

Fujitsu Cloud Global Cloud Platform

shaping tomorrow with you

Fujitsu Cloud Global Cloud Platform

Fujitsu delivers flexible, virtual technology infrastructure which you can configure, deploy, and scale quickly on-demand. With Fujitsu you can deliver applications and services from our data centers around the globe.

To remain competitive, organizations must be able to quickly deliver new products and applications, and cope with peaks and troughs in business demand. IT departments must maximise flexibility while minimising capital expenditure and operating costs.

In response to these demands, organizations are changing the way they look at technology. Rather than maintaining their own infrastructure, organizations are looking to acquire technology services as they are needed and pay only for the resources they consume. This model, often referred to as 'cloud' infrastructure, has three distinct characteristics:

- The technology is hosted and managed by the service provider and customers only pay for the resources they use
- The services are modular, flexible and scalable – to cope with changing business needs
- Self-service technologies allow customers to deploy and manage systems independently of the service provider

Many service providers provide cloud services from data centers located in a single country. However, this does not necessarily address the needs of multinational organizations or software developers looking to deploy cloud-based applications to global markets.

Fujitsu currently offers six Global Cloud Platform data centers across the Asia-Pacific region, Europe, Japan and the United States. This means you can deliver high-performance applications no matter where your end-users or customers are located.

Fujitsu Global Cloud Platform

Fujitsu pay-per-use Global Cloud Platform makes it possible for your organization to dynamically scale its IT environment in real time based on business demand.

Using our Design Studio, your organization can quickly and easily design and deploy virtual technology environments.

As a trusted IT services provider, Fujitsu can give your organization enterprise-class security, highly available via the cloud.

Greater flexibility for a range of needs

With Fujitsu Global Cloud Platform, you can set up a unique and dedicated virtual system environment to suit your organization's needs. Potential uses for these virtual system environments include:

- **Test and development.** Rapidly acquire and release server and development platform resources to keep costs down.
- **New services.** Test the effectiveness and business viability of new initiatives in a small environment with minimum risks and determine the volume of IT resources you may need before launching the new service. You can also acquire additional resources as the service grows.

Everything you need is built in

Fujitsu Global Cloud Platform delivers:

- **Simplified design.** Select system configurations from a library of system templates. With our Design Studio, you can easily choose the operating system, middleware and configuration for each system, and quickly add or remove virtual servers, storage and network infrastructure.
- **Built-in security.** Our services have been designed for security, with VPN connections, firewalls and DMZ capabilities for internet accessible servers.
- **Services on-demand.** Time-based billing allows you to use the virtual machines efficiently.
- **Self-service.** Through our Dashboard, you can monitor the operational status of infrastructure and perform management operations such as starting, stopping, backing up and restoring virtual machines.
- **Safety and reliability.** Our service uses clustering to protect data and maintain the performance and uptime of virtual machines.

Benefits

With Fujitsu Global Cloud Platform, your organization can:

Match IT spending to business demand

Rapidly respond to changing business needs and market conditions by scaling your organization's usage up or down on the fly.

Reduce technology management costs

Design, deploy and manage entire virtual system environments using simple, secure tools accessed through a web browser.

Maintain availability of vital applications

Our virtual systems are guaranteed to be highly available, backed by solid service level agreements. If one of the physical systems fails, the virtual machines hosted on it are automatically transferred to another server.

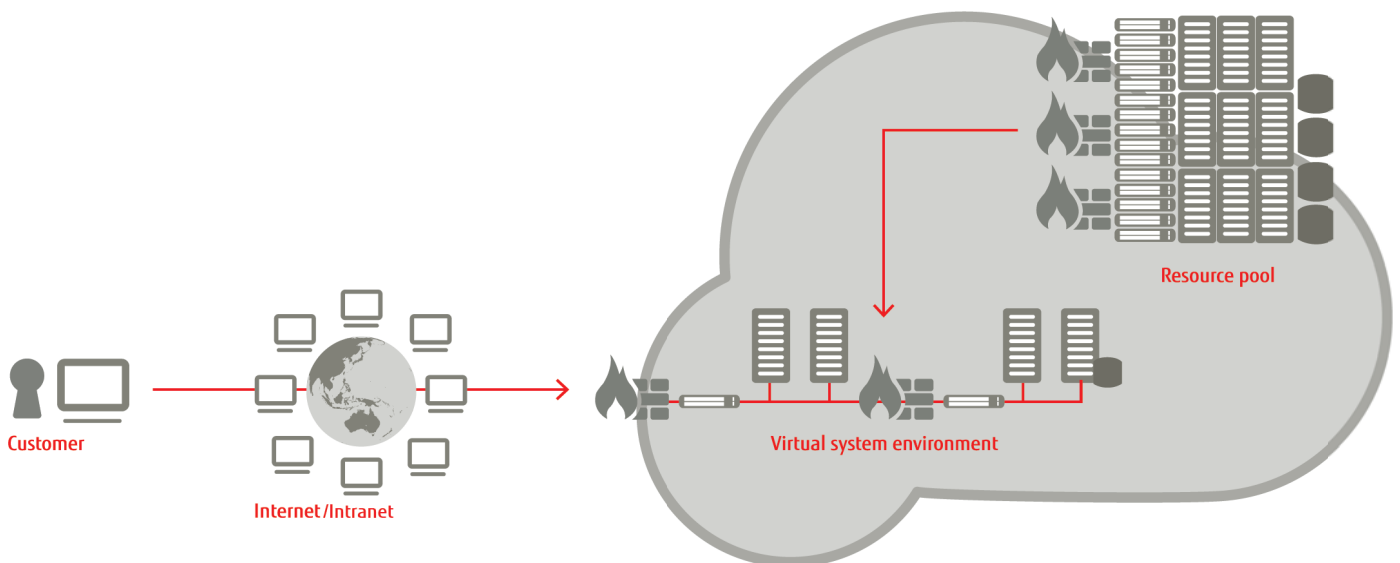

Protect critical business data

Your data is kept on enterprise-class virtual storage with multiple physical disks, protecting against data loss. Data is protected in transit over networks and the internet using firewalls and VPN technology.

Achieve global reach

With six data centers globally, Fujitsu can deliver your business service or application to customers or users around the world.
