## Getting Information into the Patient Chart

A patient's health story is complex and difficult to piece together. As a healthcare practice, receiving various clinical document formats from countless delivery methods (i.e., paper, fax, secure messaging, portals, etc) is overwhelming and inefficient. It's far too easy to miss vital information.

With Kno2, you can consolidate every source used today for the purpose of exchanging patient information into a single interface and a single process. Kno2 simplifies sending, receiving, processing and storing information into your patient charts, whether they are residing in your EMR, network storage or paper.

By standardizing the process for receiving, managing, filing and sending patient information you'll get control, remove the headaches and complexities of having multiple ways to get this done, and get more accurate, centralized and complete patient records. All this comes from boiling it down to one interface and one process... that you control.

## Sending Patient Information

To build a meaningful patient health story, sending usable and sustainable clinical content is critical.

Kno2's Clinical Document Exchange (CDE) platform allows you to send documents from any source into a smart, healthcare compatible output. Kno2 simplifies and automates complicated, slow and frustrating healthcare workflow processes.
