

# Human Centric ICT System

## Fujitsu RunMyProcess showcases Internet of Things

As part of its dedication to be a leading Internet of Things (IoT) technology innovator, Fujitsu has created a live showcase of its Human Centric Innovation strategy. In this showcase the **Fujitsu RunMyProcess cloud platform** is used to connect wearables, sensors, mobile devices and cloud services in order to transform the end to end emergency response for a critically injured cyclist.

In the demonstrated scenario, information from a range of **HOP Ubiquitous** personal sensors is correlated within a smart watch. Whenever a potential accident is detected an alert is sent to the Fujitsu RunMyProcess cloud platform. From there, the platform orchestrates the end to end emergency response: notifying the emergency services, routing the ambulance using smart traffic data, providing accident and medical information to paramedics on tablets and finally monitoring the evolving traffic situation to minimize the delay in getting to the allocated hospital.

The technologies involved in the demonstration are real and publically available - including commercial sensors, smart city data from Santander, European standards for both emergency services (EENA) and health record access (EPSOS) and finally the Fujitsu RunMyProcess cloud platform itself.

### Internet of Things saving lives today

The Internet of Things (IoT) offers huge new potential benefits for the economy and for society. Important new standards are enabling people, data and systems to communicate with each other more effectively, creating new opportunities to make a huge range of services safer, more efficient and more human centric.

### Award winning demo

The demonstration was previously showcased at the **"4th International Conference on The Internet of Things" at MIT**, where Fujitsu and its collaborators - HOP Ubiquitous and HES-SO - received the prestigious "Best Demonstration" award.
