Fully flexible workplace without compromising security

Fujitsu Fabric enables the delivery of a fully flexible training and simulation environment giving your people instant, secure access to the training and simulation resources they need, when and where they need them. The result is the delivery of a Force Multiplier effect by optimising the provision of existing and future training and simulation resources.

- A secure cloud-based training environment designed and built with the highest possible levels of security at its heart;
- Anytime, anywhere access from any device, replacing the traditional classroom approach with a virtual classroom;
- Adaptable, agile solution delivering training and simulation exercises in real-time with the ability to change the scenarios ‘in-flight’;
- In-built licence management and monitoring ensures transparency and full accountability to evaluate effectiveness of every training exercise;
- Fully maintained and supported by Fujitsu’s global capabilities, conforming to the Ministry of Defence’s Defence Line of Development capability integration.

Effectively creating a virtual classroom, Fabric delivers a Force Multiplier by significantly increasing the effectiveness of your training and simulation provision, while reducing expensive hardware costs. The latest apps and training software can be delivered with complete security, allowing users to access and share information with ease, across any device. Important operational demands can therefore be met in a controlled manner with very short notice, which is crucial for the constantly changing environment of Defence and National Security.
Training
Fujitsu Fabric enables your people to gain instant, secure access to the training resources they need, when and where they need them. Training scenarios can be delivered in real-time, with the capability to change the scenarios ‘in-flight’ to make the exercise as realistic as possible to the situations the users are likely to encounter. Users can even pause a scenario on one device, and pick up where they left off on another device, at a time and place that suits them.

Simulation
With NVIDIA 3D graphics as standard Fujitsu Fabric enables users to access multimedia rich applications to deliver real-life simulation activities, wherever they are, whenever they want. This reduces the reliance on dedicated, ultra-expensive simulation machines, and eliminates the time and expense of users needing to travel to use such facilities.

Full control and accountability of your training provision
Your training provision becomes much more manageable and transparent with Fujitsu Fabric, ensuring you’re in complete control of your training delivery. Real-time licence management allows you to monitor usage, and ensures you only pay for what you use. Meanwhile, built-in compliance and monitoring keeps you in full control ensuring you can assess, evaluate and fully cost every training activity and simulation exercise, and eradicate inactive licence costs.

Such insight enables the accurate costing of individual activities allowing informed decisions to be made to improve the cost effectiveness of your future training and simulation investments. The result is full control and accountability of decision making, and a Force Multiplier effect for the Defence and National Security sectors. Fujitsu understands the modern-day complexities and challenges facing military organisations and intelligence communities. As a result of our work across Defence and National Security we have an excellent insight in to the challenges that surround the ‘joining up’ of information across many large agencies in order to respond effectively to any situation.

Complete cybersecurity built in to the core
Unlike many other cloud-based workplace solutions Fujitsu Fabric has been designed and built with security at its heart. Throughout the design phase, Fujitsu has consulted extensively with CESG, the Information Security arm of GCHQ, and the definitive voice on the technical aspects of information security in Government. The result is that Fabric has full cybersecurity capabilities built in to its core, making it an ideal ‘virtual classroom’ solution for the Defence and National Security sectors.

Dynamic, continual development
Fujitsu’s dynamic approach ensures Fabric is continually developed and takes advantage of leading edge technology and commercial-off-the-shelf (COTS) products from our long-standing partnerships with Brocade, Citrix, NVIDIA and RES. This continual development keeps costs to a minimum and ensures you are always able to keep up with resource-hungry training and simulation software as it develops, keeping expensive software licensing and hardware refresh costs to a minimum. Again, this has the potential to deliver a Force Multiplier by future-proofing your investments, ensuring the cost-effective delivery of training and simulation activities to dispersed groups of people.

Enabling secure anytime access from anywhere
Expensive thick client solutions associated with the traditional classroom are replaced with an agile, thin client approach that is device-agnostic. Device options include laptops, smartphones and tablets, enabling your people to access your training resources flexibly wherever they are, whatever they are doing. This flexibility in no way compromises security. Fujitsu Fabric allows identification and access management (IDAM) in line with MOD IS strategy. Fabric acts as the secure access broker allowing any approved device and its user to directly link to the appropriate training and simulation resource with approved access rights. Each user has a unique personal identifier to logon to Fabric from their device. So your people have instant, secure access to the training and simulation resources they need, when and where they need them – even in the comfort of their own home.

Why Fujitsu?

Enabling information to be the real Force Multiplier
Providing highly secure, seamless access to training and simulation resources is another example of how Fujitsu can deliver a real Force Multiplier effect for the Defence and National Security sectors. Fujitsu understands the modern-day complexities and challenges facing military organisations and intelligence communities. As a result of our work across Defence and National Security we have an excellent insight in to the challenges that surround the ‘joining up’ of information across many large agencies in order to respond effectively to any situation.

That’s why partnering with Fujitsu can help to improve the quality of your information and how you use it. By exploiting a wide range of ICT-based solutions – like Fabric - we enable this information to deliver a real Force Multiplier effect, dramatically increasing the efficiency and effectiveness of your Force’s limited resources.

We’re expanding our Global Defence and National Security portfolio, supporting customers across Europe, the Middle East and India, Asia Pacific, Canada and the USA. Our commitment to military deployed infrastructure is unrivalled among ICT companies and we provide the same high level of support to Defence and National Security customers wherever they are, be that in the office, at headquarters, on the road, on foot, at sea, in the air or in combat.
