) is selected in [5.11.8 \[Measure Variation - Measure\] Option Settings](#), the total steps are equal to the valid steps. \* In addition, depending on the other selected measurement options, measurement values vary. For example, blank lines are also included in the total steps as comment lines by default, but if [\[Measure blank lines\]](#) is not selected in [5.11.8 \[Measure Variation - Measure\] Option Settings](#), blank lines are not counted as steps.

## 7.3 Measurement Error Output Examples

This section provides measurement error output examples.

### 7.3.1 Information of Embedded Member Steps (Form)

An output layout example (C/C++ form) for an error in the measurement target file is shown below.

Output Item	Output Method
File Update Date	Not output if there is an error in the measurement target file.
Steps	Output as a 10-digit "*" string if there is an error in the measurement target file. (No. 2 example)
Ratio	Output as a 3-digit "*" string if there is an error in the measurement target file. (No. 2 example)
Total	Not added if there is an error in the measurement target file.
Average	Not counted if there is an error in the measurement target file.

No.	Embedded Steps Member	Step Breakdown	Location	Cumulative Ttl Steps	Repeated	Used Program & Embedded Member Name
C:\temp						
1	inc10.h 01/07/2016 19:27:48	Valid 1 ( 33%) Cnt 1 ( 33%) Blank 1 ( 33%) Sum 3	—	3	1	(P) sample10.c
2	inc20.h	Valid***** (***%) Cnt ***** ( 0%) Blank***** ( 0%) Sum *****	—	*****	****	(P) sample20.c
3	inc30.h 01/07/2016 19:27:48	Valid 1 ( 33%) Cnt 1 ( 33%) Blank 1 ( 33%) Sum 3	—	3	1	(P) sample20.c
	Subtotal	Valid 2 ( 33%) Cnt 2 ( 33%) Blank 2 ( 33%) Sum 6				
Total						
	Total	Valid 2 ( 33%) Cnt 2 ( 33%) Blank 2 ( 33%) Sum 6				
	Average	Valid 1 ( 33%) Cnt 1 ( 33%) Blank 1 ( 33%) Sum 3				

\* The form image varies slightly depending on the language category.

\* SQL steps and SQL ratio are not output.

## 7.3.2 Information of Embedded Member Steps (List View)

An output layout example (C/C++ List view) for an error in the measurement target file is shown below.

Output Item	Output Method
File Size	Output as 0 if there is an error in the measurement target file.
File Update Date	Not output if there is an error in the measurement target file.
Steps	Output as a 10-digit "*" string if there is an error in the measurement target file. (The second line in the example)

Output Item	Output Method
Ratio	Output as a 4-digit "*" string if there is an error in the measurement target file. (The second line in the example)
Total	Not added if there is an error in the measurement target file.
Average	Not counted if there is an error in the measurement target file.

File				Step Breakdown					Embedded Information			Folder	
File Name	Type	Size	Update Date	Valid	Cmnt	Cmnt Ratio	Blank	Sum	Location	Cumulative Ttl Steps	Repeated	Used Program & Embedded Member Name	Folder Name

An output layout example (C/C++ form) for an error in the measurement target file is shown below.

Output Item	Output Method
File Update Date	Not output if there is an error in the measurement target file.
Steps	Output as a 10-digit "*" string if there is an error in the measurement target file. (No. 2 example) "*" is added as a prefix to steps if there is an error in the embedded member. (No. 3 example)
Ratio	Output as a 3-digit "*" string if there is an error in the measurement target file. (No. 2 example) "*" is added as a prefix to the ratio if there is an error in the embedded member. (No. 3 example)
Total	Not added if there is an error in the measurement target file. Added even if there is an error in the embedded member.
Average	Not counted if there is an error in the measurement target file. Counted even if there is an error in the embedded member.

No.	Program Name	Step Breakdown			Embedded Type
		Total Steps	Handwritten Steps	Embedded Steps

## 7.3.4 Program Step Information (List View)

An output layout example (C/C++ List view) for an error in the measurement target file is shown below.

Output Item	Output Method
File Size	Output as 0 if there is an error in the measurement target file.
File Update Date	Not output if there is an error in the measurement target file.
Steps	Output as a 10-digit "*" string if there is an error in the measurement target file. (The second line in the example)

Output Item	Output Method
	"*" is added as a prefix to steps if there is an error in the embedded member. (The third line in the example)
Ratio	Output as a 4-digit "*" string if there is an error in the measurement target file. (The second line in the example) "*" is added as a prefix to the ratio if there is an error in the embedded member. (The third line in the example)
Total	Not added if there is an error in the measurement target file. Added even if there is an error in the embedded member.
Average	Not counted if there is an error in the measurement target file. Counted even if there is an error in the embedded member.

File				Total Steps				Handwritten Steps				Embedded Steps				Embedded Type					
File Name	Type	Size	Update Date	Valid	Cmnt	Cmnt Ratio	Blank	Sum	Valid	Cmnt	Cmnt Ratio	Blank	Sum	Valid	Cmnt	Cmnt Ratio	Blank	Sum	inc	rc	
sample10.c	C/C++	2,364	01/07/2016 19:30:11	32	8	19%	3	43	31	7	17%	2	40	1	1	33%	1	3	3	.....	
sample15.c	C/C++	0		*****	*****	*****	***	*****	*****	*****	*****	***	*****	*****	*****	*****	*****	*****	*****	3	.....

# Chapter 8 Supplementary Notes

This chapter provides supplementary information on MF-STEP COUNTER.

## 8.1 Advisory Notes

The precautions to be observed when using SIMPLIA MF-STEP COUNTER are as follows.

- SIMPLIA MF-STEP COUNTER cannot handle 260-byte or longer paths.
- Source files larger than 4 GB cannot be measured.
- Search path specification supports up to 10 paths. It is not possible to specify 11 or more paths.
- If the [Measure embedded members] measurement option is specified, and if embedded members are specified as measurement target files, measurement cannot be performed properly.
- Embedded members can be nested using up to 8 levels of hierarchy. Nested levels deeper than this are ignored in measurement.
- The measurement target asset is based on the assumption that it has been described correctly according to the syntax of each language.
- The paper size for printing is fixed as A4 portrait. If a format other than this is specified, the results of printing are not guaranteed.
- The comment column of a form can contain up to 15 Japanese characters or up to 30 one-byte alphanumeric characters. Characters exceeding this limit cannot be specified.
- Files specified by the embedded SQL include (EXEC SQL INCLUDE, \$include) statements are not regarded as the targets of embedded members.
- COPY libraries and include files (such as #include) in embedded SQL are not regarded as the targets of embedded members.
- Average and ratio calculations are all rounded off to whole numbers.
- As an effect of rounding errors, if the number of target assets or the asset size is particularly small, value inconsistencies or abnormal values (such as a value exceeding 100%) may be displayed.
- The form mode and the list view mode use differing methods for calculating average values, so the values may not be consistent.
- As SIMPLIA MF-STEP COUNTER uses the following font, this font must be installed in the Windows system.
  - MS Mincho
- The display resolution should be 640 x 480 or higher.
- For the reading of an identifier file (AJD file), use a file output from the [Step Measurement - Auto-detection (Java)] options dialog box or [Step Measurement - Auto-detection (VB 6.0)] options dialog box.
- For the reading of an extension file (AJD file), use a file output from the [Common - Extension] options dialog box.
- For measurement target assets, specify files of the language category with the extension specified in the [Common - Extension] options dialog box.
- The character code of following output files has been changed from V60L12.

File Type	V60L11 or earlier	V60L12 or later
CSV (measurement results) file	ShiftJIS	UTF-8 with BOM (Byte Order Mark)
Measurement results log file	ShiftJIS	UCS2 little endian with BOM (Byte Order Mark)
Identifier file	ShiftJIS	UCS2 little endian without BOM (Byte Order Mark)
Extension file	ShiftJIS	UCS2 little endian without BOM (Byte Order Mark)

Note that if you have used V60L11 or earlier so far and replace it with V60L12 or later this time, you have to change the file name of measurement results log file. Otherwise, you will not be able to browse the log data due to newly appended data written in different character code.

## About Step Measurement

- About embedded member folder searches

In addition to the folders specified with the [Step Measurement - Search Path] options, the folders of the assets are also searched. In the absence of [Step Measurement - Search Path] option specification, only the folders of assets are searched.

The folders specified with the [Step Measurement - Search Path] option are given priority when performing searches.

- If [Measure embedded members] is checked as a [Step Measurement - Measure] option, measurement requires more time as it becomes more complex due to elements such as the number of embedded member calls and the depth of configuration and hierarchies. It is recommended to uncheck this option unless it is necessary.
- If [Auto-generated Java Source] is selected as the measurement language category, source containing no pair of automatic identifiers as specified in the Auto-detect Java option settings is measured entirely as auto-generated source (embedded steps).
- If [Visual Basic 6.0] is selected as the measurement language category, source that contains no pair of automatic identifiers specified in the Auto-detect VB 6.0 option settings is measured entirely as handwritten steps.
- In the step measurement, when the byte number of one line of the measurement assets exceeds 131,072 bytes, the measurement result is not guaranteed.

## About Variation Measurement

- The following measurements that can be performed in step measurement have the following restrictions in variation measurement.
  - COBOL and C/C++ embedded member expanded measurement is not possible.
  - Embedded SQL in COBOL and C/C++ cannot be measured separately (It is included in valid/comment steps).
  - COBOL declaration divisions and execution divisions cannot be measured separately.
  - Measurement by COBOL program ID is not possible. Measurement is performed by file unit.
- Old and new files with different names can be compared if the [File] specification method is selected as the asset specification method, but only files with the same names are compared if the [Folder] specification method is selected. To include subfolders in the measurement, the subfolders must also have the same name.
- Note that total steps vary depending on the [Measure Variation - Measure] Options specified.  
Example: In [Valid lines only] measurement, total steps are equal to the steps of valid lines only.
- In the variation measurement, the number of actual lines of the measurement asset and the number of steps of measurement results might be different because when the size of one line of the measurement asset exceeds 1,024 bytes, the value that is divided by 1,024 and rounded up is taken as the number of steps.

## About Forms

- The length of the file name that can be output varies depending on the language category and the form options (output of SQL steps, output of the date of the file). The rest of the file name that exceeds the maximum length is not output.
- The number of maximum display columns in form mode is 8. Therefore, when there is a value that exceeds 8 columns in the measurement results, the portion will be shown by "\*" and the message that a part of the measurement results cannot be shown will be displayed.  
The part of "\*" can be seen by generating the CSV file.

## About List View

- About the minimum value of comment ratio

The compared values are the data for display. As display data is rounded off to whole numbers, values not originally regarded as targets for red display are displayed in red.

Example: If the minimum value of comment ratio is set to 20%, the following value is also displayed in red.

**20%** (It is actually 20.1% but is displayed as 20% on screen, as it has been rounded off)

\* If the language category of the measurement target asset is [TEXT], the setting is disabled. (The minimum value of comment ratio is always displayed in black.)

- About file category judgment in Java

If multiple class/interface definitions are present in one file, the first class/interface is used for judgment.

- The list view cannot be printed. After performing CSV file output, edit and print the results using an application such as Excel or other spreadsheet software.
- The sorting order (ascending or descending) specified on each column is initialized when the list view dialog is closed. In addition, when program information and embedded member information are both displayed, corresponding items are not synchronized.
- The display folder setting is initialized when the list view dialog is closed.
- The comment ratio is derived from "100% - [Declaration Division Valid Steps %] - [Execution Division Valid Steps %]" and may not be consistent with the comment ratio calculated from comment steps and total steps.
- The number of maximum display columns in list view mode is 8. Therefore, when there is a value that exceeds 8 columns in the measurement results, the portion will be shown by "\*" and the message that a part of the measurement results cannot be shown will be displayed.  
The part of "\*" can be seen by generating the CSV file.

### About Measurement Target Assets

- If the measurement target asset contains a linefeed code other than "CR+LF", measurement results are not guaranteed.
- As source files described in Shift JIS or UNICODE (UTF-8 or UCS2 [Big Endian or Little Endian] with BOM [Byte Order Mark]) are measurement targets, measurement results from source files described in other character codes are not guaranteed.
- In variation measurement, up to 30,000 steps are supported per file. However, when measuring valid lines only, up to 30,000 valid steps are supported (The total number of steps can exceed 30,000).
- Depending on the character code, the size of one line that can be measured are as follows.

Character code	Size
ShiftJIS	131,072 bytes (including CR/LF)
UTF-8	131,072 bytes (including CR/LF)
UCS2 little endian with BOM (Byte Order Mark)	131,072 bytes (including CR/LF)
UCS2 big endian with BOM(Byte Order Mark)	The size of one line when converting UTF-8 is 131,072 bytes (including CR/LF)

### About Measurement of COBOL

- In the source file, the start of the identification division (IDENTIFICATION DIVISION) and the start of the procedure division (PROCEDURE DIVISION) must be described. If either of or both of these are not described or are described in a COPY phrase library file, measurement cannot be performed properly.
- The COBOL free source format is not supported.
- If a program file or COPY phrase library file contains tabs across the sequence number area (1st to 6th columns), the indicator area (7th column), or the A area (8th to 12th columns), measurement is not performed properly.
- If measurement target assets are specified by folder unit when embedded members are to be measured, and if embedded members are located in the specified folder or in a subfolder of the specified folder, embedded members are also measured as program steps regardless of whether those folders are specified in the search path. Place embedded members in a different location from the specified folder.

### About Measurement of C/C++

- If #include and rcinclude are described in the continuation lines of string constants they are recognized as embedded commands.  
Example: In the following case, "AAA.H\" is recognized as an embedded member name and searched as a measurement target.  
strcpy(szBuf,"ABCDEFGH \

```
#include \"AAA.H\";
```

### **About Measurement of Auto-generated Java Source & Visual Basic 6.0**

- It is not possible to register more than 100 extensions.
- In Auto-generated Java Source or Visual Basic 6.0 measurement, the following extensions are exempt from judgment.
  - Start identifiers and end identifiers nested within another start identifier and end identifier pair
  - Invalid end identifiers that are not properly combined with start identifiers
  - End identifiers whose corresponding start identifiers are missing
- The identifiers pre-defined as standard for VB6.0 are not based on the published specifications from Microsoft. Therefore, edit or add identifiers if measurement is inaccurate.
- The Auto-detect VB 6.0 option provided as standard has the following restriction.
  - It has been confirmed that some \*.cls files contain lines with "Attribute VB\_Ext\_KEY" attributes even after a line of the "Attribute VB\_Exposed" attribute. These lines are measured as handwritten lines.

### **About Measurement of ASP**

- If a linefeed is inserted in the middle of a <SCRIPT> tag in which "language" and "type" attributes are described, an incorrect script attribute will be used in measurement.

### **About Character Code**

- If an incorrect character code is specified, measurement results are not guaranteed.
- If assets of different character codes are measured at the same time, the measurement results of files whose character code is not the specified one are not guaranteed.

# Chapter 9 Messages

This chapter explains the details of errors output in MF-STEP-COUNTER.

## 9.1 Message List

---

- STP-001 Failed to open the intermediate file,[file name].
- STP-002 Failed to write to the intermediate file,[file name].
- STP-003 Failed to output the results.
- STP-004 Failed to open the measurement results file,[file name].
- STP-005 Failed to write to the measurement results file,[file name].
- STP-006 The format of the measurement result file,[file name], is incorrect.
- STP-007 Error in the file format of the measurement target file,[file name].
- STP-008 Failed to open the measurement target file,[file name].
- STP-009 The measurement target file,[file name], contains an invalid comment statement (Line [number]).
- STP-010 The measurement target file,[file name], contains an invalid SQL statement (Line [number]).
- STP-011 The file, [file name], has more than 30,000 lines.
- STP-012 There are [number] measurement errors. Check the error file.
- STP-013 Unable to output. There are too many lines of code.
- STP-014 Failed to open the CSV file,[file name].
- STP-015 Failed to write to the CSV file,[file name].
- STP-016 Error in page specification.
- STP-017 There is an error in the number of copies specified.
- STP-018 The printer cannot be used.
- STP-019 Unable to print, there is insufficient disk space for spooling.
- STP-020 Unable to print, there is insufficient memory for spooling.
- STP-021 There is an error in the report type specification.
- STP-022 The results have not been saved.Save the results now?
- STP-023 There is insufficient memory to display the message.
- STP-024 Failed to obtain the TEMP folder.
- STP-025 Opening of the assets folder name file failed.
- STP-026 Opening of the assets file name file failed.
- STP-027 The specified folder does not exist.
- STP-028 The specified string is not a folder name.
- STP-029 A folder with the same name already exists.
- STP-030 A lower hierarchy folder of the specified folder already exists.
- STP-031 A higher layer folder of the specified folder already exists.
- STP-032 There are no folders registered.
- STP-033 There are no files registered.

- STP-034 The result file format is not supported.
- STP-035 More than the maximum of number cannot be specified for the identification string.
- STP-036 The identification string already exists.
- STP-037 The combination of the identifiers is invalid.FILE:[file name] LINE:No.[number]
- STP-038 Reading of the identifier file failed.File:[file name].
- STP-039 Writing to the identifier file failed.File:[file name].
- STP-040 The contents will be erased and identifiers obtained from the file.Are you sure?
- STP-041 The tag (Starting at line [number]) in the measurement target file, [file name], is incorrect.
- STP-042 An old result file was read.When measuring by program ID, please review the option settings.
- STP-043 An old result file was read.When measuring the header file (\*.h) as program step information, please review the option settings.
- STP-044 An input/output error occurred during code conversion of the measurement target file,[file name].
- STP-045 The contents will be erased and extensions obtained from the file.Are you sure?
- STP-046 Reading of the extension file failed.FILE:[file name]
- STP-047 Writing to the extension file failed.FILE:[file name]
- STP-048 More than 10 extensions cannot be specified in the extension string.
- STP-049 Please specify the extension string using between 1 and 10 characters.
- STP-050 There is an invalid character in the extension.
- STP-051 Japanese characters (2-bytes) cannot be specified.
- STP-052 The extension already exists.
- STP-053 It is already specified in the same language category record.
- STP-054 The development language of the file,[file name], cannot be identified.
- STP-055 Multiple starts are prohibited.
- STP-056 Use in the trial version is not possible.
- STP-057 Unable to find the file.
- STP-058 Error in the number of files.
- STP-059 Please specify a folder name.
- STP-060 Creation of header control failed.
- STP-061 Creation of list control failed.
- STP-062 Failed to secure memory.
- STP-063 Select one line to change.
- STP-064 The same file name already exists.
- STP-065 The contents will be erased and extensions initialized. Are you sure?
- STP-066 Please specify the language type.
- STP-067 The size of measurement target file ,[file name], exceeds the limit.

## 9.2 Message Details

---

---

### **STP-001 Failed to open the intermediate file,[file name].**

Opening of the intermediate file used internally by MF-STEP COUNTER failed. Intermediate files are all stored in the folder named [Folder set in the TEMP environment variable\mfstptmp\_32] and deleted together with the mfstptmp\_32 folder when MF-STEP COUNTER is closed.

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

1. Intermediate files were deleted during the startup of MF-STEP COUNTER.
2. Media defect.

#### **Corrective Actions**

Check whether the folder (drive) set in the "TEMP" environment variable is accessible.

---

### **STP-002 Failed to write to the intermediate file,[file name].**

Writing to the intermediate file used internally by MF-STEP COUNTER failed. Intermediate files are all stored in the folder named [Folder set in the TEMP environment variable\mfstptmp\_32] and deleted together with the mfstptmp\_32 folder when MF-STEP COUNTER is closed.

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

1. An exclusion error in the intermediate file.
2. The folder (drive) set in the "TEMP" environment variable has insufficient space.
3. Media defect.

#### **Corrective Actions**

Check whether the folder (drive) set in the "TEMP" environment variable is accessible.

---

### **STP-003 Failed to output the results.**

An error occurred while outputting the document to the screen or printer.

#### **Message output destination**

Display

#### **Assumed Causes**

1. The intermediate file was not created properly. (An error occurred before opening or writing to the intermediate file.)
2. When reading, the contents of the specified measurement results file are incorrect.

#### **Corrective Actions**

When reading, specify the measurement results file with the correct contents.

---

### **STP-004 Failed to open the measurement results file,[file name].**

Opening of the specified measurement results file failed.

#### **Message output destination**

Display, Error File

### Assumed Causes

1. When reading, the specified measurement results file does not exist. (The name is incorrect.)
2. Media defect.

### Corrective Actions

Check whether the storage folder for the measurement results file is accessible. When reading, specify the correct measurement results file name.

---

### **STP-005 Failed to write to the measurement results file,[file name].**

Writing to the specified measurement results file failed.

### Message output destination

Display

### Assumed Causes

1. An exclusion error in the measurement results file.
2. The storage folder (drive) for the measurement results file has insufficient space.
3. Media defect.

### Corrective Actions

Check whether the storage folder for the measurement results file is accessible.

---

### **STP-006 The format of the measurement result file,[file name], is incorrect.**

There is an error in the contents of the specified measurement results file.

### Message output destination

Display

### Assumed Causes

1. A file other than a measurement results file was specified and read.
2. The measurement results file is corrupt.
3. Media defect.

### Corrective Actions

Specify the measurement results file with the correct contents.

---

### **STP-007 Error in the file format of the measurement target file,[file name].**

There is an error in the contents of the measurement target source file.

### Message output destination

Display, Error File

### Assumed Causes

1. A file other than a text file was specified as the measurement target.
2. The specified character code and the measurement target file code are inconsistent.

### Corrective Actions

Files other than text files cannot be specified as measurement targets. Specify the correct source files as measurement targets.

Additionally, when an incorrect code is specified, measurement results are not guaranteed. Ensure that the character code and the source file code are consistent.

---

### **STP-008 Failed to open the measurement target file,[file name].**

Opening of the measurement target source file failed.

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

1. The specified source file does not exist.
2. Media defect.

#### **Corrective Actions**

Confirm that the measurement target source file exists.

---

### **STP-009 The measurement target file,[file name], contains an invalid comment statement (Line [number]).**

There is an error in a comment in the measurement target source file. (This is reported when C/C++, Java, Auto-generated Java Source, or IDL files are measured.)

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

The comment end symbol (\*/) corresponding to a comment start symbol (/\*) or a Javadoc comment start symbol (/\*\*) was not found before the end of a measurement target source file was reached.

#### **Corrective Actions**

Check the comment statements in the measurement target source file.

---

### **STP-010 The measurement target file,[file name], contains an invalid SQL statement (Line [number]).**

There is an error in an embedded SQL statement in the measurement target source file. (This is reported only when the SQL measurement option is specified.)

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

The embedded SQL end symbol (;, END-EXEC, etc.) corresponding to an embedded SQL start symbol (\$, EXEC SQL, etc.) was not found before the end of a measurement target source file was reached.

#### **Corrective Actions**

Check the SQL statements in the measurement target source file.

---

### **STP-011 The file, [file name], has more than 30,000 lines.**

The target file has more than 30,000 steps.

#### **Message output destination**

Display, Error File

#### **Assumed Causes**

Variation measurement measured a source file that has more than 30,000 steps.

However, if [Valid lines only] is selected in the [Measure Variation - Measure] Options Setting dialog box, this message is output if a source file that has more than 30,000 valid lines, excluding comment lines, is measured.

### Corrective Actions

Check the validity of comments with deleted/modified/inserted steps, which have been indicated with "\*\*\*\*".

---

### **STP-012 There are [number] measurement errors. Check the error file.**

There are errors in comment statements or embedded SQL statements in the measurement target source files. Check the error file (Folder set in the "TEMP" environment variable\MF\_STP32.ERR).

### Message output destination

Display

### Assumed Causes

There are errors in the comment statements, embedded SQL statements, or other errors in measurement target source files.

### Corrective Actions

Check the error file and correct the source files with errors.

---

### **STP-013 Unable to output. There are too many lines of code.**

The size or the number of steps in the measurement target source file has exceeded the limit of MF-STEP COUNTER.

Measurement results for size or steps are output as "\*\*\*\*\*" and the percentage is output as "0%".

### Message output destination

Display

### Assumed Causes

File size in bytes (including total size) or number of steps (including total steps and cumulative total steps) have exceeded 99,999,999.

### Corrective Actions

Generate the CSV file and see it to know the value of the part of "\*\*\*\*\*".

---

### **STP-014 Failed to open the CSV file,[file name].**

Opening of the file specified during CSV file creation failed.

### Message output destination

Display

### Assumed Causes

Media defect. (If the storage location is a floppy disk, no floppy disk has been inserted.)

### Corrective Actions

Check whether the folder (drive) where the CSV file is saved is accessible.

---

### **STP-015 Failed to write to the CSV file,[file name].**

Opening of the file specified during CSV file creation failed.

### Message output destination

Display

### Assumed Causes

1. An exclusion error in the CSV file.

2. The folder (drive) where the CSV file is saved has insufficient space.
3. Media defect.

#### Corrective Actions

Check whether the folder (drive) where the CSV file is saved is accessible.

---

#### **STP-016 Error in page specification.**

Incorrect pages were specified in the Specify Page dialog box or the Specify Print Range dialog box from the Windows menu.

#### Message output destination

Display

#### Assumed Causes

1. The numbers of pages specified do not exist in the file created for measurement results.
2. A non-numerical character (including spaces and tabs) was specified.

#### Corrective Actions

Specify the correct page numbers.

---

#### **STP-017 There is an error in the number of copies specified.**

An incorrect number of copies was specified in the Specify Print Range dialog box.

#### Message output destination

Display

#### Assumed Causes

1. A value smaller than 0 was specified.
2. A non-numerical character (including spaces and tabs) was specified.

#### Corrective Actions

Specify the correct number of copies.

---

#### **STP-018 The printer cannot be used.**

The current printer is not ready for use.

#### Message output destination

Display

#### Assumed Causes

The default printer is not set.

#### Corrective Actions

Set the default printer from the control panel.

---

#### **STP-019 Unable to print, there is insufficient disk space for spooling.**

The print spool folder (folder set in the "TEMP" environment variable) has insufficient space and printing is not possible.

#### Message output destination

Display

## Assumed Causes

Insufficient space in the spool folder.

## Corrective Actions

Specify a folder (drive) that has sufficient space in the "TEMP" environment variable.

---

## **STP-020 Unable to print, there is insufficient memory for spooling.**

Memory is insufficient for print spooling and printing is not possible.

## Message output destination

Display

## Assumed Causes

Insufficient memory.

## Corrective Actions

Data exceeding the memory limit cannot be printed.

---

## **STP-021 There is an error in the report type specification.**

There is an error in the document type specification in the measurement options setting dialog box or in the printing dialog box.

## Message output destination

Display

## Assumed Causes

No document was specified (checked) for output or measurement.

## Corrective Actions

At least one document must be specified as the output or measurement target. To cancel the settings in the dialog box, select [Cancel].

---

## **STP-022 The results have not been saved. Save the results now?**

The current measurement results will be discarded. Are you sure?

## Message output destination

Display

## Assumed Causes

When unsaved measurement results were present in the dialog, one of the following operations was performed.

1. [New Measurement] was selected from the File menu.
2. [Read] was selected from the File menu.
3. [Exit MF-STEP COUNTER] was selected from the menu.
4. Windows was shut down.

## Corrective Actions

Select [Yes] to save the results or select [No] to discard them.

---

## **STP-023 There is insufficient memory to display the message.**

There is insufficient memory to generate the message box.

## Message output destination

Error File

## Assumed Causes

Insufficient memory

## Corrective Actions

End other running applications if there are any.

---

### **STP-024 Failed to obtain the TEMP folder.**

The folder name set in the "TEMP" environment variable could not be obtained.

## Message output destination

Display

## Assumed Causes

OS defect.

## Corrective Actions

Check whether the folder (drive) set in the "TEMP" environment variable is accessible.

---

### **STP-025 Opening of the assets folder name file failed.**

Opening of the intermediate file [Asset Folder Name File] used internally by MF-STEP COUNTER failed. Intermediate files are all stored in the folder named [Folder set in the TEMP environment variable\mfstptmp\_32] and deleted together with the mfstptmp\_32 folder when MF-STEP COUNTER is closed.

## Message output destination

Display

## Assumed Causes

1. Intermediate files were deleted during the startup of MF-STEP COUNTER.
2. Media defect.

## Corrective Actions

Check whether the folder (drive) set in the "TEMP" environment variable is accessible.

---

### **STP-026 Opening of the assets file name file failed.**

Opening of the intermediate file [Asset File Name File] used internally by MF-STEP COUNTER failed. Intermediate files are all stored in the folder named [Folder set in the TEMP environment variable\mfstptmp\_32] and deleted together with the mfstptmp\_32 folder when MF-STEP COUNTER is closed.

## Message output destination

Display

## Assumed Causes

1. Intermediate files were deleted during the startup of MF-STEP COUNTER.
2. Media defect.

## Corrective Actions

Check whether the folder (drive) set in the "TEMP" environment variable is accessible.

---

### **STP-027 The specified folder does not exist.**

The specified folder does not exist.

## Message output destination

Display

## Assumed Causes

A folder with the specified name does not exist.

## Corrective Actions

Confirm the existence of the folder.

---

### **STP-028 The specified string is not a folder name.**

The specified string is not a folder name.

## Message output destination

Display

## Assumed Causes

A file name was specified.

## Corrective Actions

Confirm the folder.

---

### **STP-029 A folder with the same name already exists.**

A folder with the same name already exists.

## Message output destination

Display

## Assumed Causes

A folder with the same name already exists.

## Corrective Actions

Specify folders other than the folders that have already been registered.

---

### **STP-030 A lower hierarchy folder of the specified folder already exists.**

A lower hierarchy folder of the specified folder already exists.

## Message output destination

Display

## Assumed Causes

The [Search in sub folders] measurement option for step measurement/variation measurement has been checked.

## Corrective Actions

Delete the lower hierarchy folder or uncheck the [Search in sub folders] measurement option.

---

### **STP-031 A higher layer folder of the specified folder already exists.**

A higher layer folder of the specified folder already exists.

## Message output destination

Display

### Assumed Causes

The [Search in sub folders] measurement option for step measurement/variation measurement has been checked.

### Corrective Actions

Delete the higher layer folder or uncheck the [Search in sub folders] measurement option.

---

### **STP-032 There are no folders registered.**

There are no measurement target folders registered.

### Message output destination

Display

### Assumed Causes

No measurement target folders have been specified.

### Corrective Actions

Specify measurement target folders.

---

### **STP-033 There are no files registered.**

There are no measurement target files registered.

### Message output destination

Display

### Assumed Causes

No measurement target files have been specified.

### Corrective Actions

Specify measurement target files.

---

### **STP-034 The result file format is not supported.**

Unsupported results file format.

### Message output destination

Display

### Assumed Causes

1. Results file created by an unsupported version of MF-STEP COUNTER.
2. The results file could not be found.

### Corrective Actions

Check the specified file.

---

### **STP-035 More than the maximum of number cannot be specified for the identification string.**

It is not possible to specify more than 100 identifiers to use for judging handwritten/auto-generation in auto-generated Java source and Visual Basic 6.0 source files.

### Message output destination

Display

## Assumed Causes

This message is displayed if an attempt to specify more than 100 identifiers is made in the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#).

This message is displayed if an attempt to specify more than 100 identifiers is made in the [\[Step Measurement - Auto-detection \(VB 6.0\)\] Options Dialog Box](#).

## Corrective Actions

Specify 100 or less identifiers.

---

### **STP-036 The identification string already exists.**

The identifier already exists as an identifier used to judge handwritten/auto-generation in auto-generated Java source and Visual Basic 6.0 source files.

## Message output destination

Display

## Assumed Causes

The identifier specified as an additional registration in the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#) already exists.

The identifier specified as an additional registration in the [\[Step Measurement - Auto-detection \(VB6.0\)\] Options Dialog Box](#) already exists.

## Corrective Actions

Check the registered identifiers.

---

### **STP-037 The combination of the identifiers is invalid.FILE:[file name] LINE:No.[number]**

In auto-generated Java source or Visual Basic 6.0 measurement, identifier inconsistencies were detected in the source file.

## Message output destination

Display, Error File

## Assumed Causes

This message is displayed if [Display error for mismatched identifiers] is selected in the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#) or the [\[Step Measurement - Auto-detection \(VB6.0\)\] Options Dialog Box](#). The measurement target auto-generated Java source or Visual Basic 6.0 source file may contain identifier inconsistencies.

1. There are start and end identifiers nested within a start and end identifier pair.
2. The combination of start and end identifiers is invalid.
3. There are end identifiers whose corresponding start identifiers could not be found.
4. There are no end identifiers that correspond to existing start identifiers.

## Corrective Actions

Check measurement target assets (Auto-generated Java Source or Visual Basic 6.0 files) and modify the source file identifiers if necessary.

---

### **STP-038 Reading of the identifier file failed.File:[file name]**

Because the identifier file could not be read, identifiers could not be input.

## Message output destination

Display

## Assumed Causes

One of the following errors may have occurred during reading of the identifier file when reading identifiers from the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#) or the [\[Step Measurement - Auto-detection \(VB 6.0\)\] Options Dialog Box](#).

1. An error in the contents of the identifier file
2. An exclusion error in the identifier file
3. An error in the case of selection of multiple AJD files

## Corrective Actions

Check the identifier file to be read.

---

### **STP-039 Writing to the identifier file failed.File:[file name]**

Because the identifier file could not be written to, identifiers could not be output.

## Message output destination

Display

## Assumed Causes

One of the following errors may have occurred during accessing of the identifier file when writing identifiers from the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#) or the [\[Step Measurement - Auto-detection \(VB 6.0\)\] Options Dialog Box](#).

1. An exclusion error in the identifier file
2. Insufficient space in the output destination folder for the identifier file
3. Media defect in the output destination folder for the identifier file

## Corrective Actions

Check the identifier file to be written to and the output destination folder.

---

### **STP-040 The contents will be erased and identifiers obtained from the file.Are you sure?**

In order to store identifiers in the identifier file, registered identifiers have been erased.

## Message output destination

Display

## Assumed Causes

This is a confirmation message displayed when reading identifiers from the [\[Step Measurement - Auto-detection \(Java\)\] Options Dialog Box](#) or the [\[Step Measurement - Auto-detection \(VB 6.0\)\] Options Dialog Box](#).

## Corrective Actions

When erasing the registered identifiers and reading identifiers for the identifier file, continue processing.

---

### **STP-041 The tag (Starting at line [number]) in the measurement target file, [file name], is incorrect.**

There is an error in a tag statement in a measurement target source file.

## Message output destination

Display, Error File

## Assumed Causes

An end tag to correspond to a start tag was not found before the end of the measurement target source file was reached.

## Corrective Actions

Check tag statements in the measurement target source file.

---

**STP-042 An old result file was read.When measuring by program ID, please review the option settings.**

Because the results file version is old, the [Measure by program ID] measurement option is disabled.

**Message output destination**

Display

**Assumed Causes**

An old version of the results file from measurement of COBOL was read.

**Corrective Actions**

The [Measure by program ID] measurement option is disabled.

To perform measurement by program ID, enable this option and measure all.

---

**STP-043 An old result file was read.When measuring the header file (\*.h) as program step information, please review the option settings.**

Because the results file version is old, the [Measure header files (\*.h) when the folder is specified] measurement option is disabled.

**Message output destination**

Display

**Assumed Causes**

An old version of the results file from measurement of C/C++ was read.

**Corrective Actions**

The [Measure header files (\*.h) when the folder is specified] measurement option has been disabled.

To also measure header files (\*.h), enable this option and measure all.

---

**STP-044 An input/output error occurred during code conversion of the measurement target file,[file name].**

An error occurred during character code conversion of a measurement target file.Confirm that the file is not corrupt or does not conflict with restrictions.

**Message output destination**

Display, Error File

**Assumed Causes**

When measuring assets that conflict with restrictions of the target assets or when the measurement target assets are exclusively grabbed by another application.

**Corrective Actions**

Include the -FORCE option to the start option to continue the measurement.

---

**STP-045 The contents will be erased and extensions obtained from the file.Are you sure?**

In order to store extensions in the extension file, registered extensions will be erased.

**Message output destination**

Display

**Assumed Causes**

This is a confirmation message displayed when reading extensions from the [Common - Extension] Options.

## Corrective Actions

When erasing the registered extensions and reading extensions for the extension file, continue processing.

---

### **STP-046 Reading of the extension file failed.FILE:[file name]**

Because the extension file could not be read, extensions could not be input.

#### Message output destination

Display

#### Assumed Causes

One of the following errors may have occurred during the reading of the extension file when reading extensions from the [\[Common - Extension\] Options](#).

1. An error in the contents of the extension file
2. An exclusion error in the extension file
3. An error in the case of selection of multiple AJD files

#### Corrective Actions

Check the extension file to be read.

---

### **STP-047 Writing to the extension file failed.FILE:[file name]**

Because the extension file could not be written to, extensions could not be output.

#### Message output destination

Display

#### Assumed Causes

One of the following errors may have occurred during accessing of the extension file when writing extensions from the [\[Common - Extension\] Options](#).

1. An exclusion error in the extension file
2. Insufficient space in the out destination folder for the extension file
3. Media defect in the out destination folder for the extension file

#### Corrective Actions

Check the extension file to be written to and the output destination folder.

---

### **STP-048 More than 10 extensions cannot be specified in the extension string.**

Up to 10 additional extensions can be specified for each language type/language category.

#### Message output destination

Display

#### Assumed Causes

More than 10 extensions were added in the Extension column in the extension specification dialog.

#### Corrective Actions

Specify 10 or less extensions.

---

### **STP-049 Please specify the extension string using between 1 and 10 characters.**

Please specify the extension string using between 1 and 10 characters.

## Message output destination

Display

## Assumed Causes

An extension with more than 10 characters was specified in the extension string.

## Corrective Actions

Specify extension strings using 10 or less characters.

---

### **STP-050 There is an invalid character in the extension.**

There is an invalid character in the extension.

## Message output destination

Display

## Assumed Causes

The extension string contains one or more of the following characters.

<>/\|: " \* ?

## Corrective Actions

Check for invalid characters and modify the extension string.

---

### **STP-051 Japanese characters (2-bytes) cannot be specified.**

Japanese characters (2-bytes) cannot be specified.

## Message output destination

Display

## Assumed Causes

The extension string contains Japanese or other two-byte characters.

## Corrective Actions

Erase Japanese or other two-byte characters from the extension string.

---

### **STP-052 The extension already exists.**

The extension already exists.

## Message output destination

Display

## Assumed Causes

The extension string contains an overlapping extension.

## Corrective Actions

Erase the overlapping extension from the extension string.

---

### **STP-053 It is already specified in the same language category record.**

It is already specified in the same language category record.

## Message output destination

Display

### Assumed Causes

The extension has already been specified for the language category specified.

### Corrective Actions

Review file extensions.

---

### **STP-054 The development language of the file,[file name], cannot be identified.**

When specifying assets by file, the extension of the measurement target source files cannot be identified.

### Message output destination

Display

### Assumed Causes

The extension of the file selected by the file specification does not correspond to any of the file extension registered as each language type.

### Corrective Actions

Specify the file that corresponds to one of the file extensions registered as each language type for the file selected by the file specification for the measurement target.

---

### **STP-055 Multiple starts are prohibited.**

The repetition starting cannot be done when there is an active process (It cannot executed by GUI and a batch).

### Message output destination

Display

### Assumed Causes

There is an active process.

### Corrective Actions

Please use the Process that started previously.

---

### **STP-056 Use in the trial version is not possible.**

This feature cannot be used in the trial version.

### Message output destination

Display

### Assumed Causes

This feature cannot be used in the trial version.

### Corrective Actions

Please buy a formal version.

---

### **STP-057 Unable to find the file.**

Unable to find the file.

### Message output destination

Display

### Assumed Causes

The File of the measurement object was deleted or moved.

## Corrective Actions

Please specify the File of the measurement object.

---

### **STP-058 Error in the number of files.**

Error in the number of files.

## Message output destination

Display

## Assumed Causes

Measurement result File (\*.stp) is damaged, and the content is unmatched.

## Corrective Actions

Please read normal measurement result File (\*.stp).

---

### **STP-059 Please specify a folder name.**

Please specify a folder name.

## Message output destination

Display

## Assumed Causes

The folder name is not specified.

## Corrective Actions

Please specify the folder name.

---

### **STP-060 Creation of header control failed.**

Creation of header control failed.

## Message output destination

Display

## Assumed Causes

Creating header control is failed because of the environment or the data of unmatched.

## Corrective Actions

Please reboot the re-measurement or reboot the Program.

---

### **STP-061 Creation of list control failed.**

Creation of list control failed.

## Message output destination

Display

## Assumed Causes

Creating header control is failed because of the environment or the data of unmatched.

## Corrective Actions

Please reboot the re-measurement or reboot the Program.

---

**STP-062 Failed to secure memory.**

Failed to secure memory.

**Message output destination**

Display

**Assumed Causes**

Memory shortage.

**Corrective Actions**

Please clear the memory and measure again.

---

**STP-063 Select one line to change.**

Select one line to Change Extensions.

**Message output destination**

Display

**Assumed Causes**

[Change] was selected by the state for which the extension was not specified.

**Corrective Actions**

Please select the extension that changes.

---

**STP-064 The same file name already exists.**

The same file name already exists.

**Message output destination**

Display

**Assumed Causes**

The same name of file has already been registered.

**Corrective Actions**

Please select other Files.

---

**STP-065 The contents will be erased and extensions initialized. Are you sure?**

Information on the changed extension is returned to the state at the installation.

**Message output destination**

Display

**Assumed Causes**

[Initialization] was selected in the [Common - Extension] options dialog box.

**Corrective Actions**

Please execute the as needed after often confirming the initialization of the extension with the manual.

---

**STP-066 Please specify the language type.**

Please specify the language type.

### Message output destination

Display

### Assumed Causes

When the extension is changed, the language kind is not specified.

### Corrective Actions

Please specify the language kind.

---

### **STP-067 The size of measurement target file ,[file name], exceeds the limit.**

It cannot measure because the size of the measurement target file exceeds the limit (4GB).

### Message output destination

Display, Error File

### Assumed Causes

The file with the size exceeding the limit (4GB) was specified as the measurement target file.

### Corrective Actions

Check the size of specified measurement target file.

# Chapter 10 Samples

This chapter explains the samples provided with MF-STEP COUNTER.

## 10.1 Sample Usage

When STEP COUNTER is installed, the "SAMPLE\en" folder is created inside the installation folder and sample source files of various language categories are stored.

[Samples for Step Measurement]

File Name	Character Code	Description
sample.c	UNICODE	<a href="#">4.1.3 C/C++ Measurement Criteria</a>
sample.cob	UNICODE	<a href="#">4.1.2 COBOL Measurement Criteria</a>
sample.java	UNICODE	<a href="#">4.1.4 Java Measurement Criteria</a>
Generation_sample.java	UNICODE	<a href="#">4.1.5 Auto-generated Java Source Measurement Criteria</a>
sample.idl	UNICODE	<a href="#">4.1.6 IDL Measurement Criteria</a>
sample.html	UNICODE	<a href="#">4.1.7 HTML/JSP/JS/CSS Measurement Criteria</a>
sample.vb, sample.cs, sample.asp, sample.aspx	UNICODE	<a href="#">4.1.8 .NET (ASP/C#/VB)/HTML/JS/CSS Measurement Criteria</a>
sample.frm	UNICODE	<a href="#">4.1.9 Visual Basic 6.0 Measurement Criteria</a>

[Samples for Variation Measurement]

File Name	Character Code	Description
CompSamle_old.java, CompSamle_new.java	UNICODE	<a href="#">4.2 Variation Measurement Criteria</a>

These source files correspond to the examples given to explain measurement criteria.

### To Measure Steps

1. Select the [New Measurement] command from the [File] menu.
2. In the [New Measurement 1/2 Dialog Box](#), select [Steps] under [Measurement Type]. Select the desired language category for measurement under [Language Category], [File] under [Target Resource Specification Method], and [UNICODE] under [Character Code], and click the [Next] button.
3. In the [New Measurement 2/2 Dialog Box](#), specify the measurement target source file or the folder in which the source file is located.
4. Click the [Finish] button to start measurement, and then the measurement results are displayed on screen.

### To Measure Variation

1. Select the [New Measurement] command from the [File] menu.
2. In the [New Measurement 1/2 Dialog Box](#), select [Variations] under [Measurement Type]. Select the desired language category for measurement under [Language Category], [File] under [Target Resource Specification Method], and [UNICODE] under [Character Code], and click the [Next] button.
3. In the [New Measurement 2/2 Dialog Box](#), specify the old and new measurement target source files.
4. Click the [Finish] button to start measurement, and then the measurement results are displayed on screen.

### To Change the Display Format (Step Measurement Only)

1. Select the [Step Measurement - Display] options configuration command from the [Options] menu.

2. In the [\[Step Measurement - Display\] Options Dialog Box](#), select [Form] or [List view] under [Display Initial Dialog].
3. If list view mode is selected, the items to be initially displayed can be selected in this dialog.
4. If form mode is selected, select the [Form] tab in the step measurement options dialog box to open the [\[Step Measurement - Form\] Options Dialog Box](#) and select the information to be displayed.
5. Select the [Measure Changed] command from the [Measure] menu to update the display format without performing remeasurement.
6. From the [Display] menu, it is possible to select whether to display or hide display items. For details, refer to [6.1.3 \[Display\] Menu](#).

### To Print Measurement Results (Step Measurement Only)

1. To print measurement results, display the results in form mode. In list view mode, the results cannot be printed (To print, save the results as a CSV file as described later, and print it using an application such as spreadsheet software).
2. Select the [Print] command from the [File] menu.
3. In the [Print Dialog Box](#), set the necessary items and click the [OK] button.
4. The measurement results are sent to the printer.
5. For details, refer to "[Printing Measurement Results](#)".

### To Save Measurement Results as a CSV File

1. Select the [Save As CSV File] command from the [File] menu.
2. In the [Save As CSV File] dialog box, specify the CSV file name and click the [Save] button.
3. A CSV file with the specified name is created.

When the measurement results are displayed in list view mode, individual lines can be selected to output only the relevant information.

1. Select the measurement results to be output to a CSV file from the list view (multiple selections are possible).
2. Select the [Save Selected Range As CSV File] command from the [File] menu.
3. In the [Save As CSV File] dialog box, specify the CSV file name and click the [Save] button.

When saving a CSV file, the saved format varies depending on how the measurement results are displayed. Refer to [Form CSV File](#) or [List View CSV File](#).

### To Save Measurement Results

1. Select the [Save As] command from the [File] menu.
2. In the [Save Measurement Results File] dialog box, specify the measurement results file name and click the [Save] button.
3. A measurement results file with the specified name is created.

When assets were changed or measurement results were updated, select the [Save] command from the [File] menu.

### To Read the Measurement Results File

1. Select the [Read] command from the [File] menu.
2. In the [Read Measurement Results File] dialog box, select the measurement results file and click the [Open] button.
3. The measurement results saved in the measurement results file are displayed on screen.

### Attention

When COPY phrase files or include files are used in the measurement target source, set [\[Step Measurement - Search Path\] options](#) before measurement.
