Co-creation for Success

Blockchain to drive innovation

Peter Eneqvist

Head of Financial Services

Fujitsu Sweden

Mikael Söderman

Blockchain Expert and Solution Design Architect

Fujitsu Sweden

From Fujitsu latest research

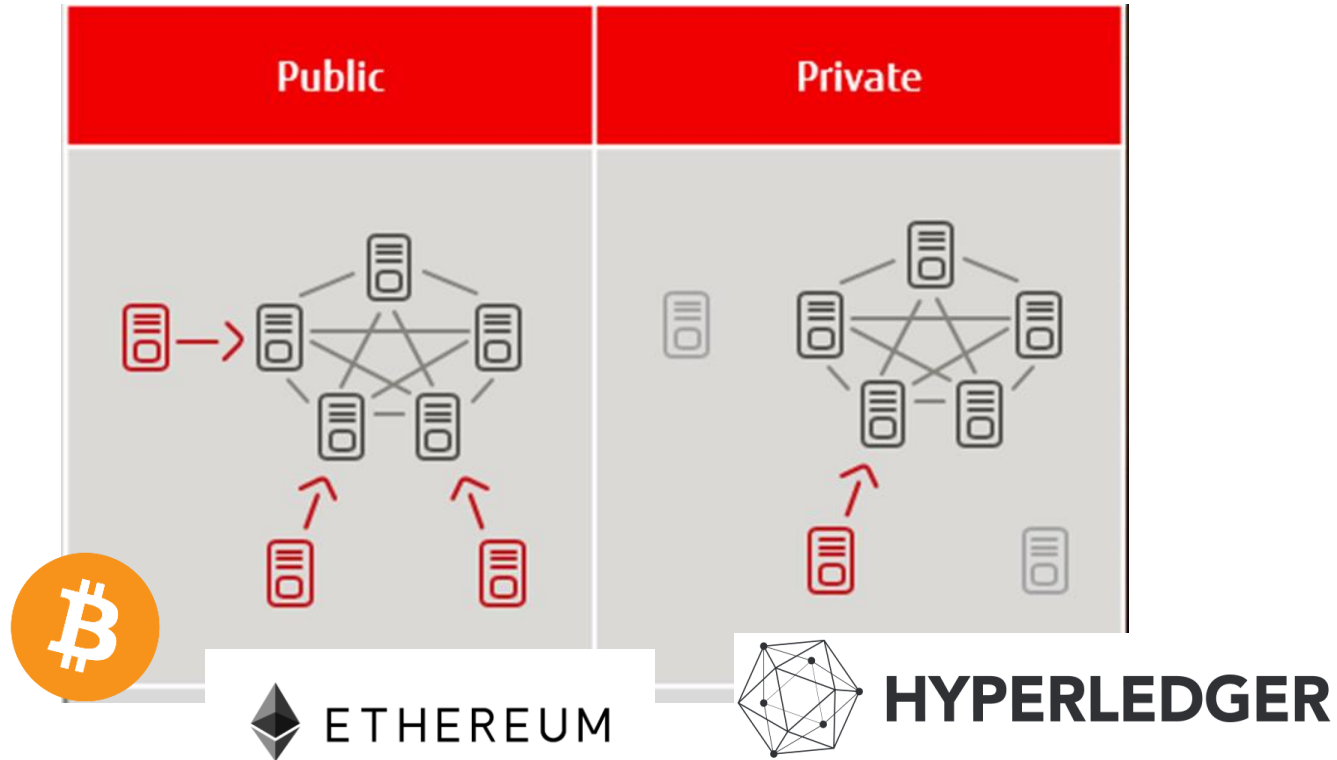

- Most business initiatives on blockchain focus on current business processes and models. Projects of companies applying peer-to-peer-decentralized models without intermediaries are rare.
- There are many pilot projects in progress in several industries, but it is expected that many of these will fail in the coming years due to insufficient requirements or suitability of selected technologies.
- Financial Services and Government institutions will have the fastest adoption rate of Blockchain and will also have a more transformational impact on their businesses.
- By 2022, more than a billion people will have some data about them stored on a blockchain, but may not be aware of it.
- There are generally positive prospects about blockchain globally, but the approach and rules for crypto currencies vary greatly.
- Japan is the largest market for crypto-currency in the world, with 61% of the global trade volume of Bitcoin.

What is blockchain?

Distributed database in which all data modifications are chronologically ordered and cryptographically secured

Public and private blockchains

Blockchain success factors

- Several parties involved
- Exchange of unique digital assets
- Realtime data access
- Data and transaction transparency
- Not possible to manipulate data
- Data should be traceable
- Traditionally a third party is needed for verifying data
- 24/7 availability

Unsuitable Blockchain use cases

- High speed transaction: Limited number of transactions per seconds
- Fast finality for transaction: Potentially some delay until a transaction is finalized
- Large Document Storing: Not suitable for storing large documents
- Use in single or small organization: Blockchain technology is in general most suitable for value exchange between multiple organizations or stakeholders
- Replacement of existing system: for example databases or messaging middleware

Potential blockchain benefits

A stylized globe with a digital network overlay, representing global connectivity and blockchain technology. The globe is composed of a grid of points and lines, with a warm orange glow on the left side and a cool blue glow on the right side. The background is dark blue with faint, glowing lines and dots, suggesting a global network or data flow.

- No single point of failure
- Saves time
- Decreased costs
- Reduced risk
- Increased trust

Expected use cases for blockchain

Virtual
Currency

Money
transfer

Stock
exchange

Asset
Management

Contract
Management

Insurance
Contract

Trade
Financing

Supply chain
Management

IoT

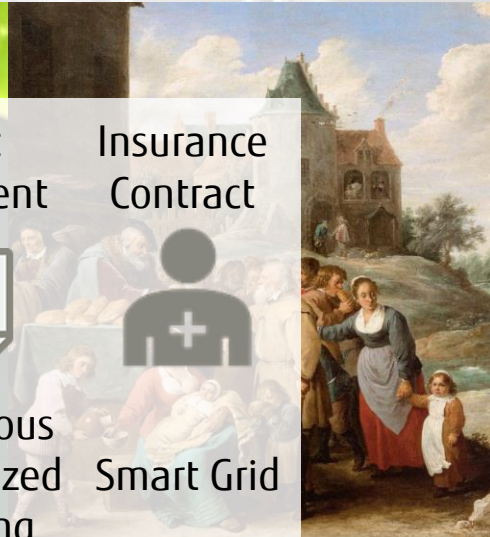

Identity
Verification

Autonomous
Decentralized
Processing

Smart Grid

Fujitsu Enterprise Blockchain

- Blockchain-as-a-Service on Fujitsu Cloud Service K5
- Ready to use REST API for digital assets management in your business
- Basic functions provide as All-In-One
 - Management UI for blockchain dashboard, user control and etc
 - Data concealing function for safety transaction
 - Large data store for documents

Hyperledger Fabric

Fujitsu Enterprise Blockchain

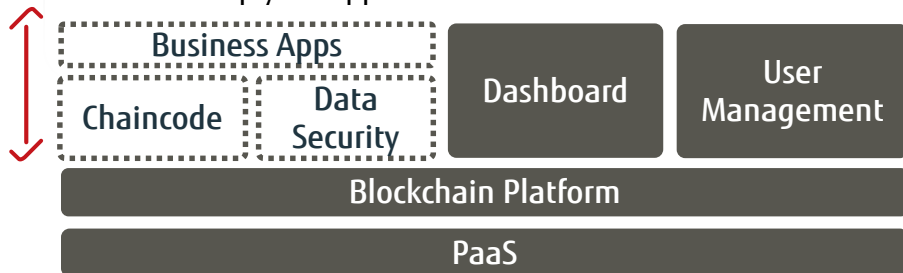

■ Able to focus on:

- designing business model
- developing business application

Building your own Blockchain platform

- To develop Chaincode
- To ensure Data Security
- To develop your apps

Fujitsu Enterprise Blockchain

- To develop your apps
- To engage your customers

Fujitsu Blockchain Innovation Centre

To create relevant knowledge and know-how to enable the application of Blockchain for the realization of Smart Cities

- Project is focused on technical and non-technical elements with regards to Blockchain, including:
 - Decision and process modelling
 - Business engineering
 - Use cases (City of Brussels and Citizen Participation)
 - Technical baseline (Hyperledger Fabric)
- The approach and business engineering developed will be useable in a broad spectrum of sectors (manufacturing, government, Financial, services, etc.)
