Kno2™ | Inofile™

Creating Vital Links to Simplify Healthcare.™

Kno2™ is an easy-to-use, cost-effective, cloud-based software application that creates a groundbreaking "on-off-ramp" between sources of "unstructured" clinical information and various health information exchange networks, as well as Electronic Medical Record Systems (also known as EMRs).

Kno2, like all Inofile products, is designed especially for healthcare providers challenged by lack of investment dollars for technology purchase, those without technical or IT resources or those burdened with technology that's out-of-date. Kno2 makes it easy for all healthcare organizations to integrate effectively into today's evolving, increasingly complex healthcare ecosystem.

For healthcare providers currently using paper-based records:
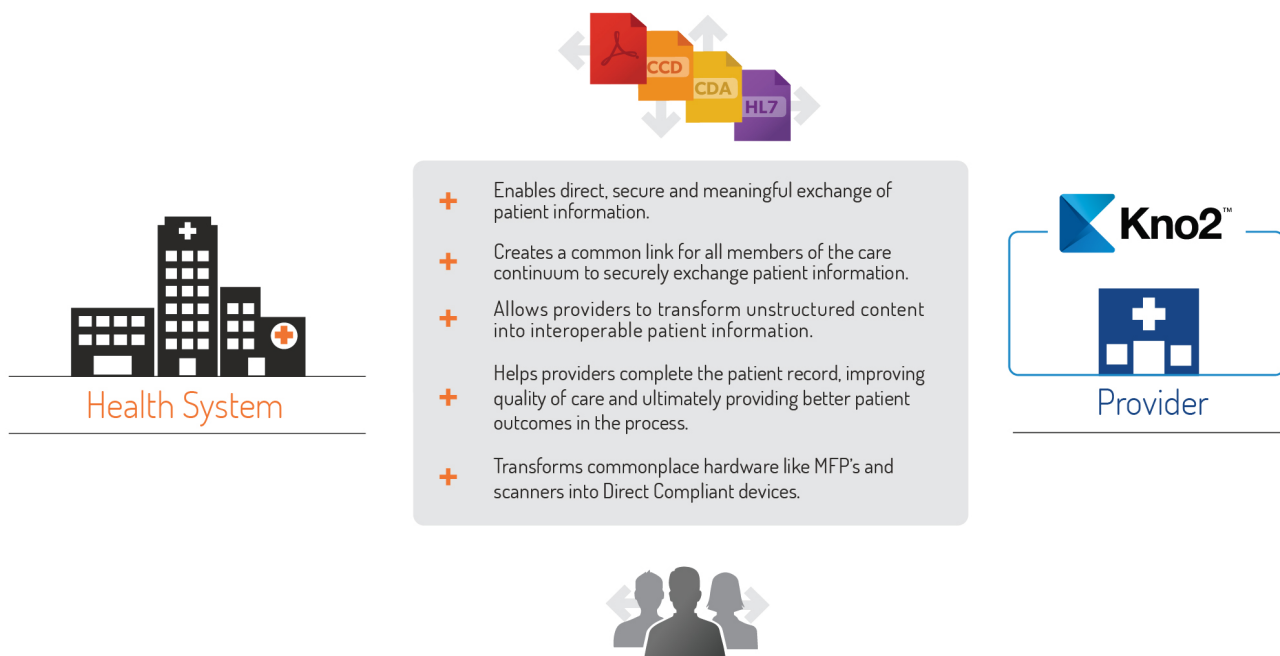

- Scan and immediately convert paper to healthcare-compatible formats, and a Direct Message – using common scanning devices

- Receive Direct Messages with attachments and convert immediately to a print-ready format or PDF for filing back to your patient chart

For healthcare providers using an EMR that is not currently compatible with Direct Messages:

- Download and send documents created in your EMR

  - This includes PDFs, CCDs, and other structured documents such as a minimum data set (MDS)

- Use common scanning devices to capture paper based information and easily attach it to a Direct Message suitable for transfer to other healthcare providers

- Receive Direct Messages with attachments and upload to your EMR with ease (including PDF, XDS-SD)

HOW KNO2 WORKS

Kno2 improves the exchange of patient information with a simple, affordable solution that plugs into the organization's normal ways of working. Kno2 also easily adapts to any clinical workflow because we've designed Kno2 around the way people work today. Equally important, we've designed Kno2 for the very near reality of Direct Messages being the universal healthcare standard for information exchange.

Health System

+ Enables direct, secure and meaningful exchange of patient information.

+ Creates a common link for all members of the care continuum to securely exchange patient information.

+ Allows providers to transform unstructured content into interoperable patient information.

+ Helps providers complete the patient record, improving quality of care and ultimately providing better patient outcomes in the process.

+ Transforms commonplace hardware like MFP's and scanners into Direct Compliant devices.

Provider

KNO2 BENEFITS

- Improves timeliness, accuracy, security and "structure" of vital patient information used within any healthcare community

- Ensures compatibility and compliance with latest healthcare technology standards and practices including Meaningful Use Stage 2

- Supports Direct Messages by intelligently automating the receipt and delivery of messages with attachments across a secure point-to-point Direct-compliant network

- Enables care providers to securely send and receive patient information via standards-based formats and methods using many of the devices they use every day

- Enables faster, more accurate transfers of care, referrals and other record-sharing activities with outside providers and partners by sending and receiving Direct Messages
